However, this year the snowfall has been so light that Western ranchers are all worried. Jack Kippen, whose ranch we visited, was hauling water 30 miles to his sheep. The day we were there the sheep were grazing in the foothills of the mountains where there was a little snow and Jack said that day they must depend on the snow and would have no water given them. All through the West, ranchers are worrying about the light snowfall this past winter.

With the exception of permanent winter pastures and winter grains, particularly barley, everything that grows in California is irrigated. Unfortunately, there just is not sufficient water to go around, therefore, many areas in all the western states never can be irrigated. As you might readily imagine, disputes over water are common. In these days they are not settled with a "six-shooter." Now the disputes are between areas and they are argued before government officials or the courts.

We asked whether there is a general appreciation of the seriousness of the water situation by urban residents, and were given a flat "No" for an answer. "In fact," said one of our new friends, "most city people feel that anyone who mentions the possibility of a water shortage is uttering words close to treason."

Pests and Parasites

Western ranchers have their pests just as we do in the East. Utah sheep owners kill rabbits with poisoned alfalfa. We were told that five rabbits would eat as much as one sheep, and feed was too scarce to waste. In the

"Look—neighbors!"

irrigated area around Sacramento, California, where grass is more plentiful, Howard Vaughn, President of the National Wool Growers Association, told us that coyotes were a real problem, and, on the 300,000 acre Fernandez Ranch about 100 miles west of Albuquerque, New Mexico, we found that an experienced trapper, hired full time to exterminate coyotes and bobcats, had caught about 200 since last fall. We saw a bobcat caught in a trap. He was an exceedingly vicious looking individual.

The chief means of killing coyotes is ingenious. An iron peg, hollow at the top and containing a trigger and firing pin, is driven in the ground. A cyanide cartridge is inserted and on top of this is a scented rag. The curious coyote pulls at the rag; the cartridge is discharged, and he gets a dose of cyanide in the mouth, takes off across the plains for about 60 yards and then topples over dead.

The trapper told us how he trained dogs to avoid these deadly contraptions. Instead of cyanide he uses red pepper. "When a pup gets one of those in the mouth," said the trapper, "he starts off across the range with his tail between his legs—not between his hind legs but between his front legs. Once he tries it he is cured forever."

Lariats Almost Obsolete

At the ranch of J. Sheldon Potter near Merced, California, we saw beef steers, both Hereford and Angus, being put through a chute, where their backs were sprayed with a solution containing rotenone to kill ox-warble grubs and each animal was given a capsule containing phenothiazine for internal worms. While the steers are brought into the corral by cowboys on horses, they seldom use lariats.

One of the worst parasites in the West is the screw worm. There is no way to prevent these flies from laying eggs on any wound which an animal may have, and as some of our western friends told us, once they get started they practically eat an animal alive.

Price Support Objections

We asked farmers in Illinois, Colorado, Utah, California, Arizona, New Mexico, Oklahoma and Missouri for their views on price supports. C. B. Watson, DeKalb County, Illinois, has a 640 acre farm, raises a lot of corn and buys beef cattle in North Dakota for fattening. He told us that much of the corn he grew last year is sealed at the government support price of \$1.39 a bushel, and that he had purchased much of the corn he fed at \$1.00 a bushel. He is definitely opposed to price supports, feeling that you can't get something for nothing and that they will be ruinous in the long run. But when I asked him if the majority of his neighbors were of the same opinion, he shook his head ruefully and said he feared that the number would fall short of a majority. Bob Farr who grows potatoes and sugar beets and raises livestock at Greeley, Colorado, agreed with Watson as to the dangers of price supports and also felt that most of his neighbors would agree.

With few exceptions, the ranchers with whom we talked were unanimous in their dislike of price supports. In making this comment, it is important to remember that, by and large, we were talking with livestock growers rather than with men whose income comes from growing crops. It is encouraging, however, to tell you that many of the men reported that farmer sentiment against crop supports at high levels is growing.

The last day of the trip was spent on three family-size farms near Loui-

FARMERS STEP UP PROFITS WITH "ON THE FARM" STORAGE

Sturdy, strong, fire-safe Quonsets enable farmers to take advantage of Government Price Support Program

Want to store—and condition—ear corn? Want to store shelled corn, wheat, oats, soy beans, cottonseed—or any crop—in one building, and still have room for truck or implements? It can be done in the versatile Quonset. Study the illustration above—simple partitioning of a Quonset makes it right for storage of a variety of crops. Quonsets permit you to hold crops safely for peak prices. Quonsets meet all CCC requirements for crop storage at a low cost per bushel. Get all the facts on this great farm building today!

BIG SALE PAVILION

Earlville, Madison Co., N. Y.

Route 12-B; 40 miles south of Syracuse;
50 miles north of Binghamton;
25 miles south of Utica.

320 REGISTERED HOLSTEIN CATTLE

Selling at public auction, and your price.

100 leading Holstein breeders of New York, New England and neighboring counties consign some of their best.

All TB Accredited—blood tested—nearly all calfhood vaccinated; those bred long enough examined for pregnancy.

125 Heifers—due in early fall—large and by leading production sires.

100 Open yearlings and senior heifer calves.

125 Fresh and Close Springers, majority first and second calf heifers.

45 Bulls—all of service age, and everyone is from a dam with large proven production record, up to over 800-lbs. of fat.

The 27th ANNUAL SPRINGTIME EARLVILLE SALE, and the 253rd in this, AMERICA'S OLDEST ESTABLISHED AUCTION OF REGISTERED HOLSTEINS.

You always get more for your money at Earlville—and this big sale gives you many to select from. It's the largest sale in the east this spring. Many will sell at just about grade cow and heifer prices. Ask those who have bought at Earlville.

BE SURE YOU ATTEND—COME BOTH DAYS, MAY 3 and 4

Trucks available. Sell your grades and replace with Registered Holsteins, in this big sale, where every animal is sold to be as represented.

BUY DIRECT FROM THE BREEDER—SAVE MONEY GET MORE—come to this sale. Sale starts each morning at 10 A.M.—hot dinner at noon.

For more details, write the Sales Manager and Auctioneer.

R. AUSTIN BACKUS, who founded this sale 27 years ago.
BOX E, MEXICO, N. Y.

By J. F. "Doc" ROBERTS

DHAVE just returned from Farm and Home Week at Cornell University, Ithaca, N. Y. I feel better; I did not find my friends overly pessimistic or the experts overly alarmed about our national or international situation. Here are some of the things I heard:

The loose dollar has disappeared; but the backlog of money is greater than ever before and is held more tightly. Farmers have already taken about a 25% break in prices and it is not likely that they will take another 25% break. Expenses of farmers are also not likely to get much lower and neither will farmers be able to cut their own costs much without lower production or at the expense of the future, the future of their equipment, animals and land.

Food surpluses have been over emphasized. If the people had eaten as much meat in 1949 as they did in 1947 it would have taken all the grain surplus we now have to have fed those animals. If we had eaten 1 dozen more eggs per person in 1949, there would be no egg surplus now. With the exception of grain, most of the food surplus which we now have will, or already has, spoiled and will never get back into food channels.

Labor Costs

Labor costs are not likely to break much. In fact, labor efficiency has increased almost exactly at the same rate as their pay. For example, where labor is producing about twice as much per man through machines, efficiency, etc., his pay has also about doubled. This would have happened regardless of unions, or labor leaders who are thumping their chests and saying, "See what we did!"

Unemployment is also producing greater efficiency and effort with greater production from the men that are working. They want to hold their jobs and they prize them. Unemployment, I am told, is not excessive with four or five million men out of work. That sounds pretty tough to me, but I expect that it is right, especially when they say there are about two million who won't or can't work.

Government subsidies with controls are with us to stay. The amount of subsidies varies with the attitudes of the people from year to year or from election to election, the controls vary with the activities of farm groups, and farmers themselves are trying to keep bureaucracy off their necks. There was a warning that, after all, we do elect our lawmakers and they are very susceptible to propaganda that might be harmful or beneficial to farmers. Therefore, farmers must be ever alert so that their position cannot be misinterpreted. This is especially true now because it was brought out that today about 10% of the people (farmers producing for sale) are producing about 90% of all our food.

More Figuring

The young farmer was told that his father and grandfather had to figure out as best they could whether to produce more or less milk, more or less potatoes or cabbage; hire more or less labor, etc., in any given year, depending upon how they evaluated national conditions and many other considerations. Now, not only all of the same situations and conditions have to be figured out but also what the government may or may not do. This can prove to be and is already the greatest

RAISING PULLETS FOR NEXT FALL'S LAYERS

(Continued from Page 16)

much space for this discussion so we will just say that the successful poultryman has a definite disease prevention program which he follows to the letter.

If it should so happen that you hatch your own chicks you will plan to set five eggs for each pullet that you will need. If you buy straight-run chicks you will buy about three for each pullet you will want next fall. You can, of course, buy sexed pullets and your decision on sexed versus straight-run chicks will depend on the situation on your farm.

The Final Result

Always, certain pullets develop more rapidly than others. If you are keeping Leghorns you can expect your first eggs around the age of five months or a little less. If you are raising heavies it may be close to six months. In the past, there has been a lot of discussion on two points. First, whether or not the slow-maturing pullets are worth keeping; second, whether or not a poultryman should hold back his pullets in an attempt to prevent laying before they are fully developed. Most poultrymen agree that the early-maturing pullets should be separated from the rest in the fall and put into the laying house, but that the slower maturing pullets will then develop and most of them will make profitable producers.

On the second point, the general idea at present is that there is no object in attempting to slow down the development of the pullet. In general, heredity will determine the age at which she will lay and the point to stress is to give her the feed and growing conditions which will develop her into a full-sized pullet at laying age.

To a poultryman who, for some years, has gone through the annual strain of raising a profitable flock of pullets, it is little wonder that the amateur who "barges" into poultry raising without experience generally ends in disaster. Poultry-keeping is a strenuous, demanding occupation; but the real poultryman would be satisfied with no other business.

Editor's Note: What short cuts or money savers have you developed in raising pullets? For the best 600-word letter on the subject we will pay \$5.00. For all others published we will send a check for \$2.00.

— A. A. —

FEEDING SPACE FOR CHICKS

WITH all that is said about providing floor space for growing chicks, and the disadvantages of crowding, it is not always recognized that insufficient feeding space likewise is dangerous, and often some harm is done before the operator realizes that more space should have been provided. The needs of the chicks increase very rapidly during the first few weeks, and additional hopper space as well as more house room must be supplied. There should be no piling up and wild scrambles at the feeders, or waiting for "second table" if healthy, vigorous birds are to be grown.

For the first few days, new cup flats, laid on the floor make very satisfactory feeders. Some poultrymen use newspapers, turned daily, with good results for the first three or four days. Supply feed sparingly, in quantity so that it will not be scratched off into the floor litter. Later, shallow boxes or feeders with wire guards or reels are advised to prevent chicks getting into or fouling the feed and to prevent chicks picking or scratching feed out of the hopper. After chicks are several weeks old, still larger boxes or troughs, four or five inches deep, will hold feed sufficient to cut down labor in feeding. Wire-

(Continued on Page 21)

THE START THAT MAKES

Better Pullets

As the chick starts, so grows the future layer. The body, frame and internal organs that good layers need begin to develop at once . . . or not at all.

Yes, the pattern is molded in the brief Starting Mash feeding period . . . sometimes even in the first few days. No wonder, then, that Pratt's "Double-Duty" Chick Starter is such an indispensable feed.

Built solely for future layers, Pratt's "Double-Duty" Chick Starter vitally nourishes the chick for egg production from the first day. It abounds in vitamins, minerals and other critical nutrients to feed all the chick . . . not just its frame and body. The foundation that makes better-laying pullets is unerringly laid.

So nutritious is Pratt's "Double-Duty" Chick Starter that it's more than the finest Starter science knows how to build . . . it's a corrective feed as well. Many chicks have the first symptoms of some nutritional deficiency the day they're hatched. Too

often, just a good starter is not enough to head off this threatening trouble.

Pratt's "Double-Duty" Chick Starter is purposely made so rich in all critical nutrients that the first few ounces can and do head off many troubles that begin in the egg. For Pratt's will overcome many cases of Curled Toe . . . Rickets . . . Hock Disease and other deficiencies that begin in the egg.

So this year feed Pratt's "Double-Duty" Chick Starter. Give weak chicks another chance to gain strength and health. And give all chicks the start that makes better-laying pullets.

Ask your dealer for Pratt's "Double-Duty" Chick Starter today. When you see your egg checks next fall, you'll know it paid!

FREE! "Their Life Is In Your Hands," the new edition of Pratt's booklet of practical chick-raising help. Write Pratt Food Company, Dept. BC-22, Philadelphia 6, Pa.

Green Grass To Red Meat

(Continued from page 17)

siana, Missouri. Except that these farmers raised beef cattle, hogs and sheep, one might have shut his eyes and imagined he was on a northeastern farm. These three men were very definite in their belief that price supports should be tapered off and eventually abandoned. No one proposed that price supports be discontinued all at once, and a considerable majority admitted that a floor price at a low level—perhaps 60% of parity—had considerable merit.

Trucks Brought Changes

Equipment has brought great changes to Western farming. At present around 78% of the animals coming into the Chicago stockyards are brought there by trucks to lessen the time and shrinkage between farm and market.

Animals can quickly be trucked to pasture. In the old days a herder's sheep might die for lack of feed and water while 100 miles away there might be abundant feed. Now they can be loaded on trucks, taken to the feed, and when the feed is gone they can be moved to another spot. Again, contrary to my preconceived idea, there is often excellent pasture for short periods on the desert. When a rain does come, the vegetation shoots up with amazing rapidity, but unless it is grazed it dies down in a few weeks when the moisture is gone.

More and more the open range is being fenced. The entire Fernandez range of 300,000 acres with its 3,000 beef cows and 10,000 sheep, is fenced with 4-strand barbed wire. Mr. Lee told me that the cost of this fence could be written off in 15 years, and it is his opinion that complete fencing of all ranches is inevitable.

Along with more fences, greater and greater attention is being given to adequate water supplies. In general, these are of two kinds: the ponds in dammed streams kept deep and with a small surface area to minimize surface evaporation, and driven wells, most of which are operated by windmills.

A Meat Factory

At Betteravia in California we visited a mechanized feed lot. On the average 100 beef animals are marketed from this feed lot every day. Ordinarily steers, some bought and some fed on contract, are fattened in the feed lots for about 3 months. Strangely enough, the usual gain in weight does not give a profit but a better price is assured. For examples, steers might be bought for 26c a pound, fed 90 days, and sold for 29c a pound.

At this feed lot, one of the largest in the West, about 60 tons of alfalfa, 40 tons of barley and equivalent amounts of beet pulp and molasses are fed each day. Some of these steers will gain as much as 2½ pounds a day. The beet pulp comes from an adjoining sugar factory. As the factory does not run the year round, pit silos are provided to hold 100,000 tons of wet beet pulp silage. A power shovel is used to take out the silage.

Throughout the feed lots there are three miles of narrow gauge track and small cars hauled by a gasoline-operated power unit distribute feed to bunkers. Each steer gets around 8 pounds of barley, 6 pounds of hay, 4 of molasses, 1 of cotton seed meal and 1/10 of a pound of bone meal per day. When they are bought from range they weigh from 700 to 800 pounds and they may weigh up to 1,000 pounds when sold. No one calls this a farm or a ranch. In effect, it is a meat factory.

A Family Ranch

Among the ranches we visited, the one nearest to a family farm was owned

by Ted Chamberlain near Los Olivos, California. Mr. and Mrs. Chamberlain have six children and the four middle ones, two boys and two girls, all have 4-H beef steers. The entire family helps and only three men are hired to handle 100 beef cows and the resulting calves which are kept until they are two years old. In addition, steers are bought and fattened. Mr. Chamberlain has some land which has been leveled and which is irrigated from wells. Electric pumps work day and night, storing water in ponds. Mr. Chamberlain said that to level the ground and supply the water might cost him as much as \$500 an acre.

Many Acres Per Steer

The amount of land required for an animal in the West varies according to the rainfall. In California on irrigated pasture, the carrying capacity will equal or exceed the capacity of the best pastures here in the East. But in Utah, Mr. Kippen was grazing 2,500 ewes for six months on 20 sections of government land totalling 12,800 acres. If you had the chance to see the ground they were grazing you would wonder how they could live even at that.

In New Mexico we were told that according to a rough rule of thumb you could pasture one steer per section of 640 acres for every inch of rainfall that fell during the year. For example, if you are lucky enough to have a 16-inch rainfall, you could pasture sixteen animals on 640 acres, or one steer for every 40 acres. We were told that the minimum sized ranch for efficient operation was two townships totalling 72 square miles, and that while many ranches were smaller, a ranch should have at least 300 cattle to make a good living.

Wherever we went the impression was gained that livestock owners consider their type of farming or ranching as sound. Several times we heard reference to Ed Babcock's proposed plan for an ever-normal refrigerator. In general, livestock men are conservative, perhaps because the time required for the natural reproduction of animals cannot be shortened. As a group they distinctly are not "plungers." They are gamblers because they must be. They never know when a calf or lamb is born what the price will be when the animal is ready for market. But as J. J. Lane of Roswell, New Mexico, told me, "I have seen meat prices drop rapidly to a ruinous level, but even at my age I would rather go through that again than to see the farmers of this country depend on government 'hand-outs.'"

Among the livestock men there is unanimous belief that this country needs more meat. They point out that costs of production have risen drastically just as they have for all farmers. They are anxious and willing to raise livestock, but they can't do it unless their operations show a profit. Most of them agree with the viewpoint of Northeastern farmers that it is far better to let animals eat grain than it is to take it off the market under a government price support program.

Our trip, which was directed by Colonel Ed Wentworth of the Armour Livestock Bureau, assisted by Tony Alic of the Armour Company, and "Chuck" Middlestat of the advertising agency that handles the Armour ads, was exceedingly well organized and conducted. The hospitality of our Western friends who met us at every stop and their unflagging zeal in answering our questions exceeded everything that we had heard about the West. I returned with the opinion, which I think was shared by my fellow travelers, that the housewife is the one who sets the price of meat.

Danger of Disease

Among Baby Chicks

Success in raising Baby Chicks depends largely upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby Chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your flock before you are aware. Use preventive methods—use Walko Tablets. For over forty years thousands of poultry raisers have depended upon them. You, too, can rely on Walko Tablets as a valuable antiseptic to aid in preventing the spread of disease through contaminated drinking water.

Remarkable Results Raising Baby Chicks

Mrs. C. M. Bradshaw, Diagonal, Iowa, writes: "I have been using Walko Tablets for 35 years with splendid results. I would not think of trying to raise Baby Chicks without them. I also use them for my grown birds with the same satisfaction."

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

NO NEED TO WEAR A TRUSS FOR RUPTURE

**That Binds, Cuts, Gouges,
Slips and Does Not Hold**

If you must wear a Truss for Rupture, don't miss this. A Post Card, with name and address, is all you send to W. S. Rice, Inc., Dept. 65-H 13, Adams, N. Y. to get FREE, and without obligation, the complete, modernized Rice Plan of Reducible Rupture Control. Now in daily use by thousands who say they never dreamed possible such secure, dependable and comfortable rupture protection. Safely blocks rupture opening, prevents escape, without need for bulky, cumbersome Trusses, tormenting springs or harsh, gouging pad pressure. Regardless of how long ruptured, size, occupation, or trusses you have worn. TRY THIS, and send your Post Card today.

BABCOCK'S Healthy Chicks MAKE GREAT LAYERS

year ('48-'49) our White Leghorns won as follows at the official egg laying tests: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird) for high average production all breeders in U. S. competing. This is highest average ever made. 6. We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND
We hatch White Leghorns, Red-Rock Cross, Rhode Island Reds, and Barred Rocks all year... own two hatcheries, with 530,000 egg capacity—three poultry farms and 15,000 breeders. We also carry on a complete pedigree-progeny testing program.

RICHQUALITY CHICKS ARE MONEY MAKERS

We produce chicks for commercial poultrymen who are interested in birds that live and produce lots of big eggs. We have been improving our strain of White Leghorns for 33 years.

OUR chicks are as disease-free as modern science knows how to make them. Here are some of the reasons why: (1) We produce all of our own eggs on our own farms. (2) Our flocks are proved "Pullorum Clean." (3) All stock is vaccinated against Newcastle.

VISIT our hatchery in Hobart, N. Y., or write for new free catalog.

WALLACE H. RICH AND SON
BOX 10-A HOBART, N. Y.

STARTED CAPONS

COST far less than turkey poult, are easier to raise, bring premium prices all year 'round and are preferred by many over turkeys. The demand for CAPONS exceeds the supply.

When you're looking for greater profits in poultry—turn to CAPONS. We sell mail order only. Our chicks are blood tested—SURGICALLY CAPONIZED and taken thru the most tedious period for you. They grow large, fast and heavy. Information on growing and fattening CAPONS sent with each order. For further details and prices, write to

SHRAWDER'S ANCONA FARM, RICHFIELD 10, PA.

(Continued from Page 19)

covered stands or platforms are very desirable when coccidiosis is likely to be a problem, since the spilled and wasted feed, contaminated by droppings, falls through the wire and is out of reach of the chicks.

While it probably is a good thing to permit mash boxes to go empty for brief periods now and then, feed should be replenished frequently enough so that chicks do not, for want of something better to do, develop vicious habits. Doubtless many chicks found to be eating litter have been driven to it because they could not get at the feed boxes. Weaker chicks are crowded or driven away by the stronger ones. The nagging and fighting thus developed are one cause of cannibalism, which may persist after the cause is corrected.

—D. H. Horton

—A.A.—

HINTS ON RANGE SHELTERS

A RANGE shelter can be an asset on the poultry farm provided it is correctly constructed and properly used. This is more true today with the coming of the permanent brooder house than in the past when colony houses were the fashion.

Type of soil on the farm is the greatest factor in determining the size of the shelter. That is, very light soil cannot support too heavy a concentration of birds without becoming bare. On the other hand very heavy soil can support many more birds without showing severe wear and tear. With soil type in mind, selection of a 6 x 8 or 6 x 10 shelter may be judged as the correct size for light soil, and 8 x 10, or 10 x 10 or larger as ideal for heavier soils.

Consideration needs to be given to height of the shelter, since to a degree this will determine its wind resistance. This is especially true where the shelters are to be winterized for early spring brooding and where spring winds can be damaging. It seems desirable in this case to set a maximum height of 5 feet.

Of course, range shelters ought to be as cool as possible during the summer months. This may be attained by the use of aluminum roofing which is one of the best heat deflectors. In addition to keeping the shelter cool, it also makes a durable, long lasting roofing material.—H. W. Hickish.

—A.A.—

CROWDED CHICKS

When chicks crowd at night, it is usually the result of chilling, overheating or drafts. Drafts can be avoided the first few days by putting a guard of roofing paper around the hover. So far as chilling and overheating are concerned, the best measure is the actions of the chicks. If they are too hot, they will go into the far corners of the house. If they are too cold, they will huddle under the hover and begin crowding.

Sometimes putting a 10-watt bulb over the hover tends to lessen the crowding.

—A.A.—

KEEP OLD AND YOUNG POULTRY SEPARATED

An important point in raising healthy pullets is to keep the old stock and the young stock separated. In some cases, where the farm does not lend itself to this arrangement, a small poultryman will decide that it is to his advantage to buy started or ready-to-lay pullets.

The dangers of raising young and old birds next to each other is that some diseases which the old birds have but do not show are easily transmitted to the chicks.

—A.A.—

When burning winter trash be sure to lay the fire in an open space on bare ground so that trees and shrubs will not be scorched by the heat.

CLEMENTS BROS. FARMS CHICKS

LESS MILK FOR CALVES

According to the U. S. Department of Agriculture, dairy calves can be raised successfully from birth without receiving any whole milk and with a limited amount of skim milk provided it is supplemented with cod liver oil. From nearly 20 years' work, Henry Converse of the U. S. Department of Dairy Industry at Beltsville, Maryland, has concluded that calves are often fed more milk than they actually need for proper development. At Beltsville the calves made satisfactory gains when fed no whole milk and only 280 to 460 pounds of skim milk. This is in comparison with some recommendations to use 550 pounds of whole milk and up to 2,900 pounds of skim milk per calf.

Monthly records of weights and heights were kept at Beltsville. Records indicate that calves are somewhat under normal weight up to 6 months of age, but most of them reached normal weight before they were 12 months old.

DOWN THE ALLEY

(Continued from Page 18)

consideration of all for the farmer now must figure how to stay within the law and still derive a satisfactory income from his farm, while following rules laid down by politicians who in turn are following pressures from 80% of the people who now are not interested in farming as a livelihood.

So to summarize, nothing is really new; the old scramble goes on in much the same way it always has. New rules, new money values, new ideas in government and new farm practices are all subject to the old fundamental principles of God, family, friends, work, play and the character we develop for ourselves.

P. S. I also heard this:

"When I work, I work easy.
When I sit, I sit loose.
When I worry, I sleep."

And This!

ODD SIZE tires and tubes. Robert Chase, Earlville, New York.

placed in the Congressional Record by Representative Hill (R., Color.):

IDEALISM—If you have two cows, you milk them both, use all the milk you need and have enough left for everyone else.

SOCIALISM—If you have two cows, you keep one and give the other to your neighbor.

COMMUNISM — If you have two cows, you give both of them to the Government; then the Government gives you back some milk.

SOFA-PINK COMMUNISM—If you have two cows, you keep the cows but give all the milk to the Government.

IMPERIALISM — If you have two cows, you steal somebody's bull.

CAPITALISM — If you have two cows, you sell one cow and buy a bull.

NEW-IDEALISM—If you have two cows, the Government shoots one cow; you milk the other, then throw part of the milk down the sink.

ANARCHISM — If you have two cows, your neighbor shoots one and takes the other.

NAZISM—If you have two cows, the Government shoots you and takes both the cows.

REALISM—If you have two cows, they're both dry.—Contributed by Bill Dunn—Schoharie, N. Y.

— A. A. —

HIG COW STALLS

There is no doubt that small stalls are an important factor in the spread of mastitis. They make conditions favorable for udder injuries from sharp gutter edges and from the feet of cows in adjoining stalls.

The usual recommendation these days is for a platform which varies in length from 4'6" at one end to 5'2" at the other. In other words, the gutter is not parallel to the manger so that the platform varies in length to make provision for cows of different size.

To figure a suitable width for stalls, make stalls eight-tenths as wide as they are long.

Afford to

Gamble? ²/₆₀

BALANCE SHEET

Breeding 10 Cows Artificially	up to \$60.00
Net Cost If 5 Are Heifers	each \$12.00
400 Extra Lbs. \$3.00 Milk	\$12.00

If each heifer lives to milk three lactations, that's less than 1/2 lb. of milk a day she has to be better than her mother, or her sister by a scrub bull. And there's no expense of keeping a bull. Who can afford to gamble?

For more information about your breed and service in New York and Western Vermont, write

5 doctors prove
this plan breaks the
laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

Remodeled KITCHEN

BY JOAN MILLER

BEFORE

AFTER

MRS. MYERS' U-shaped kitchen has all the equipment in the order that she uses it. The traffic lane is planned so people can walk through the kitchen without walking through the work center. This room gets plenty of air with three windows opposite the window over sink; and there's a ventilating fan over the stove.

For everyday meals, the family gathers around the big table on the other side of the room (see "After" drawing). Its position in front of the three windows makes it a pleasant, airy place to eat and a convenient arrangement for serving meals.

HERE is the room for relaxing, just off the kitchen and next to the utility room. Mr. Myers stretches out on the glider at noon to read mail and hear radio market reports. Mrs. Myers keeps her basket of sewing on the floor by the chair where she does work and watch activities outdoors. The linoleum-covered ledge was put in to hold houseplants.

THIS UTILITY ROOM is equipped for several uses. Mrs. Myers likes to do the family washing here on the main floor instead of in the basement; then she just steps out the back door—and there are the clothes lines! Door at left leads to a shower room, a handy clean-up spot for the menfolks.

(Left to right): C. C. DuMond, Commissioner of Agriculture & Markets, New York State Department of Agriculture; Warren Hawley, Batavia, president of the New York State Farm Bureau Federation; Allan Kline, Iowa farmer, president of the American Farm Bureau Federation; W. I. Myers, Dean of the New York State College of Agriculture.

Here's the Best from Cornell's Farm and Home Week

ALLAN KLINE, president, American Farm Bureau Federation: "The soundest and most hopeful solution to farm problems is the diversion of more production from the farms to promote better human diets.

"We need a national independent bipartisan commission set up to study public fiscal and monetary policies. Such a committee should report to Congress which could do much to iron out economic fluctuations with a minimum control of individual farms or firms.

"This country's spectacular success to date has been based on a system of individual freedoms. Under this system the American consumer can get more and better food in return for an hour of labor than most anywhere else in the world. We can do even better provided we are not lured into the sacrifices of our incentive system by illusory promises of government guaranteed security."

W. I. MYERS, Dean of the College of Agriculture: "In 1950, as in other years, our greatest opportunity for improvement and well-being lies in further increasing output per worker in Agriculture and other parts of the economy. We may get tired of hearing the word 'efficiency' but it would be well for all of us if we would listen.

"Surpluses are being overemphasized; a drought could easily change the picture. Our increased food supply has been used to feed more people better. As the population continues to climb during the 50's we must still have higher production to maintain our food standards, otherwise we must import more or eat a less desirable diet.

"My guess for 1950 is for a reasonably stable, general price level. New York prices as a group will average around present levels. Whatever happens, New York farm prices will continue to follow the trend of the general price level by fluctuating around it, depending on the demand and supply of food."

L. C. CUNNINGHAM, Department of Agricultural Economics at Cornell: "The farm price of milk in New York State is likely to drop around 12% below the 1949 price which would be a decline of 29% below the peak year of 1948. As a group, costs are expected to continue to decline more slowly than the price of milk. In the future, dairy-men are likely to shift their emphasis more and more to making milk on hay and pasture."

V. B. HART, Department of Agricultural Economics at Cornell: "The family-size farm is here for at least another 50 years. The average commercial farm will be a bigger business, but

still a two-man business. Magazines are still printing articles on corporation farms and congressmen will introduce bills aimed at preserving the family-size farm. If left alone it will probably preserve itself.

"Opportunities will increase for a reliable young man to get started toward farmer ownership by working in partnership basis with older men."

C. A. BRATTON, Cornell Department of Agricultural Economics: "Selecting a farm is one of the most important decisions in a young man's life. Study the area where the desired type of farming is practiced; make use of soil maps and land class maps, and consider size of farm, productivity of soil, size and condition of buildings, farm layout, water supply, the community, conveniences available, market outlets, and overall productive capacity of farm.

"Set high standards. Look the field over. Don't be hasty. You can't have everything, but get the most you can when selecting the farm on which you expect to spend your life."

FRED E. WINCH, Cornell University Forestry Department: "Farmers should remember that woodlots bring the highest return when sawlogs are cut, but unless the cordwood is removed and the woodlot thinned then sawlogs just can't develop.

"A power saw is no longer a novelty and its cost is now within the range of most woodland owners. The two- and one-man saws may be used for felling and bucking the trees."

WILLIAM LANDAUER, breeder of Aberdeen Angus, Red Hook, N. Y.: "Farmers selling purebred cattle should stress good promotion, service, ethics, and pricing. Goodwill is essential in this business, and the best way to get it is to remember the other fellow. Don't forget your customers. Call them up a year or so after a sale, or ask about the heifer the next time you see them."

RAY BENDER, Essex County, New York Agricultural Agent: "One of the best pasture crops during the dry summer period when other crops aren't doing much is birdsfoot trefoil. It makes an ideal hay mixture when combined with smooth brome grass.

"In seeding birdsfoot, prepare a good seed bed, lime if necessary, and add superphosphate. Use 4 or 5 pounds of inoculated seed per acre. Never use clover of any kind with birdsfoot trefoil and avoid use of manure since it contains weeds and clover seed."

O. C. FRENCH, Department of Agricultural Engineering at Cornell: "The best method we know of to produce highest quality roughage is by making hay crop silage when field curing of

hay is difficult. Also, have a barn drier to finish cured hay when the weather is not good, and when weather permits, harvest field cured hay.

"Equipment on New York farms has been increasing. In the last 4 years the number of tractors has increased by 45%."

A. R. BLANCHARD, County Agent, Tioga County, New York: "If the farmer is ever going to be in a position where he can stand on his own feet and let the law of supply and demand operate freely, he must become reasonably self-reliant and produce more of his own food on his own farm. We cannot become completely self-sufficient, as farmers were 100 years ago, because we have roads to maintain, schools to support, electricity and telephone service to pay for. These things in themselves mean that the farmer must produce some farm products for sale. However, I do not think that he should depend upon them entirely for his livelihood."

From the Farm Woman's Viewpoint

MARY PURCHASE, State College of Home Economics: "Hard water contains minerals which react with soap to form an insoluble, gray curd. This sticky curd makes the removal of dirt difficult. The answer to this problem is to use synthetic detergents which do not react with the minerals in hard water or to use a water softener which dissolves soap curd. Dirty water left in clothes will affect their color and brightness. Another rinse, a second run through the wringer, or longer spin in the dryer may help to remove dirt.

"Hot water, up to 190 degrees F., makes clothes whiter. Since water at 180 degrees F., however, is hotter than most homes have, temperatures ranging from 150 to 160 degrees F. are acceptable. Excessive bluing should be avoided since it only makes gray tinged clothes grayer."

REV. HERBERT LOOMIS, West Winfield, N. Y.: "Here are 7 needs which a church program should meet: (1) Every person needs to have Communion with God; (2) to grow in Christian understanding; (3) to dedicate his life; (4) every church needs a sense of community responsibility; (5) every person needs fellowship; (6) world vision; and (7) to dedicate his substance."

MRS. ESTHER BRATTON, State College of Home Economics: "If you expect housework to keep your figure streamlined, maintain a good posture as you work. Long hours over sinks and counters that are too low or too high can add bulges in the wrong places."

MRS. LUCILLE WILLIAMSON, State College of Home Economics: "Before you buy an automatic washing machine you should get satisfactory answers to

1950 CHAMP SHEEP SHEARER. Jack Dibble of Branchport, Yates County, N. Y., winner of the New York State Sheep Shearing Contest. His average time for 3 sheep was 3 minutes and 33 seconds. Second place went to Don Mackenzie, Geneva, Ontario County; and the names of the 3 other contestants in order of placing are as follows: Alfred Howell, Rock Stream, Schuyler County; Cecil Smith, Whitesville, Allegany County; Stanley van Vleet, Lodi, Seneca County.

the following questions: (1) Do you have a large enough hot water supply? (2) Does the water pressure vary? Some machines have a timing device which governs their filling. If the pressure is low, the cylinder may not fill enough. Other machines cut off when the water reaches a given level. (3) Will the floor stand the vibration of the running machine? (4) Is there an experienced serviceman nearby who can take care of necessary adjustments?"

ROYDEN C. BRAITHWAITE, State College of Home Economics: "The crisis of our age is a crisis in spiritual values as many competent spokesmen of the day have testified. If man is to survive, he must truly understand the meaning of democracy, of the right to dignity and individual worth; and he must do more than give lip service to the words."

MISS ELIZABETH VOLLMER, 4-H Club Extension Food Specialist: "Recent work on meringues indicates that the best meringue pie toppings result from: (1) placing the meringue on warm filling to reduce leakage and beading; (2) spreading the meringue to the edge of the crust to prevent shrinkage; (3) baking at 425 degrees F. for four to four-and-a-half minutes to give a tender, less sticky meringue."

Rochester Home Bureau members at Cornell's Farm and Home Week find some things the rest of their families would like at an exhibit on Creative Fun for the Family. Both the wagon and the doll can be made in the family workshop, specialists told Mrs. Matt Thomson, 91 High Terrace, who is chairman of Unit 16; Mrs. Bert Goodwin, 1550 Elmwood Avenue, who teaches crafts; and Mrs. James McCracken, 37 Wilton Terrace.

"NO MORE SLEEPLESS NIGHTS"

"I feel so much better since I no longer have to dread those awful sleepless nights! My 'insomnia' turned out to be due to caffeine in the coffee I drank. So I switched to POSTUM and now I get 8 hours of restful sleep every night."

Are sleepless nights, due to "coffee nerves", interfering with your good health?... Do you wake up in the morning, feeling tired and logy?... Then, try a switch to 100% caffeine-free POSTUM. See if you don't enjoy good, natural sleep that makes you feel better and enjoy life more.

SCIENTIFIC FACTS: Both coffee and tea contain caffeine. And caffeine is a drug that acts upon the brain and central nervous system. Also—in susceptible persons—caffeine tends to produce harmful stomach acidity. So, while many people can drink coffee or tea without ill-effect, others suffer nervousness, indigestion, sleeplessness. But POSTUM contains no caffeine or other drug—nothing that can possibly keep you awake!

MAKE THIS TEST: Give up coffee—give up tea—drink POSTUM exclusively for 30 days—and judge by results! Ask your grocer today for INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran—100% caffeine-free! POSTUM is a Product of General Foods.

Early Spring Preserving

By GRACE WATKINS HUCKETT

FRESH asparagus is a delicacy when served on the table. Unfortunately, it is difficult to can or freeze it so that it approaches the flavor and texture of the absolutely fresh product. However by observing certain rules, it can be done to a certain extent.

First of all, the choicer asparagus is obtained during the earlier part of the season; then quick handling from the time of picking to the time of canning or freezing is absolutely necessary since this vegetable deteriorates rapidly. Grading all stalks according to size makes for a better product.

TO CAN ASPARAGUS

After grading, removing the scales, and washing the asparagus carefully, tie stalks of similar size into bundles. Stand them in boiling water and boil lower $\frac{2}{3}$ of stalk for 3 minutes; tip bundles over and boil for $\frac{1}{2}$ minute. Pack, add salt, $\frac{1}{2}$ teaspoon per pint, and cover with boiling liquid, or cut stalks into short pieces and boil for 3 minutes. Pack them hot and cover with boiling liquid to within $\frac{1}{2}$ inch of top of jar. Partially seal and process pints at 10 pounds pressure for 25 minutes, quarts for 35 minutes. Remove from heat, let pressure return to zero, remove jars from cooker, complete seal if necessary, and cool—out of draft—with jars separate to allow free circu-

lation of air. Label and store in a cool, dark place.

TO FREEZE ASPARAGUS

Trim the graded asparagus to 5-inch lengths, since the upper 5 or 6 inches of the stalk is all that is free of woody fiber. Discard any stalks over one inch in diameter. Segments of the next $1\frac{1}{2}$ inches may be blanched and frozen to be used in soups. Wash thoroughly. In a basket or cheesecloth, immerse the stalks up to $\frac{3}{4}$ inch in diameter in boiling water for 3 minutes or in steam for $3\frac{1}{2}$ minutes, one minute longer for larger size. Cool immediately in very cold running water, leaving them in the water just long enough to cool. Drain and pack the stalks in the carton with heads in alternate directions.

For small quantities, use either waxed square-cornered cartons lined with moisture-vapor-proof paper or round cartons of the proper height. For large quantities, place the asparagus on a sheet of cellophane or moisture-vapor-proof paper with the heads in alternate directions. Then fold the sides of the paper toward the center over the asparagus, roll it up and seal. Then protect this roll with an outer sheet of locker paper or stockinette. Freeze asparagus promptly and store.

Rhubarb is another of the early spring treats. Fortunately, it lends itself well to preservation either by freezing or canning.

TO CAN RHUBARB

Cut the tender washed unpeeled rhubarb in $\frac{1}{2}$ - to 1-inch pieces. Pack tightly and cover with boiling thick sirup (1 cup sugar to 1 cup liquid) to within $\frac{1}{2}$ inch of top of jar. Just cover and process 20 minutes in boiling water bath for either pints or quarts, or add $\frac{1}{4}$ cup sugar for each cup rhubarb and cook on top of the stove or bake in the oven until rhubarb is somewhat tender. Pack hot into the jars, adjust covers, and process 5 minutes in boiling water bath after water resumes boiling. Remove from hot water bath, complete seal if necessary, cool, label and store in a cool, dark place.

TO FREEZE RHUBARB

The early Spring rhubarb is best for freezing. It may be scalded and frozen like a vegetable or like a fruit, covered with sugar sirup or frozen without sugar. By the former method the one-inch lengths of rhubarb stalks are scalded in boiling water for $1\frac{1}{2}$ minutes, cooled, packaged, and frozen.

Another method is to cover the scalded rhubarb with a 65% sirup ($6\frac{3}{4}$ cups sugar boiled with 4 cups water). Still another way is to cook the rhubarb until tender in a 65% sirup, lift the pieces from the sirup into the box and cover with sirup.

Still another and often-used method is to pack the pieces without scalding and without sirup. The specialists at the Georgia Experiment Station rate as excellent the frozen rhubarb which was packed without any previous treatment, in sugar 4 or 5 parts by weight of rhubarb to one part by weight of sugar (one cup sugar to 5 or 6 cups rhubarb). They rate this method as preferable to that of pre-steaming the rhubarb.

Still another favorite way of some families is to freeze the rhubarb sauce. Cook it on top of the stove, or bake it according to your favorite recipe; cool it and pack in cartons or glass freezer jars and freeze. In cartons leave one inch headspace; in the glass jars, $1\frac{1}{2}$ inches headspace. If desired for combining later with other fruits or ber-

New Brunswick Grange Member Wins County Fair Cooking Prize

Mrs. Dominika Serick of New Brunswick, New Jersey, is one of Middlesex County's foremost cooks—and she has the trophies to prove it. Winner of countless cooking prizes in the past 30 years, Mrs. Serick is a member of Coast Brunswick Grange #15 and at present is Chairman of the Home Economics Committee of Middlesex-Somerset Pomona Grange #13. Prize-winner Mrs. Serick says: "Like almost everything, learning to be a good cook takes experience. It also takes the very best ingredients. When you bake at home, you have to use a good, peppy yeast to get good results. I've been using Fleischmann's Yeast since I started cooking years ago and I'll never use any other. It's fast and lively and I know it won't ever let me down."

Yes—prize-winning cooks prefer Fleischmann's Yeast.

FOR MEN, WOMEN AND CHILDREN

A strong, form fitting, washable support. Back lacing adjustable. Snaps up in front. Adjustable leg strap. Soft, flat groin pad. No steel or leather bands. Unexcelled for comfort. Also for post-operation support. Give measure around the lowest part of the abdomen. Specify right or left side or double. We pay postage except on COD's.

PIPER HRADE CO.
308 E. 12th Dept. AA-45 Kansas City 6, Mo.

Versatility — Plus!

No. **3034**. It's the versatile jacket dress again—this time with its bare top to catch the sun or cover-up with the fitted waist-high jacket! Sizes 12-20; 36-42. Size 18, 5 yards 35-inch.

No. **3044**. The beloved shirtwaist takes on a new and flattering softness via the supple collar, bloused bodice and gracefully gathered skirt. Sizes 12-20; 36-40. Size 16, 3 3/8 yards 39-inch.

No. **2125**. Here is a cotton charmer, simply enchanting—that daintily hides behind its very own tea apron! Sizes 12-20; 36-44. Size 18, checked, 4 1/4 yards 35-inch fabric; plain, 5/8 yard

35-inch.

No. **2126**. Young daughter will be doubly proud of her scalloped dress with its matching apron—because it is just like mother's—and looks so pretty! Sizes 4-12. Size 8, checked, 2 5/8 yards 35-inch; plain, 1/2 yard 35-inch.

TO ORDER: Write name, address, pattern number and size clearly. Enclose 10 cents for each pattern wanted. Add 20 cents for our new Summer Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

CORTLAND PRESENTS 5TH DRAMA FESTIVAL

THE 5TH annual Drama Festival will be held at Cortland State Teachers College at Cortland, N. Y., April 20, 21 and 22. Plays will be presented at 8:15 each evening and at 2 p.m. Saturday. Other features of the festival will be a series of one-act plays, a workshop relative to radio and television, a discussion of Problems in the Theatre by Thomas Ratcliffe, costuming and other demonstrations and a fashion show. The banquet will be at 6 p.m. Saturday.

REMOVES STAINS

Textile scientists of the United States Department of Agriculture have found that powdered pepsin dissolves the protein in stains made by substances such as eggs, milk, ice cream, meat juices, gelatin, glue, certain medicines like argyrol; also perspiration and blood. The dry powdered pepsin is sold in most drug stores.

In using pepsin on stains, first make sure the stained fabric contains no soap or other alkali. Then dampen the stain with lukewarm water and sprinkle the pepsin powder over it. Let it stand half an hour for the pepsin to act, keeping the spot damp. Finally

sponge and rinse well with water. Another way to use it is to mix 2 teaspoons pepsin to one pint lukewarm water and sponge until the stain disappears. Rinse thoroughly afterward. It is obvious that this treatment can be used on washable materials only.

— A. A. —

EARLY SPRING PRESERVING

(Continued from Opposite Page)

ries for spreads, it is a good thing to pack the rhubarb without sugar.

RHUBARB JUICE

Cook until tender the stalks, using about one cup of water for each 5 pounds of rhubarb. Add more water if stalks are really tough. Strain through a jelly bag. Add sugar, 1/4 to 1/2 cup per quart of juice. Heat fresh-pressed juice with sugar in upper part of a double boiler large enough that it need not be filled over 3/4 full. Bring quickly to the pasteurizing temperature 170° F. (just simmering); pour into hot sterilized jars or bottles to overflowing; remove foam, seal immediately, with sterilized covers; lay on their sides in a boiler or large kettle filled with hot (170° F.) water for 5 minutes. Remove and cool. Store in cold place. The lovely pink color of the juice gradually disappears, but the flavor remains the same.

POUGHKEEPSIE, N. Y.

Qualifications of Voters at School Meetings in New York State

TUESDAY, May 2, is the date of the Annual Meetings of Common School Districts in New York State. Some annual meetings for central and union school districts are held the first Tuesday in May, but many are held the second Tuesday in July. Watch local papers for the date of the annual meeting in your district. Frequently questions arise relative to qualifications of voters at school meetings, so here are the requirements:

"All voters at school meetings in common, union school or central school districts must have these qualifications:

1. A citizen of the United States.
2. At least 21 years of age.
3. A resident within the district for a period of at least 30 days preceding the meeting.

Any person who possesses ALL of the above general qualifications and any ONE of the FOUR following SPECIAL qualifications is entitled to vote:

1. Owns, leases, hires or occupies under a contract to purchase, real property in such district liable to taxation for school purposes. (Lodgers or boarders are not entitled to vote. Under the first clause persons who hold a joint deed or joint lease may each vote.)
2. Is the parent of a child or children of school age who attended the district school in the district for a period of at least eight weeks during the year preceding. (Under this provision both father and mother may vote.)
3. Not being the parent, has permanently residing with him or her a child who attended the school for at least eight weeks during the preceding year. (Under this provision but one person may vote, namely, the head of the household.)
4. Owns any personal property assessed on the last preceding assessment roll of the town exceeding \$50 in value.

Qualified voters may vote on any question; it is not essential that a person be a taxpayer to vote on propositions for raising money. To be legal, propositions concerning expenditures of money must be voted by ballot or by recording the votes of all qualified voters.

Women possessing such required qualifications are entitled to vote.

Challenges

Any voter in a school district may challenge any person offering to vote. The person so challenged can not be sworn, nor asked any questions as to his qualifications as a voter, but the chairman of the meeting must require such person to make the following declaration:

"I do declare and affirm that I am, and have been for 30 days last past, an actual resident of this school district, and I am qualified to vote at this meeting."

If the person challenged makes such declaration, his vote must be received, but if such person refuses to make such declaration his vote must be rejected.

A person who makes a false declaration has committed a misdemeanor and is subject to fine. The Commissioner MAY set aside action taken when persons vote after making a false declaration.

Powers of Voters

Qualified voters at school meetings have many powers including: 1. Electing trustees. 2. Electing a treasurer and fixing amount of bond. 3. Adopting a budget and voting a tax upon the taxable property of the district. 4. Authorizing trustees to have school property insured. 5. Designating site for schoolhouse or for grounds for playgrounds. 6. Providing for conveyance of pupils to schools maintained in the district or to nearby school with which a contract has been made.

When you build a RILCO BARN we do half the work

Rilco rafters are ready to put up when you get them. You never touch a drill or a saw. Because we've cut 'em to fit exactly . . . drilled all the bolt holes at exactly the right places. All you do is swing 'em into position, and bolt 'em down. You can have all the framing done ready for roofing and sheathing in less than one working day!

Be sure you get genuine Rilco Rafters at your lumber dealer.

Send the coupon for all the information on these strong, glued-laminated wood rafters that give you more room in a modern, attractive building.

Revamping An Old Barn

(Continued from Page 6)

so high that you went up three or four steps to get into the stable while the cows scrambled up ramps. In the new barn we went to the other extreme so that even now, men and cows go down hill into the stable. Believe me: Digging a hole more than a hundred feet long and thirty odd feet wide and three feet deep in stiff clay without the help of a bull-dozer or power-shovel is no small chore. I know this because I helped with that big job.

A Gutter Cleaner

Eventually under the guidance of a good, old-fashioned carpenter who believed in heavy timber, our barn took shape as a building in the form of a cross, the main aisle being 105 feet long and the cross arms aggregating 87 feet. It was three stories tall and we drove in on the third floor. For unloading hay and for threshing and for getting feed to the cows, it proved exceedingly convenient, but we could never really make our stables fit that narrow width. It carries a slate roof laid (believe it or not) at a cost of \$3.00 per square for the slate delivered at our station and Abe Stilson laid them by contract, including building paper under them for \$1.20—a total of \$4.20. To duplicate that roof today would cost somewhere from \$20.00 to \$30.00 per square and there are 80 squares of roof and 23 tons of slate.

We made all sorts of plans but that limitation of 30 feet of width seemed to forbid any really satisfactory stable design. It was just one thing—a mechanical gutter cleaner which solved our problem. Using this, it was possible to narrow up the center alley so that we could have the width of feeding alley and length of cow-bed required. One August day last summer, we started in to make a clean sweep of everything in the stable including all the old cement work.

When we were through we had used 351 sacks of cement and 100 tons of crushed stone and washed sand. We feel that for a cow bed, five feet is about the proper length for the average large cow. Most of our stalls are four feet and six inches wide, separated from each

other by concrete curbs. This seems an almost wasteful width but it is not more than is needed for big cows. In our old stables we continually had trouble from cows treading on the teats of their neighbor but with the new dimensions we have forgotten these misfortunes.

The large attendance and the general interest displayed on this barn inspection tour is reassuring evidence that the farmer is fundamentally hopeful for the future. If the price structure will level off somewhere near what it is now, there will be a good deal of revamping barns in the years ahead.

— A. A. —

REASONS FOR RESOLUTIONS

The Pennsylvania Cooperative Potato Growers', Inc., recently went on record as opposed to the continued price support, in any form, of potatoes by the federal government. The organization opposes the adoption of the proposed marketing agreement. Here are the reasons for the resolution, as stated by the organization:

"1. The past and present support program has shown the danger of putting potato growers under complete subservience to the government.

"2. Past performance of the support program has shown that the surplus problem has become worse instead of better.

"3. The support program has caused unfavorable publicity toward the potato industry.

"4. The wasteful disposal of the resulting surplus of the support program has created consumer resistance in the use of potatoes.

"5. The Pennsylvania potato industry has constantly adjusted its production to consumer needs on a strictly voluntary basis; as is evidenced by a drop from 180,000 acres in 1940 to 103,000 acres in 1949.

"6. The records prove that the Pennsylvania Cooperative Potato Growers', Inc., is putting a better product in the hands of the consumer, more economically and equitably distributed, than is being done under the support program."

SLIM & SPUD

Competition

For MASTITIS

use the drug with
the broadest activity

AUREOMYCIN OINTMENT

Lederle

Cut milk losses from staphylococcal and streptococcal mastitis with aureomycin, famous as the antibiotic with the broadest activity in human and veterinary medicine.

VETERINARY AUREOMYCIN OINTMENT For Udder Infusion *Lederle* is rapidly becoming the chosen treatment for mastitis because of the high percentage of infected cows that are quickly returned to production of salable milk.

Try AUREOMYCIN OINTMENT—you will find it

- MORE EFFECTIVE THAN PENICILLIN
- FLOWS FREELY AND SPREADS RAPIDLY THROUGHOUT THE UDDER
- ACTIVE FOR MORE THAN 48 HOURS
- WILL NOT INTERFERE WITH REGULAR MILKING HOURS
- COMBINES SAFETY WITH EFFECTIVENESS—FOLLOW INSTRUCTIONS IN PACKAGE LITERATURE
- PACKAGED READY TO USE
- EASY TO USE, WITH SMALL ROLLED-IN INFUSION TIP
- REQUIRES NO SYRINGE OR MILK TUBE

For maximum efficiency in the use of AUREOMYCIN OINTMENT For Udder Infusion and best management practices and disease-control procedures for avoidance of reinfection, consult your veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

USE AUREOMYCIN OINTMENT ALSO FOR PREVENTION OF MASTITIC INFECTIONS

When obvious injuries to the udder or teat occur, it is advisable to apply this ointment locally to the wound and at the same time to infuse each quarter so affected with one full tube of Aureomycin Ointment as a preventive measure against mastitic infections.

Kernels, Screenings and Chaff

By H. E. BABCOCK

WHEN I was deeply in debt myself, I don't remember being especially worried. This was probably because I was using up all my time and energy trying to meet my obligations.

Now that I am associated with young people who are trying without any outside incomes to buy and pay for farms, I find myself worried by their problems.

It is in this mood that I am returning to the Inlet Valley in New York State after a busy and quite delightful winter in South Florida.

I think what bothers me most is that I may be guilty of underestimating the power and the toughness and the resourcefulness of youth, and therefore that I may keep the young people in whom I am so interested from taking the chances and making the moves which might spell success for them.

Burdensome Expenses

For example, I am very much aware of the tax burden they've got to carry. It's double what it was when I was struggling with the same farms.

Then there's the cost of maintaining their mechanization. No matter how skillful they are in the use of their machinery, they've got to carry a load of expense for depreciation, repairs, and gasoline and oil. This is a load the farms they are operating haven't always carried. Time was when the pastures and the meadows furnished the bulk of the power used on these farms via horses and mules, and throughout this period I was always able to handle my horse and mule power so that it annually appreciated in value.

Finally, there's the all-important problem of the cost and efficiency of farm labor. There just don't seem to be any more hired men around like Jake Emmick and Wier Whitney who worked for me for years. Why, those fellows took their jobs so seriously that half the time I didn't know whether I was working for them or they were working for me!

Adding up the increased taxes, the cash costs of mechanized farming, and the trebled expense of farm labor my young farmer friends have got to carry, I confess the total scares me. Can they take in enough money to meet these expenses plus their feed, fertilizer and seed bills, and still have enough left over to support their families and make some headway in reducing their debts?

Fortunately, there's another side to the picture which indicates that they have some chance.

Better Trained

To begin with, I believe that most of the young men who have gone to farming in the United States are better trained and, in addition, every bit as good men—I really believe they're better men—than the fellows they're following.

Furthermore, I believe that they have wives who are just as good as they are—wives who know better how to feed their husbands and their children and who have enough gumption to get out and bring into the home some of the beneficial influences of the world outside the farm.

In short, the conditions under which the modern young farm family lives today, with an automobile to get to town, a radio in the home, a better conception of how the family should be fed, and constant association with

morale-building rural organizations, make that family a better bet for meeting the problems it must face than a family would have been thirty years ago. So while the problems they face sober me, it is with no lack of confidence in the young people themselves that I return to share these problems with them for the next six months.

Now may I discuss some of the questions we are going to have to thrash out as soon as I get back:

Trench Silo

Last summer at Sunnysables we took advantage of a cut we dug up through a bank which provides us with a road to the back side of the barn to test out the storage of a couple of hundred tons of grass silage.

I have already reported on the quality of this silage as it was taken out of this trench silo. It was uniformly good. At the same time we have run into some difficulties with the trench. Despite the fact that we put a big drain in the bottom, it got so muddy at times that it was difficult to back trailers into it to load them. Also, both of the banks have crumbled off some, one of them to quite a degree.

I believe we now have a total of \$125 paid-out money invested in this kind of silage storage. This figures out to be less than 50 cents a ton for silage storage.

Also, we have no fire hazard and no cost for fire insurance.

The problem that is now up is whether we shall put some more money into this type of silage storage—i.e. improve the drainage, possibly pave the floor, do something to stabilize the sides, and perhaps put a cheap roof over the whole trench—or make only the most essential improvements, or abandon the idea of this kind of silage storage altogether. How we work out this problem can mean a good deal to the fellow who finally has to pay the bill for whatever is done.

Chopped Silage

The question also arises, Is it necessary to chop grass in order to make good grass silage? Some experience is showing up which indicates that it isn't. Most of this, however, comes from England where a great deal of hand labor is used in filling trenches with chopped grass.

At the moment I am looking up everything I can to find out if we dare fill most of the trench silo with an unchopped, immature mixture of alfalfa and brome grass in late May and early June. I admit to blowing hot and cold on the idea and am anxious to talk it over with Jack Conner, who will pay the penalty if a mistake is made and benefit if the idea proves to be sound and saves him expense. Of course, the most important consideration and the one which will have the most impact on Jack's income will be the quality of the silage we're able to make by whatever method we use.

Baled Hay

As we've improved the quality of our hay crops, none of us has been satisfied with the manger quality of the hay we've baled. By the time we got a good crop ready to bale, it has been too often rained on, and we've generally found that we had to get it so dry that it lost a lot of leaves and the stems became harsh and unpalatable. Is there any other way we can deliver more

One of my friends sent me this picture of my Unimall as it appeared at the Cornell Farmers' Week. Perhaps you saw it there. Once we get enough Unimalls in this country, we won't have any more problems of surplus grains and we'll all have better food to eat.

palatable, more nutritious hay to our livestock and still save money on the method?

We could, of course, mow-dry our hay. In fact, two or three years ago we were ready to install a mow-drying system, and then cancelled our order for the equipment because we figured that grass silage put up when the hay should be cut, plus some baled hay, was a better bet. I'm sure that Jack and Boots aren't sorry we made this decision, because they haven't the mow-drying system to pay for and because of the very satisfactory experience they've had producing milk and growing young stock with grass silage as their principal roughage.

Supplements

One of the decisions we've also got to make is whether or not to use a supplement with grass silage. This is a very important decision because if it's "yes", it means that the boys will have to pay out some real cash. For example, the molasses or ground grain to mix with the grass silage it takes to fill Boots' 18x44 tower silo can just about wipe out his June milk check.

There's no doubt in my mind but what the use of supplements in making grass silage out of heavy stands of legumes results in better silage. The question is whether or not the expenditure is justified on farms which are capable of growing even more roughage than the livestock requires.

Irrigation

So far I've been discussing problems dealing with how the boys can save on paying out cash. Now let us consider the possible investments which might result in bringing in more cash. Late last summer we got a little experience with irrigation. It's fairly expensive to install, but no more expensive than a lot of other developments we have been accepting as necessary and therefore to be gone ahead with without question.

Actually, even though milk is cheap during the pasture season, particularly since they've improved their pastures, it is the time when the boys seem to go ahead in paying their bills and reducing their debts; but pastures are closely tied to rainfall. Therefore, why not eliminate the hazard of drought and slow down the effects of hot, dry weather by installing irrigation on fields where it is practical to do so? This is one of the developments I shall talk over very thoroughly with the boys.

Grass Fertilizer

Another expenditure to which we will give very careful consideration, particularly if we decide on irrigating some pastures, will be the purchasing of

more grass fertilizer in the hope that by using it we can cut down on reseeded expenses and on the feed bill.

I doubt if there is any investment which has paid the boys as well in the past three years as the treatment of their good stands of alfalfa and brome grass with about 400 pounds to the acre of 0-19-19 each fall. This same fertilizer applied at the same rate has given great results on their ladino pastures.

Better Fences

Another investment I shall talk over with the boys—fortunately, it does not call for much cash outlay—is the building of more and better fences so as to more closely control the grazing on their improved pastures. This will be particularly important if they go into irrigating pastures. The only way they will be able to get the most out of such pastures will be to graze them off when they are ready, and this means concentrating livestock on relatively small areas.

Lower Labor Costs

The dearth of good farm labor for American farms, on which I've already commented, has been met by and large by mechanization. Much of this mechanization has been made on an emergency basis. As a result, there is a good deal of machinery on all our farms which doesn't fit in with other pieces of equipment. We also have those situations of partial mechanization which sometimes actually require more labor than is necessary to do the job in the old-fashioned manner. One of the big challenges to the young mechanically-minded men on farms today is to come up with complete mechanization which is cheaper and better adapted to the job than the mechanization is that we now have on most of our farms. I could write a whole page about this and still not cover the subject.

However, the conclusion I draw from this situation is that the young men with whom I'm associated have got to buy their equipment very carefully in the future, and that whenever a new machine is bought on the farm, how it fits in with whatever is already there must be thought through.

Of course, there are many more problems which the boys and I will have to work on this summer. They are the reason why so many of us find farming the most interesting business in America. In time, we will discuss most of these, and occasionally I will report our discussions here.

(Model F-3, 122-inch wheelbase Express illustrated)

**says Louis P. Jensen
of Troy, New York**

"She keeps the budget in our family and knows just how much we're saving on gas, oil and upkeep since we changed to Ford. I agree—Ford Trucks certainly *do more per dollar!*"

"My wife says we save about \$16 a month with our new Ford Truck!"

"I picked Ford for power, but the money I'm saving has really convinced me it's the best all-around buy." (Loadomatic ignition saves gas; aluminum alloy pistons save oil; removable brake drums and engine-top setting save time and upkeep costs.)

"Never lets me down on any job! I use my Ford for every sort of work on my farm, in all kinds of weather." (To fit your job better—to save you money—a choice of over 175 models. From the 95-h.p. "Six" Pickup to the 145-h.p. "V-8" BIG JOB!)

"It's mighty good-looking . . . rides like a passenger car. The 'Million-Dollar' cab was good news to me, too!" (More good news for farmers is Ford's powerful, yet thrifty Six—the new 110-h.p. 254 cu. in. engine. It's engineered for heavy-duty farm use!)

"I knew they were Bonus-Built for extra strength, but I still can't get over how much less Ford Trucks cost to run!" (Find out yourself why Ford Trucks do more per dollar. Change to Ford like Louis Jensen did—see your Ford dealer this week!)

THE FARM PAPER OF THE NORTHEAST

Getting That Extra 10% Raising DAIRY HEIFERS

By J. D. BURKE

YOUR METHOD of raising calves and heifers in a large measure determines the producing ability of your herd. That is, the calves that you are raising this year and next will be your herd of cows three or four years hence.

Good breeding is the foundation of a good replacement program. The transmitting ability of the sire, the dam, and the cow family determine the inheritance of the cows in your future herd. You might say that the breeding program puts the "cow-power" into your cows. Artificial breeding, desirably proved sires, or carefully selected young analyzed sires are the best insurance for high producing ability in your future herd.

Regardless of the method of feeding or the particular breed, the second objective is to get the most desirable size on heifers by the time they are ready to freshen as two-year-olds. *Studies of New York D.H.I.A. records have shown that each additional 100 pounds of body-size has resulted in nearly 800 pounds more milk production per cow each year in the case of Holsteins and proportionate increases in the other breeds. Cows can consume roughage and other feeds in direct proportion to their body capacity or size, and producing ability follows the same trend.*

Grow Heifers Into Big Cows

Yet in spite of this evidence, the average Black and White heifer in New York weighs about 800 pounds as a two-year-old and matures into a 1,000-pound cow. This is one of the reasons why the average production per cow last year was only 6,400 pounds of milk. The accepted standards of size for two-year-olds are 1,075 pounds for Holsteins, 860 pounds for Ayrshires, 818 pounds for Guernseys and 750 pounds for Jerseys. Many dairymen are excelling these standards by 10 per cent or more. What an opportunity for improvement! An extra 100 pounds of growth on each heifer could increase production 10 per cent.

The first two months is the most critical period of the calf's life, and the way they are fed and handled at this period is extremely important. All calves should get several feedings of colostrum milk. The calf may be allowed to nurse the dam for the first three or four days, or it may be hand fed right from birth. Some dairymen save all colostrum milk and feed it along with herd milk to older calves as well. Colostrum milk is especially rich in vitamins, minerals, protein, and health

promoting factors. It is too good a feed to waste.

The amount of milk to feed will depend on the size of the calf and its age. Eight to ten percent of the calf's liveweight is a good thumb rule as to the amount of milk to feed a calf each day. The milk should be fed at about body temperature twice daily and in clean sanitary pails. Pails with attached artificial teats are convenient, save time, and give good results, but they must be kept absolutely clean.

Dry calf starters and milk substitutes have come into general use in the past few years. Experimental results have shown that calves grown on dry calf starters and about 350 pounds of whole milk do just as well as calves fed larger amounts of milk and with

a worthwhile saving in costs. (See editorial on page 4.) This 350 pounds of whole milk can be further reduced by the use of milk substitutes. However, when too little milk is fed, the calves may not do too well or be as thrifty during the second and third month as most dairymen would like to have them. The savings in cost from the use of these dry calf starters and milk substitutes will depend on the relative price of milk and concentrates. When the seasonal price of milk is low, one is justified in feeding more whole milk than when milk prices are high. There are many good dry calf starters and milk substitutes on the market and the manufacturers' directions should always be followed.

Probably no other feed is as important as high quality hay in feeding calves. A good hay is one that has been cut at the beginning of bloom or even earlier, and harvested in good curing weather to retain leaves and

(Continued on Page 19)

Plenty of first quality hay for growing heifers will lower growing costs and develop big barrels.

Big cows give the most milk. Each additional 100 pounds in body size will bring around 800 more pounds of milk a year.

MORE CABBAGE

MORE POTATOES

MORE CORN

Bigger Crops Go Hand in Hand With Full Fertilization

ON thousands of farms, yields can be increased far beyond the soil's natural capacity. Plant breeders have developed seeds with ability to produce tremendous yields—so long as they get the food to do it with. These bigger yields are the basis for lowering production costs on any crop.

Fertilization pays. Up to a certain point yields can be increased in direct proportion to the amount of fertilizer used. Soils vary in their supplies of available plant food, and crops vary in their needs. No one grade or analysis of fertilizer is suitable for all crops or soil conditions. G.L.F. makes many different grades to meet all crop requirements.

G.L.F. open formula fertilizers are mixed to supply the necessary plant food nutrients for maintaining soil productivity and increasing yields. They not only contain primary plant food elements—nitrogen, phosphoric acid and potash, but the special grades carry guaranteed amounts of secondary and minor elements needed for some types of crops.

Remember that fertilizer prices have gone up less than any other important farm supply.

For the most efficient and profitable use of fertilizer:

- Consider the requirements of the rotation as a whole, as well as the plant food needs of the particular crop.
- Select an analysis containing the plant food which your soil will not supply in adequate quantities to the crop which is to be grown. A fertilizer recommendation chart is now on display at your G.L.F. Service Agency for easy reference.
- Use enough fertilizer of the grade recommended by your state agricultural experimental station.

Cooperative G.L.F. Exchange, Inc.

G.L.F. Fertilizers For Abundant Harvests

3 reasons why Goodyear O-P-E-N C-E-N-T-E-R WEDGE GRIP gives you greater traction

1. Goodyear lugs are set closer together at the shoulder than at the center—don't flare out as in most tires. *Result:* soil is pinched, *wedged* between SUPER-SURE-GRIP lugs in a stronger, firmer grip.
2. Because Goodyear's husky lugs are set *straight*, they give you more gripping surface than lugs that toe in. *Result:* SUPER-SURE-GRIPS give you *full-lug* pull for their full length and depth.
3. Only Goodyear has this O-P-E-N C-E-N-T-E-R with even-balanced, equal-size, WEDGE-GRIP lugs. *Result:* more even pull, smoother ride, longer wear.

**You can see the result
right in the ground—
deeper, cleaner
soil penetration!**

The proof is in the fields all over the country!

Because farmers find SUPER-SURE-GRIPS *best* for traction, *best* for pulling-power, *best* for self-cleaning and *best* for wear, they've voted them their first-choice tractor tire, in a recent nation-wide survey!

Prove to yourself that SUPER-SURE-GRIPS give the greatest pull on earth. Just ask your Goodyear farm tire dealer to show you the WEDGE-GRIP action demonstrator. You'll see why SUPER-SURE-GRIPS are the tractor tires most farmers want!

WHY NOT THE BRANNAN PLAN?

OCCASIONALLY *American Agriculturist* gets a letter from a farmer asking in all sincerity, "Why not the Brannan Plan?"

There are a good many answers to that question, but the most important is that the Brannan Plan will cost untold billions of dollars. Not even its most enthusiastic supporters have dared come right out and say how many billions. Coupled with the Brannan Plan are proposals to put the farmer into the straight jacket of control, so that government agents would practically become dictators of all or nearly all of your farm practices.

The government has already indicated that it just will not stand by supports that cost too much when the taxpayers begin to howl about them. Therefore, the part of the Brannan Plan which would pay out to farmers might last just about one year, while the controls, once established, would be with you always. In a word, the Brannan Plan will put agriculture into a straight jacket such as has never been known in America, with only temporary financial aid. This is not my opinion only; it is that of most of the ablest and sincerest farm leaders and economists in the United States.

What do farm leaders and all others sincerely interested in the welfare of agriculture have to suggest in the place of the Brannan Plan? Most agree that the answer lies in flexible price supports, low enough to prevent over-production and surpluses; high enough to prevent good farmers from being ruined in times of depression.

"OH YES, YOU DO!"

I HOPE you are not like the fellow who said to me the other day that he wasn't too much worried about taxes because he didn't own any real estate, didn't draw a big salary, and therefore didn't have to pay taxes.

But I had the answer for him. I said, "Oh, yes, you do!" and pulled out and read to him the following figures, published recently in the *New York Journal American*:

Item	Retail Cost	Tax Share
Quart of milk	\$.21	\$.08
Loaf of bread15	.05
Package of cigarettes19	.11
Pound of meat70	.20
Bar of soap07	.02
Picture show ticket60	.20
Rent, month	60.00	20.00
Refrigerator	225.00	75.00
Coal, ton	20.00	7.00
Gasoline, gallon25	.11
Tire	18.00	3.00
Lawn mower	21.00	7.00
Hosiery, pair,	1.50	.50
Shoes, pair	9.00	3.00

Here is another way to think of our tax and public debt situation. It means nothing to say that the Federal debt is \$256 billion, but it does mean something to say that a Federal debt of \$256 billion means \$1,700 for every person in the United States.

In 1929 the debt per person was only \$133. In 1939 it was only \$319.

A STRONG DOSE

UNITED STATES Senator George D. Aiken of Vermont calls attention to the fact that on April 3 and 4, more than 5,000 county and community Production Marketing Association (PMA) committeemen met in St. Paul, Minnesota, to hear Secretary of Agriculture Brannan and others deliver political addresses, mainly in support of the Brannan Plan.

The committeemen from all over Minnesota were urged to attend and were promised that car drivers with one or more passengers would be allowed 5c a mile, and those coming by bus or train would be reimbursed for their fares. "In addition you will receive," said the letter of invitation, "a regular day's pay (\$8.00) for attending the meeting." If more than one day was required for travel and attending the meeting, up to two days' salary was authorized. Each of the 5,000 committeemen who attended was promised his regular per diem of \$8 per day and expenses.

In an editorial commenting on the meeting, the

By E. R. Eastman

Minneapolis Star said:

"The meetings wound up with the strongest dose of political medicine handed out in these parts in a long, long, time."

Senator Aiken said:

"It would be easier to excuse the \$50,000 to \$100,000 that this one meeting cost the taxpayers if the Secretary had stuck to the subject announced for the conference, namely, 'The Formulating and Administration of Agricultural Programs.' Instead, the Secretary devoted about two-thirds of his speech to promoting the so-called Brannan Plan, and the rest to the criticism of the American Farm Bureau.

"Every dollar," continued Senator Aiken, "spent in playing politics means \$1 less for improving the soil of American farms. I know of no authority which permits the Comptroller-General to approve the expenditure of Production Marketing Association (PMA) funds for the purposes for which they were used at St. Paul."

Should the U. S. Secretary of Agriculture, or any other office-holder, confine himself to administering the laws passed by Congress, the elected representatives of the people, or should such high executive officers be permitted to travel up and down the land, at the taxpayers' expense, high-pressuring Congress into passing legislation that the office-holder personally favors?

MILK WAR COSTLY TO DAIRYMEN

ONE OF THE most disastrous milk price wars in the history of the business has been in progress in New York City for months. The fundamental difficulty, of course, is an all-out effort by the dealers to keep or get more than their share of the market. The result, however, is that unquestionably most of the dealers are now operating at a loss on their New York City milk distribution. And the sad part of it is that those losses will eventually come out of dairymen. If the price cutting continues, many of the smaller dealers will be forced into bankruptcy, and all of them will bring all kinds of pressure on dairymen to reduce prices.

Because of the seriousness of the situation, many efforts have been made to get the dealers to compromise their differences, but with no results so far. Just as we go to press we are informed that Secretary Brannan of the United States Department of Agriculture has turned down a request to work with the industry to remedy the situation. This request was made by many leaders in the industry and ably supported by United States Senators Irving M. Ives and Herbert H. Lehman. As soon as the Secretary's refusal was known, the milk companies made still further price reductions.

ORCHIDS TO THE HOME DEMONSTRATION GALS

I LIKE to remember that when I was county agent in Delaware County, New York, the executive committee of the Farm Bureau and I decided that it was just as important to have a home demonstration agent in the county as to have a farm bureau agent. So an organization was set up and a gal from Vermont was hired as the first home demonstration agent in Delaware County—and one of the earliest home demonstration agents in the state. She made out eminently well on the job—so well, in fact, that the late Carl E. Ladd, then Director of the State School of Agriculture at Delhi, stole her from us. And now, since Carl's death, Mrs. Frances Ladd is Secretary of the New York State Federation of Home Bureaus.

Since that time, a large majority of the rural counties in the United States have organized home bureaus and hired home demonstration agents. That quite remarkable growth shows how well these young women have done, and how much their work is appreciated. Working with their county and state organizations, the home bureau agents have accomplished more than anyone else in improving the

American rural home and helping people everywhere to get some real living and happiness on top of the hard job of making a living. Perhaps their biggest contribution is what they have done to make wives and mothers, the homemakers, realize and appreciate that theirs is the most important profession in the world—bar none.

ON PLANTING PEAS

ON Saturday, April 8, we broadcast a small piece to peas. It started to snow before we got them all in, and there was snow on them more or less all the time during the next two weeks. Nevertheless, I'll bet we have a good crop of peas, and I bet we'll have them earlier than most folks in our latitude. (Tompkins County, N. Y.) What do you bet?

Have you ever had any experience in planting peas in the fall? Some people do this and get a good crop very early. One farmer I know of, however, sowed peas last fall, and the warm weather in early winter caused them to germinate and come up, with the result that they were killed.

Anyway, I wonder why people with plenty of land will bother to sow peas in a row when such good results can be had from broadcasting them.

FEED SURPLUS MILK TO GOOD CALVES

I HAVE a couple of Hereford steer calves which, although they are only about six months old, are nearly as large as yearlings. Their feed has consisted entirely of their dams' milk, plus what little good hay they wanted to eat.

When I look at those calves and remember other similar examples of what sweet milk will do, I wonder if dairymen couldn't use more whole milk than they do in raising their calves. It takes some courage, I know, to feed whole milk to the calves instead of putting it into the milk can, but if we did use more of the milk this way it would reduce some of the surplus that is troubling the industry so much now, and — what is equally important — it would give dairymen large, well-grown, and healthy replacements. What do you think?

EASTMAN'S CHESTNUT

A COW is an angular feminine bovine with four legs, an alto voice, a well established milk route, and a face that inspires confidence.

A cow's husband is a bull. A cow's brat is entitled a calf. Calves are generally used in the manufacture of Chicken Salad. Calves' brains can't be distinguished from scrambled eggs. When part of a calf gets breaded it is called a cutlet.

A cow provides vitamins for double chocolate malted milks until she is old enough to enter a can of corn-beef hash. Her tail is fastened to the rear of her back. It has a universal joint at one end and a fly swatter on the other.

A cow has two stomachs. The one on the ground floor is used as a storehouse for grass, loco weed, corn stalks, rock salt and the neighbor's cabbage. When the cow's storehouse reaches a state of either overproduction or under consumption she sits down in the shade of the old apple tree, and then belches like Henry the Eighth used to burp at a coronation banquet. This social error on the part of the cow makes some of the hay and stuff do a return trip from the storehouse back up to the front part of the cow's kind face, where it is fletcherized. This is where the trouble comes in, because a cow has no upper plate. All of her teeth are in the lower part of her countenance.

After this second-hand meal has been sufficiently gummed up by the cow, she sends back the order to the other stomach, where it is turned into cow meat.

An old cow has a tough time of it. In the end she gets skinned by those she has benefited, even as you and I.

A slice of a cow's rear end is very valuable to a cow, but it is worth only a nickel to a farmer, 16 cents to a meat packer, 46 cents to a retail butcher, and \$1.25 in a restaurant, not counting the tip.

—Anon.

AA's Farmers' Dollar Guide

FARM OUTLOOK: Winter wheat in some areas looks bad, but still promises a surplus. Bad weather in many southern states has cut fruit prospects and hurt some vegetables. For most crops, production will depend on weather. If it is good we will have another big crop year.

Relative to prospective profits for farmers in 1950, many economists figure that the general drop in farm prices which has gone on for past two years is about over. While there will be fluctuations in prices of individual products, economists believe the average of all farm products is adjusted to points where farther general decreases are unlikely. However, the farmer who continues to make money will be the one who watches costs with an eagle eye. This is not pleasant or new, but it will continue to be important.

FARM PLANS: Because of increasingly serious consumer resentment about the cost of farm price supports and news about destroying food, several farm plans are being developed which are designed to operate without tax money. One is being worked on by National Milk Producers Federation and proposes financing through an equalization fee levied on the first commercial sale of the commodity. We understand that basic objective of two other plans is the same. They may be presented to Congress next year.

Many defenders of farm price supports by government point out that for years business has also enjoyed favors, such as protective tariff. However, opponents of price supports reply that no business has ever been guaranteed a profit, as efficient potato growers have in recent years.

SMALL BUSINESS HELP: Argument often cited is that sooner or later if farm supports continue, business will demand similar guarantees. Apparently government is planning to help small business even before demand is made. It is predicted that Congress will soon pass legislation to provide loans up to \$15,000 to small businesses. Banks will make loans but government will insure repayment so banks can't lose. Two ideas behind the expected legislation are: 1. That it will be good politics and it will convince the "little fellow" that the Administration is for him. 2. That it should help some small businesses to expand, perhaps provide more jobs—and maybe more taxes.

SPREAD: Concern is expressed over fact that retail food costs have not dropped as much as farm income. No one should be surprised, because that always happens when the price level declines. Reason: Wages which make up the biggest part of transportation and marketing costs have gone down little or none. There is some talk of a congressional investigation, but expected results are hazy.

A LESSON: Union milk drivers in New York City have been successful over the years in getting higher and higher pay. One result is that 70% of the milk in New York City is now sold through stores and only 30% delivered to doorsteps. In other words, milk drivers' pay is high but fewer and fewer milk drivers have jobs. The lesson here is one which labor union leaders apparently will not learn.

BRIEFS: ● Butter and oleo are fighting for the consumer market. American Butter Institute has asked USDA to reduce price support 3 cents per pound to help meet oleo competition. Oleo manufacturers are planning a huge promotion campaign.

● Secretary Brannan, commonly regarded as an advocate of high supports on farm products, could have announced higher supports on several commodities than were actually announced. Apparently he is in a dilemma between desire for high supports and the practical necessity of keeping costs of support programs as low as possible.

● For some time dissatisfaction has been expressed relative to government grades of beef. Changes are predicted soon, as follows: "Prime" grade will include present "prime" and "choice;" "choice" will correspond to present "good;" "good" will be the better cuts of what's now "commercial," and "commercial" will be mostly the older, tougher animals. Reason is that very limited market—mostly top hotels and night clubs—wanted "prime" beef, which has high percentage of fat. Nevertheless, consumers who bought "choice" figured they were taking second best, and it was charged that producers took prices lower than necessary.

—H. L. Cosline.

The Song of the Lazy Farmer

THE difference in philosophy between my neighbor there and me is illustrated crystal clear by why the weather gives us fear. For instance, this dry spring we've had has made poor neighbor very sad; he's really been down at the mouth, he's sure we're headed for a drouth. "I wouldn't be surprised," he pouts, "if what I've planted doesn't sprout; and even if it does," says he, "it prob'ly will burn up, by gee." It's really quite a funny sight to see him leave the field at night; the dust has made his face coal black except where tears have left a track.

For me, also, the weather's had no tendency to make me glad, but in a slightly different way, for when it's dry day after day the fishin' worms are hard to find and scarce as hen's teeth are the kind that make the big ones lose their fright and guarantee I'll get a bite. But I don't let it get me down, I still can smile instead of frown, despite the fact that my complaint is sensible while neighbor's ain't. The way I figger, if we get a summer that is never wet, 'tis better to relax a bit than have a breakdown over it.

"ISOTOX Dairy Spray is the fastest fly killer I've ever used!"

John Ryan and his brother Jim own two 400 gallon, 1000 lb. pressure spraying machines and specialize in dairy fly control spraying

SAYS JOHN RYAN: "I have been using ISOTOX since March, 1949, with excellent results. It is the fastest-acting fly killer I have ever used—and it is giving me at least thirty-day residual control.

"My customers are all well satisfied. Many claim ISOTOX gives them the best fly control they have ever had."

The Ryans' experience is typical. Dairymen from all parts of the country are reporting fine results with ISOTOX Dairy Spray. Get the facts—write today to nearest address below for free illustrated folder on low cost ISOTOX Dairy Spray!

So powerful, a little goes a long way!

ORTHO
SCIENTIFIC PEST CONTROL
REG. U.S. PAT. OFF.

ISOTOX Dairy Spray containing lindane is a wettable powder. You use it at the rate of 10 pounds to 100 gallons of water.

Roughly, one pound makes enough spray to treat the average barn. ISOTOX Dairy Spray is packed in 1-pound and 4-pound cans and 20-pound pails. Also available as liquid spray and in dust form

Also controls mange, lice, ticks and many other pests

Contains
USDA-approved
LINDANE

at a New Low Price!**

STRAN-STEEL
Quonset 24
Special

Framed With N-A-X Alloy Steel, The Quonset 24 Special Sets a New Standard in Farm Building Value!

*Patented and produced by Great Lakes Steel Corporation

The use of a stronger, tougher steel for frame members has simplified construction and reduced costs to the point where this new Stran-Steel building value can be offered at a price you can afford to pay.

And its low first-cost isn't the only savings! Because there are fewer framing members in the Quonset 24 Special the owner can expect faster erection and lower erection costs.

Ask your Quonset dealer about the proved advantages of this new Quonset. Ask about its multi-purpose usefulness, its great strength and durability, its high resistance to weather and corrosion. Unquestionably the Quonset 24 Special is America's greatest value in farm buildings.

This barn on Roy Mauger's farm is larger than it looks. Typical of many Delaware County, New York, barns, a large part of it is below the barn floor level. A corner of the comfortable modern house is shown at the left.

Five Steps to FARM OWNERSHIP

By H. L. COSLINE

IT IS NOT EASY for any young couple to become established on their own farm. Yet in some way thousands of young people must do so as older farmers retire because of desire or necessity. And young people ARE buying farms, just as Roy Mauger and his wife bought their farm near Delhi, Delaware County, New York.

I stopped in to see the Maugers recently, and as I listened to their experiences it seemed to me that every young couple must go through at least five steps in acquiring a farm:

1. *Learning.* Back in the 30's Roy was a student in vocational agriculture in a Pennsylvania High School, and in 1936 he came to Delhi for a two-year course at the State School.

After graduation, he worked on a farm to get experience. In 1940 he was married and continued to work as a hired man for three years. Always his goal was to own his own farm.

2. *Saving.* It is very obvious to anyone that it is difficult to save money. There are always things which we want and which can be bought either for cash or on credit. Roy did save, because in 1943 when he and his wife decided to try farming for themselves, he was able to make a substantial down payment on a 100-acre farm seven miles from Delhi.

3. *Building Confidence.* Probably neither Roy nor his wife consciously worked at building up confidence in their ability to handle a farm, yet they were doing it. Through Roy's thrift, good sense and good farming, he had made an impression on the community which resulted in his ability to borrow the balance of the purchase price from an individual who had the money to lend.

4. *Buying.* The actual purchase of a farm requires good common sense and good business judgment. First, there is the matter of picking a farm which will enable the owner to make a good living and have enough left to make regular payments on it. Then there are such matters as determining a rate of payment which can be met, seeing that the title is clear, and many other important details.

5. *Succeeding.* Once the contract has been signed, the deal is not finished. Actually to own a farm free and clear, a young couple must succeed at farm-

ing, and Roy Mauger and his wife are doing that. There are many recipes for farming successfully, but one is that a farmer must keep his production costs below his expenses. To do this Roy has built up a productive herd. He has cut

Mrs. Mauger is interested in every activity on the farm. In addition to caring for the home and her two young children, she likes to know what the herd is doing as shown by the Dairy Herd Improvement Association record.

costs by improving pastures; he has a business large enough to be efficient, and the farm on which he now lives is in an area where the land is fertile.

There is one more important element in purchasing a farm which we might call "luck" or "circumstance," but the couple who lean on this factor too heavily are certainly doomed to disappointment. I am referring to the many young people who inherit some money or property. This boost is seldom as big as the neighbors think it is. Often there are brothers and sisters or other relatives who share in the inheritance, and usually there are obligations which must be met, and repairs which must be made in case inheritance is in the form of property.

I put some emphasis on this because the farm which Roy Mauger and his wife now operate is not the one which they bought back in 1943. In 1945 Mrs. Mauger's mother passed away, and there seemed to be no one else to take over the farm. The first farm was sold, the old home farm purchased, and the couple moved to the present farm, which is nearer to Delhi, is larger, and doubtless a more efficient unit.

McCormick No. 62 combine with pick-up attachment harvesting windrowed oats. You don't need to wait for the crop to be dead ripe before you cut it with a windrower or swather. Then, in a very few days, the crop is ready to combine.

Here are the **BIG COMBINE** features of the 6-foot

McCormick No. 62

McCormick No. 62 combine with auxiliary engine and regular equipment including 6-foot cutter bar, 4-bat reel, and 25-bushel grain tank with unloading elevator.

Also, McCormick 12-foot Combines

No. 122-C. Cuts a 12-foot swath and has threshing capacity to match. Powered by its own 6-cylinder engine; can be pulled by a two-plow tractor. Controlled by hydraulic power from the tractor seat. Has all the McCormick clean-threshing features.

No. 125-SPV. The 12-foot self-propelled combine that's widely preferred where large acreages are grown. Recently improved with new low grain tank and unloading elevator, new variable-speed cylinder drive, new wide-tread steering wheels, and new V-belt drives.

Now, in a general-farm-size combine, you can have the timesaving, crop-saving advantages that have made the bigger McCormick harvester-threshers so popular. For the 6-foot McCormick No. 62 is designed and built like the McCormick 12-foot models. Here are a few of the *big combine features* that have made the No. 62 famous for easy handling and for clean threshing of all threshable crops:

Clean threshing. Straw is moved through this combine in a *straight line* from front to back, so that a large volume can be threshed clean without clogging. The No. 62 is a *balanced* combine: the separator is the right size for the sickle bar.

Variable-speed cylinder. In a few minutes you can set the cylinder drive for any cylinder speed from 585 to 1700 r.p.m., simply by turning an adjusting

hand wheel on each of two easily-reached V-belt pulleys. No special tools, no parts to remove and replace.

Adjustable concave grate. You don't have to remove and replace the concave when you begin combining a different crop. By turning two adjusting screws you make the grate openings any needed size from $\frac{9}{32} \times 1$ to $\frac{7}{8} \times 1$ inches.

Rotary straw rack. Riding on two crankshafts revolving at 226 r.p.m., the McCormick straw rack is fast and efficient in finishing the separation of grain (or seed) and straw.

Auxiliary engine (optional). When operated by its own engine, the No. 62 combine can be pulled by a medium-sized tractor. The engine drive keeps the separator running at the correct speed for clean threshing, regardless of how the tractor throttle is opened and closed.

See your International Harvester dealer about a McCormick combine now, to be ready for harvest season. Convenient payment terms if you wish.

FREE BOOKLETS—Here's help in deciding which McCormick combine will suit you best . . . free booklets telling all about each of the three. Mail the coupon today for any or all three booklets.

CASE 5-FOOT "F-2" COMBINE

So Simple

MOST ANYBODY CAN RUN IT

So Low-Priced

MOST ANY FARMER CAN HAVE HIS OWN

✓ 3 SIMPLE ADJUSTMENTS

Men without experience quickly get good results. A single lever adjusts concave instantly to suit kind and condition of crop. Fan blast and sieve opening are easy to reach and set from outside machine.

✓ COMPACT—HANDY FOR SMALL FIELDS

So easy to maneuver that you can get into odd patches, irregular areas between contoured rows. You can save seed from legumes and other soil-saving crops. A big help in conservation farming.

✓ CAPACITY FOR BIG YIELDS

Full five-foot cut, 28-inch rub-bar cylinder, long unit-type straw rack, and Case "air-lift" cleaning give capacity to take care of heavy crops. Pick-up attachment (extra equipment) handles full-size windrows.

✓ STRAIGHT-LINE STRAW TRAVEL

The cut crop goes straight back from the sickle, through the cylinder, and onto the rack with no turns to slow it down and cause bunching or reduce capacity. Seed-tight construction from header to tailboard.

✓ POWER TAKE-OFF DRIVE

Does fine work with power of 2-plow and larger tractors, saves cost of extra engine. Engine attachment will be available in limited numbers. Fittings for hydraulic header control by ASAE standard cylinder are extra equipment.

A size and type for every farm. Besides the 5-foot Model "F-2," Case makes 6, 9, and 12-foot engine-driven pull-type combines, 9 and 12-foot self-propelled models. All are built with or easily adapted to hydraulic header control. All are backed by 108 years' experience. See your Case dealer about the model that fits your farming.

The "Newer" Organic Insecticides

By G. S. HENSILL
California Spray-Chemical Corporation

THE agricultural insecticide situation has undergone a major change in the last several years. Where previously agriculture was concerned with inorganic insecticides, such as lead arsenate and cryolite, and botanical insecticides of plant origin such as rotenone, pyrethrum and nicotine—today, agriculture is concerned with newer organic insecticides which have posed new problems of plant tolerances, poison residues and other factors.

Lindane

Lindane is the common name selected last July for the pure gamma isomer of benzene hexachloride. It retains all of the insecticidal effectiveness of benzene hexachloride (BHC) but is practically odorless because the other odor-imparting isomers of BHC are eliminated. Lindane is much more readily made into liquid sprays than BHC as it is over ten times as solvent soluble. It is also readily formulated into dusts and wettable powders. It is an excellent aphid control and an effective control of various beetles and caterpillars. It is more effective against thrips than BHC, and even DDT, because of its penetrating, vaporizing action.

Lindane can be used on many sensitive plants, such as cucurbits and some other vegetables and crop plants which are damaged by BHC.

As there is no danger of poison residue accumulation in animal tissues and milk, Lindane was approved last July by the U.S.D.A. as an effective fly control insecticide for use in dairy barns and milk-processing buildings. Lindane can also be used for control of mange, lice and ticks on livestock, and in household and building pest control.

Tetraethyl Pyrophosphate (Tepp)

TEPP is one of the finest insecticides ever produced for the killing of red spider mites and aphids. It is also effective against leafhopper nymphs, thrips and some other insects.

It is necessary to use up diluted TEPP sprays immediately. Action on the insects is rapid and effective at low dilution rates and is a very valuable insecticide for use on fruits and vegetables up to within a day or two of canning, processing or marketing, without danger of poison residue. Yet TEPP is over a hundred times more toxic than DDT.

Parathion

Parathion is another organic phosphate insecticide recently introduced into agricultural usage which has shown excellent control of red spider mites, aphids, and some other insects. As compared to TEPP, it has a longer residual activity lasting up to several days, but is higher in chronic toxicity and more dangerous to warm-blooded animals. Parathion, therefore, requires a great deal more care in handling and application. As there is some evidence of buildup of residue in fruits and vegetables, its use has to be restricted to times not too close to harvest.

(Use Parathion with extreme care and caution. See Editor's note at conclusion of article. Page 15)

DDT

DDT (dichloro diphenyl trichloroethane) controls Codling moth on apples and pears; caterpillars, leafrollers and other pests on fruit trees; and a wide range of pest insects, such as caterpillars, beetles and thrips on vegetable crops. DDT's chief value as an insecticide is its residual action and its two-way action of a stomach and contact poison. In addition, it is readily adapt-

able to dust, wettable powder and emulsive-liquid formulations. It requires care in application to avoid residues on crops maturing for food usage.

Its wide use in other fields, such as fly control in dairies, has brought about some repercussions on the residual problem of DDT in foods. For that reason there has been some government restrictions concerning the use of DDT on certain crops, on foods for cattle and in and around dairies.

DDT Relatives

One of the close relatives of DDT, dichloro diphenyl dichloroethane or DDD, has had considerable usage for control of certain specific pests, such as tomato hornworm larvae, cutworms, and various fruit worms infesting tomatoes. Its characteristics and action are similar to DDT, but its use will probably be restricted to specific pest control due to cost of production and other factors.

Methoxy-DDT has had some use in agricultural areas. To date, its use has been more in fly control and public health work than in actual agricultural usage. It has some specific characteristics but in general nature is similar to DDT and DDD. The same cautions in use are not necessarily applied to DDT and Methoxy-DDT as it has not been proved that they accumulate in the body tissues.

Benzene Hexachloride

About the time DDT was being used in the United States during the recent war, benzene hexachloride was rediscovered and developed as an insecticide in England. Because of its three-way action of stomach, contact poison and vapor action poison, BHC has excellent insecticidal properties and is effective against a wide range of insects. Soil treatment is one definite advantage of BHC on some crops as it has been found to be an excellent insecticide for control of wireworms.

Toxaphene

Toxaphene has been found to be generally useful in control of grasshoppers, crickets, cutworms infesting various fruit tree and vegetable pests. Uses in other lines are also being developed, such as control of thrips, leaf-miners and red spider on fruit trees and possibly ornamentals. It has had large usage on cotton but not extensive usage on fruit or vegetable crops. In acute toxicity it is about four times as toxic as DDT.

Chlordane

Chlordane is especially outstanding in control of ants (also roaches) and has been used widely for that purpose in commercial pest control operations.

COW
in your
4 month
Calf

**Feed PURINA CALF STARTENA
and have Big, Rangy Heifers
by 4 months**

Do you like to raise big, heavy-milking, long-living cows?
When you follow the Purina Calf Plan, you can see the cows
you want *already developing* by the time your calves are 4
months old. Here's why:

Calf Startena is a carefully blended *dry* feed that takes the
place of all but 15 to 20 gallons of the milk or gruel usually
fed. It is concentrated and very tasty . . . gets more actual
food solids into calves than they could possibly get from
many times more milk or gruel, which are mostly water.

A test on one or two calves will quickly show you the differ-
ence. Get Calf Startena from your Checkerboard Dealer. Takes
only 300 to 400 lbs. per calf, so it costs only half as much to
feed as milk.

Let's Plant a Garden

Spring is here. As we used to say in
the country where I came from, it's
time to plant "garden sass."

A friend gave me some directions on
how to plant a garden which she copied
from a blackboard in ■ Unity Center
in Santa Monica, California.

1. Let Us Plant Five Rows of Peas—

Presence
Promptness
Persistence
Purpose
Privilege

2. Three Hills of Squash—

Squash gossip
Squash indifference
Squash criticism and
condemnation

3. Four Rows of Lettuce—

Let us be faithful
Let us govern our lives by loyalty
and truth
Let us be true to our obligations
Let us love one another

4. Four Rows of Turnips—

Turn up with new ideas
Turn up with ■ smile
Turn up with enthusiasm
Turn up with determination

I shared these thoughts with our
Ralston Purina family—and from all
parts of the country my friends have
added to my "garden sass" with many
more vegetables, berries and flowers:
"Beet" (Beat laziness, Beat indiffer-
ence, Beat last year's records); "Ber-
ries" (Bury grudges, Bury intolerance,
Bury fear); "Flocks" of energy;
"Stocks" of happiness; etc., etc.

Wouldn't you like to try your own hand
at planting "garden sass" which will
add to an abundant life?

Daringly yours,

WM. H. DANFORTH
Chairman of the Board
RALSTON PURINA COMPANY

I CHOSE
WEEDONE
 BRUSH KILLER 32
 BECAUSE OF ITS
LOW VOLATILITY
 AND
GREATER KILLING POWER

There's nothing like it. It contains the butoxy ethanol ester of 2,4-D and 2,4,5-T, and kills where you aim it—vapors do not injure susceptible plants nearby.

Yes, you can spray close to beans, cotton, tomatoes and the like—for all practical purposes it is non-volatile.

KILLS OVER 100 WOODY PLANTS

This butoxy ethanol ester formulation gave a spectacular kill in '49 on the brambles (blackberry, raspberry, etc.), poison ivy, poison oak, certain species of oaks and pines, wild rose, osage orange, willows, wild cherry, hickory, buckbrush, sagebrush, elderberry, coralberry, honeysuckle and many other woody plants, as well as thistles, knapweed and other perennial weeds.

SPRAY NOW. Clear pastures of bramble and brush patches, and get a permanent stand of grass your livestock can eat.

Clear irrigation ditches of choking weeds.

Clear fence rows, bottom land and roadsides of brush that robs nearby crops of moisture and plant food, while giving shelter to harmful insects.

ALSO AVAILABLE—FOR SPECIAL BRUSH PROBLEMS WEEDONE 2,4,5-T

Contains 4 lbs. 2,4,5-T acid per gallon. Another great butoxy ethanol ester formulation.

CONTROL WEEDS IN CROPS
WEEDONE LV-4
 Contains 4 lbs. 2,4-D acid per gallon

A new butoxy ethanol ester formulation for killing weeds in corn and small grains.
 Where vapor damage is a problem, get the killing advantages of an ester with the safety of this more effective, low volatile butoxy ethanol ester.

See your dealer for full information. Or write to us direct for free bulletins.

Orchard and Brome Grasses in Modern Pasture Mixtures

By Jim Hall

DID you ever wish that you could have experts in agronomy, animal husbandry, plant breeding and field crops sit down with you to plan what to do with that pasture lot next to the barn?

Well, I can tell you that they'd ask a thousand questions before outlining the management program and seed mixture they would recommend. I sat around a table with a group of these specialists late this winter and watched them build up a program for a 14-acre piece of Ontario loam on the Hayfields Farm of T. E. Milliman in Monroe County, N. Y.

Tom Milliman said, "Here's this piece of land ready to be seeded this spring. I'll do with it whatever you recommend in order to make it give maximum grazing, and I'll make the pasture available for demonstration and inspection by farmers, beginning with its establishment and continuing through 1953." Tom also said he'd maintain his D.H.I.A. records and keep a complete record of number of cow-days pasturing to show milk yields by day, month and season.

Sitting around the table with Tom were: Richard Bradfield, head of the Department of Agronomy; J. D. Burke, Assistant Professor of Animal Husbandry; W. K. Kennedy, Professor of Agronomy; H. A. MacDonald, Associate Professor of Field Crops Agronomy, and R. P. Murphy, Professor of Plant Breeding, all of Cornell, and George H. Serviss, G.L.F. Agronomist.

Past History

Their questions brought out that this particular field was in straight alfalfa from 1940 to 1942; produced 75 bushels of shelled corn per acre in 1943; oats in 1944; alfalfa-brome mixture, 1945-1948. In 1949 it produced 91 bushels of shelled corn per acre and was in corn stubble to start 1950. It received liberal amounts of manure in 1948, '49, and '50, and had good applications of 0-19-19 twice during the brome-alfalfa period. Tom plans that this will be his main pasture in 1951, and he said he will have 34 milkers pasturing on it and can put in more dry stock if necessary to hold it down. The authorities also determined that the soil was in good shape as far as potash was concerned.

With this information, the specialists made the following recommendation: The field should be plowed just as soon as it is in good condition and oats

sowed at the rate of 2 bushels per acre, together with 400 lbs. to the acre of 6-12-6 fertilizer. They recommended that the grass and legumes be seeded immediately after the drill puts in oats and fertilizer. Tom will use a modern cultipacker tool with 2 seed boxes mounted above and between the front and rear gangs of packers, the one box being for coarse seed like brome and orchard grass and the other for legumes.

The field will be divided, 7 acres on each side, in such a manner that the cattle will have the same feed through half the field and access to water at a tank in the barnyard. This will be arranged by an electric fence.

Seeding Mixtures

Seeding mixture No. 1, for the West side of the field, is to consist of: Northern Variegated Alfalfa, 5 lbs.; Ladino Clover, 1 lb.; Southern Brome Grass, 16 lbs., (the Southern Brome Grass is to be either Lincoln or Achenbach), and this half of the field is to be clipped if it gets ahead of the cattle. Seeding mixture for the other half of the field, which is planned to be ready for early pasture between April 19 and 26, 1951, is to consist of: Northern Variegated Alfalfa, 5 lbs.; Ladino Clover, 1 lb. and Orchard Grass, 8 lbs.

Seeding was to be done between April 25 and May 1, with the oats ready for grazing about June 10th. Mohawk oats, because early and stiff-stemmed, was recommended and is to be grazed by turning the cows in just before it heads.

Tom agreed to top-dress the pasture with 400 lbs. of 0-19-19 with borax at the completion of the first round of grazing in each year, and to apply manure at least every other year.

Everyone present warned Tom that the field containing the orchard grass would be ready for grazing some time between April 20 and April 26, and would be soft and subject to much punching, but also agreed that this never seemed actually to harm the seeding.

Mr. Milliman said this pasture may be expensive to establish, but that he has confidence in the judgment of the specialists and is convinced that it cannot fail to be profitable. He will start keeping books on the pasture just as soon as the milking cows are turned in to graze off the first crop of oats this spring.

Getting a Stand of Birdsfoot Trefoil

GETTING a good stand of birdsfoot trefoil has been rather uncertain for many farmers to date. Some farmers have seeded it several times and never missed a seeding; others have tried it once or more with very poor results. The chances of success will be pretty good if these suggestions are followed:

First, the soil should be limed to the point where it will grow good red clover.

Just because birdsfoot trefoil will exist at somewhat greater soil acidity than red clover does not mean that it is good business to try to establish it on a very acid soil without lime.

Second, inoculate the seed and do a thorough, careful job.

Third, the surest way to get a stand is to seed it clear without a nurse crop. Weeds, though, are likely to be quite a problem when it is seeded in this

manner. To reduce the weed problem it is good business to delay seeding. Stimulate the germination of weed seeds a couple of times by harrowing, and then harrow to kill the weed seedlings. Not many farmers are likely to follow this procedure, so the second choice is to seed the trefoil with oats but not to sow more than five pecks of oats to the acre.

Fourth, trefoil definitely responds to fertilizer, and a small amount of nitrogen while it is getting established seems to be helpful.

If the field was manured last year, there may be plenty of nitrogen and straight superphosphate or 0-20-20 may be sufficient. If the field was not manured, I would be inclined to use 5-10-10 or 6-12-6 at a rate of from 400 to 500 pounds to the acre.

—George Serviss

I Have Faith in the Future for Growers of Good Fruit

By Ed Mitchell

IT SEEMS quite obvious that all who have faith do not wind up with a fortune, but it is equally true that, without faith, one's chance of making any headway at all is very remote. Therefore, bolster up your faltering faith in what crops and prices may be when harvest time rolls around again and pitch in with determination to produce the best crop ever. This is especially intended for the apple growers, of whom I am one, and by the time you read this we should have a fair idea of crop prospects for the coming year.

One reason it is so important to have faith and keep trying is that just enough people lack that spark so that those who do keep on have a good chance of winning out. This is especially true of apple growers and those others over whom the federal government has not cast a protective wing of price supports and controls. Personally, I would much prefer to take my chances with natural laws of economics than the artificial rules and regulations of any government. Economic laws follow some sort of a pattern that affords some chance for study, understanding and prediction, which certainly does not apply to the whims and wiles of laws made by politicians.

Consumers Do Eat Apples

Some things seem certain enough to be accepted as facts. The production of apples has been decreasing, while the population—our prospective customers—has been increasing. We have just moved one of the largest crops on record, which proves people will eat apples—all we can produce—if they are cheap enough. Extra fine apples brought a pretty fair price in spite of the low price of poorer ones, which shows there is always a chance for the best fruit to show a profit and that some growers can show a profit or at least get by even in a year of big crop and low prices. If one man can, then

we can, too.

Apple growing, and in fact most fruit growing, has this insurance against sudden overproduction: it takes several years to get a fruit tree to bearing age, and it is not an easy or inexpensive thing to do. Eggs, milk, pork, beef and vegetable crops, as well as the field crops, all offer a better chance for sudden changes in supply than growing fruit, so although it is easy to go OUT of the apple business by neglecting your orchard just one year, getting into it is a long-time, expensive proposition.

I suspect there is an awful day of reckoning due for those who have government protection and price supports, and I would be nervous if there was a storage supply of dried and canned apples hanging over my future marketing, as there is in the case of eggs, milk and some other things. Be thankful that perishable crops do perish and we can start each year with a clean slate.

Production Costs

I have a lot of faith in the ingenuity and ability of our chemists and manufacturers and scientists. I think they will develop new spray materials and machines and methods fast enough so we can cut costs and increase quality to keep abreast of market demands and prices. Sometimes we seem to lag a little bit behind, and costs get ahead of returns, but that situation can not continue for very long, so there must be some change. Those who can weather the storms will be on hand to enjoy the change when it does come. The rest will be doing something else, and probably not as promising.

Keep the star of faith shining as you tinker up the old machines and slough through the mud, and fortune awaits you at the end—or at least we all hope it does.

I think it is going to be a good apple year. It had better be!

The Question Box

How can thin cracks in a plaster wall be filled? The cracks are too small to be plugged with patching plaster.

Use a combination of white lead and turpentine, mixed to a creamy consistency. This should be applied with a cloth. It can be sanded smooth after it hardens.

How do "contact" insecticides differ from "poisons"?

There are many kinds of insects but, in general, they are divided into those that chew and those that suck juices from the plant. The ones that chew can be killed with a spray containing a poison, but those that suck juices from inside the leaves do not get any of the poison and, therefore, are not killed. This type of insect is often controlled by some material which kills when it hits the insect. One of the latest insecticides of this type is DDT but there are many others, including rotenone and tobacco products.

In fertilizing crop land, is it essential or logical that an attempt be made to put back the amount of minerals which the crop removes?

Fertilizing on that basis is no guarantee of a good crop. Equally important for growing crops is good tilth, good drainage, and a good supply of

humus. On the other hand, a heavy crop does remove more minerals than a poor one and calls for heavier fertilization, which can well be based on the recommendation of your state college or experiment station.

How can tarnish be removed from brass?

Wash the brass with vinegar in which as much salt as possible has been dissolved. Follow this treatment by washing the object with clear water. Copper can be cleaned in the same way.

"Your Question Department is a very great help, and I don't like to stump it with the impossible, but for the sake of the Apple Industry, will you please tell your readers where an apple parer suitable for home use can be bought?"

If any reader can answer this question we will be very glad to have the information.

How can oil stains be removed from a concrete floor?

Sprinkle dry portland cement or hydrated lime on top of the oil. If the oil has not penetrated deeply into the concrete, it will be absorbed after several days. Concrete basement floors should be cleaned before painting or resurfacing them.

"Mister, You're a Genius!"

"A MATTER OF MINUTES AND YOU'VE GOT HER RUNNING LIKE NEW!" I TOLD THE MECHANIC.

"THAT'S EASY," HE REPLIED. "WHEN YOU'VE GOT THE RIGHT PARTS, THERE'S NOTHING TO IT."

"RIGHT PARTS?" SAID I. "YES, GENUINE FORD PARTS," HE CONTINUED. "THEY'RE MADE RIGHT TO FIT RIGHT TO LAST LONGER."

"AND, BECAUSE THEY'RE DESIGNED BY THE MEN WHO DESIGNED YOUR FORD, THEY SAVE YOU TIME AND MONEY."

"THAT'S WHY YOU'RE SMART TO LOOK FOR THIS SIGN (AT FORD DEALERS AND SELECTED INDEPENDENT GARAGES). AND ALWAYS SPECIFY GENUINE FORD PARTS."

KEEP YOUR FORD ALL FORD!

Make Better Hay Easier-Faster

With a 4-bar cylinder, the Massey-Harris No. 11 Side Delivery Rake is built for big capacity at fast tractor speeds.

The Massey-Harris No. 8 Loader is famous for handling hay gently, an important factor in making high quality hay.

The Massey-Harris Forage Clipper cuts, chops, loads any grass or legume crop in one, easy, time-and-labor-saving operation. (Shown with windrow pick-up attachment.)

THE Massey-Harris No. 6 Mower cuts more than hay — it likewise cuts mowing-time and hay-making costs.

With its two caster wheels, one on either side, the No. 6 is literally a contour mower. It hugs the ground to do more uniform work...to cover more acres...to do a cleaner job of cutting...and with longer life for the cutter bar, pitman, bearings, and drive shaft.

Of welded tubular construction, the No. 6 is ruggedly built. Husky roller bearings in the right places make it a lighter running, longer lasting mower. Guarded with safety shields, and an automatic safety release, it's as safe as a mower can be made. And you'll find it easy to attach and detach.

See your Massey-Harris dealer for all the facts about the No. 6 — in 6 and 7 foot sizes. Ask him for a copy of the latest folder on all Massey-Harris Hay tools, or, use the coupon below.

A Visit With the Editor

ONCE in a while in an occasional issue of *American Agriculturist*, when there is a little extra space to spare, I'd like to visit with you just as I would if we were sitting around the fire in winter or under the old apple tree in summer. Sometimes I'll talk about real life experiences like those in this piece, and other times about some of the farm and home problems that bother all of us in these complicated days. I'll welcome a return visit from you in the way of a letter commenting on anything I have said here or on any other subject that you want to write me about.

Something over a year ago Joe Hanley, Lieutenant Governor of New York State, had the misfortune to lose an eye. At the time it happened a small boy wrote to him telling him not to feel badly about losing the eye because, said the boy, "I've lost one of mine and don't hardly miss it."

Joe was delighted with the boy's letter and immediately answered it. He found that the lad was only 10 years old and had written without his parents' knowledge. The Lieutenant Governor invited the family to Albany and gave them a day in the State capital and in the Senate (over which Joe presides) that they, and especially the boy, will never forget.

Not long after that, Mr. Hanley was walking along a New York City street when a gust of wind filled his good eye with dust, completely blinding him. He tried to stop two or three of New York's indifferent passersby before he finally managed to get the attention of one of them, who called a traffic cop to help him. The cop said:

"What can I do for you, bud?"

The Lieutenant Governor explained that he had only one eye and that it was so filled with dust that he was absolutely helpless, and he asked the policeman to help him into a drug store or get him to a physician.

"Is that so?" said the cop, sarcastically. "What's your racket, anyway?"

"I have no racket," replied the Lieutenant Governor, "but I do need a little help."

"What's your name?"

"Hanley."

"Where do you live?"

"Albany."

"What do you do?"

By this time Mr. Hanley was getting rather peeved, and he said: "I happen to be the Lieutenant Governor of this state."

"Oh, yeah!" said the cop.

Then Joe fished around in his pockets and finally produced a calling card, which he handed to the cop, whereupon that worthy apologized and helped him into a drug store, where the dust was removed.

On the invitation of Mayor Stanley Shaw of Ithaca, N. Y., who had declared a "Joe Hanley Day" in Ithaca, the Lieutenant Governor recently spent a very busy day here, and at the noon luncheon in his honor he told me those two stories, which I cite as an example of the humanness and simplicity of a truly great man, a public servant who for more than a quarter of a century has rendered statesman-like service to the people whom he represents. It's too bad that we don't have more public officers of his type.

At the luncheon, Lieutenant Governor Hanley spoke of the opportunities which in the past any American boy or girl has had to make good, no matter how lowly their origin. He said that the life of Alfred E. Smith, a truly great statesman and one of the best governors that New York State has ever had, was an outstanding example of what a boy could do in this Republic if he had the right stuff in him. Alfred E.

Smith, a poor boy, rose from the sidewalks of east-side New York to become Governor of the Empire State.

Joe himself is another example of a poor boy, who through his abilities and the opportunities which America offers rose to serve the people of his state for more than a quarter of a century. And there are literally thousands of similar examples in our history of men and women who have risen to positions of responsibility, success, and happiness through the opportunities made possible by freedom.

It is my hope, my prayer that these blessings of liberty which have cost our fathers so much and have meant so much to each succeeding generation of young people will not be destroyed by the present trend toward more and more government control more and more socialism, and more and more false security.—E. R. Eastman.

—A.A.—

THE "NEWER" ORGANIC INSECTICIDES

(Continued from Page 8)

Chlordane has also been used to some extent in agricultural control of grasshoppers and as a dust and bait for vegetable crop protection. The acute toxicity of chlordane is rated about one-half that of DDT.

Rotenone

Rotenone is one of the older insecticides of botanical origin, but it is still used today to some extent. It is chiefly used for control of Mexican bean beetles, to some extent pea aphids, ox warble on cattle and a few other uses. Rotenone is a quick and effective stomach and contact poison against such insects as thrips and certain caterpillars; it has a high safety factor in that it does not leave poison residue on treated plants.

Nicotine

Nicotine is another botanical insecticide which has been used for many years. It is still used as an aphicide to quite an extent in agricultural pest control work. Nicotine, of course, is poisonous in nature, approaching the poison range of TEPP. It, therefore, has to be used cautiously.

(Editor's Note: Parathion, one of the newest insecticides, is giving excellent results. However, it is very toxic to humans and must be handled with extreme care. Some of the precautions recommended are: (1) avoid inhaling the material when opening bags or dumping in spray tank; (2) work on windward side of the tank; (3) wear protective clothing, gloves, and a respirator. Parathion should not be handled with bare hands, and bare skin should not be exposed to it because it can be absorbed through the skin; (4) wash your hands thoroughly after you have handled the material and especially before eating or smoking. If the precautions recommended are followed carefully, there is no reason why you should fear using this material.)

—A.A.—

From the Superintendent of Documents, Government Printing Office, Washington 25, D. C., any *American Agriculturist* subscriber can get 9 booklets called "Spring Planting Pamphlets" for \$1.00. The bulletins cover the following subjects: Growing Annual Flowering Plants; Herbaceous Perennials; Roses for the Home; Hotbeds and Coldframes; Gardenia Culture; House Plants; Pointers on Making Good Lawns; Growing Vegetables in Town and City; Vegetable Gardener's Handbook on Insects and Diseases.

If you are interested in getting these pamphlets, send \$1.00 for "Spring Planting Pamphlets", Cat. No. SP-50, to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Putting Up Grass Silage

THERE ARE many possible methods of putting up grass silage, each with its advantages and with its disadvantages.

On many farms the first method of putting up grass silage was to use the dry hay-making equipment, namely, to cut it with a mower, rake with a side delivery rake, pitch it on the wagon by hand or use a hayloader, and then put it into the silo with an ensilage cutter.

The disadvantages of this method far outweigh the advantages. In fact, the only advantage was that no extra equipment was needed. There were repair bills because hay loaders were not designed to handle such heavy material. The big disadvantage, however, was that the material was heavy and the work was back-breaking even though some of the lifting was taken out of the job by ingenuity in lowering the ensilage cutter into a pit and by using various means of unloading the grass onto the ground.

A One-Man Job

At present a considerable proportion of the grass silage acreage is harvested in two ways—either with a field harvester or a field chopper. The field harvester cuts and chops in one operation. One of the advantages is that it is a one-man operation, and one man working alone can put up a considerable number of tons of grass silage. A disadvantage is that in spite of extreme care, stones are often picked up, either those lying in a field or those thrown up by woodchucks. To men who swear by the wilting method of putting up silage, there is a further disadvantage, that the grass has no opportunity to wilt because it is cut and chopped in one operation. Where a field harvester is used, the chopped material is blown into a wagon or truck and hauled to the silo where a blower elevates it into the silo.

In the case of the field chopper, the grass is first cut and either windrowed or raked and is then chopped in the field by a pick-up chopper.

In the conventional silo it is unnecessary to distribute or pack the grass as it goes in. Even with corn silage, less distributing and packing is done than used to be the custom. Nevertheless, if corn silage is not distributed and packed there is a tendency for

leaves to blow to the outside of the silo while the stalks and ears remain in the center, which results in uneven packing. This, of course, is not a problem in the case of grass.

We mentioned blowing of silage into the silo. There is some interest in trench silos. Some are of a temporary nature and others are quite permanent with concrete sides and a top which, in some cases, is removable. In these trench silos the cut grass is hauled in with dump trucks and packed by running a tractor over each load as it is brought in.—H. L. Cosline.

—A.A.—

GRASS SILAGE MAKES YELLOW MILK

NOTICING that Hayfield's milk from crossbred cows appeared in December 1949 and in January 1950 to be quite yellow even from cows carrying as much as $\frac{3}{8}$ Holstein blood, I wondered to what extent this factor was due to feeding grass silage.

I wrote Mr. Gaylord, Division Manager, Dairymen's League, Rochester, to ask if he would be kind enough to arrange to have samples of Hayfield's milk drawn from the weigh tank at the milk plant in Rochester on any day of his choice and on the same day draw samples of milk from some Guernsey herd not fed grass silage. Mr. Gaylord selected a herd fed corn silage, and that tests 4.7% as against the Hayfield's test of 4.4%. Properly refrigerated samples of the milk from each herd were delivered to Dr. Robert Holland, Department of Dairy Industry, Cornell, and on February 14 Dr. Holland reported the following:

Herd fed corn silage, 4.7% fat, 534 micrograms carotene per 100 grams of fat.

T. E. Milliman herd fed grass silage, 4.4% fat, 1,471 micrograms carotene per 100 grams of fat.

Yellow Color Helps Sales

In his letter, Dr. Holland stated: "Grass silage will always produce a milk with a much higher carotene content than will corn silage. You will note that our results are expressed in micrograms per 100 grams of fat. This can be readily converted to micrograms per quart by a simple calculation. There are 976.6 grams of milk in a quart."

Dr. C. B. Bender at Rutgers University last week stated in effect that higher carotene in milk produced on grass silage is well recognized and has been substantiated in many hundreds of analyses.

Apart from the extra health benefits of high carotene milk, the deeper yellow gives it heightened sales appeal. Grass silage makes an attractive, rich looking milk. In the case of the above samples it made the lower testing milk appear to be much the richer.

Greater use of grass silage should hold real value to milk companies in the highly competitive business of marketing fluid milk. Good for farmers, consumers, and milk retailers—that's grass silage. — T. E. Milliman, Ithaca, N. Y.

—A.A.—

PAINT THEM RED

Here's a hint for home gardeners: Those little tools to dig and weed with are likely to become lost because of their "protective coloration." Few of them come in other than dull colors. But, if their handles were bright colors, they'd catch your eye when you leave the flower or vegetable bed to go in for dinner. So—why not paint the handles red? Red just couldn't be missed against grass, ground or foliage.

—A. A. Staff Photo.

ROY WILLIAMS, whose farm in Middlesex in Yates County, N. Y., has been in his family for 150 years, is a firm believer in the principles of Americanism expressed in our recent Forum edition. He thinks government restrictions discourage business expansion. On his 330 acre farm, Roy is milking 15 head of cattle, has 1,000 chickens and keeps occupied in his 'spare' time with 8½ acres of grapes.

PAPEC 151D FORAGE HARVESTER WITH POWER TAKE-OFF

Many farmers have asked for a Papec Forage Harvester with power take-off. Now it is here—a standard Model 151D Harvester with power take-off assembly instead of an engine. Any 3-plow tractor will give this harvester maximum performance. If desired at any time, an engine can be substituted for the power take-off.

A Papec Forage Harvester is the easiest, fastest and cheapest way to handle hay and other forage crops. Eliminates all the heavy work. Can be quickly changed over from hay to row crops. Savings on twine alone frequently offset the extra investment.

Buy Model 151D for the average farm... Model 181 where maximum capacity is needed. See your Papec dealer or send us your name for FREE booklet describing these machines in detail.

PLANTING TIME IS PLANNING TIME . . .

DITHANE Has Earned A Place In Your Blight-Protection Plans

With DITHANE on hand you need no other fungicide. DITHANE sprays or dusts, used regularly *throughout the season*, stop potato blight before it starts!

DITHANE gives you *bonus bushels* too. For DITHANE's safety to foliage, vines and blossoms means potatoes of *finer quality and more of them*. In hundreds of side-by-side practical field comparisons, crops sprayed or dusted with DITHANE have outyielded crops treated with other fungicides—usually by 40 to 70 bushels per acre.

Thoroughly proved by thousands of farmers on thousands of acres of potatoes, tomatoes, celery, cantaloupe and other crops, DITHANE sprays and dusts are available from dealers throughout the country. See your dealer soon for your requirements.

WE GUARANTEE YOU'LL PICK THESE EVERBEARING STRAWBERRIES IN 90 DAYS

FAMOUS GEM EVERBEARING. Stern's takes the risk out of gardening. You'll pick these big juicy strawberries by August—or your money back! Every plant unconditionally guaranteed to bear—will start by July and continue bearing until freezing weather. Big, firm, round berries. Extra juicy, extra rich flavor, very sweet. Make mouth-watering short-cakes, pies, jam, irresistible with cream. Next year and after they'll bear earliest and continue right up to freezing time.

GEM EVERBEARING 50 for \$3.00 250 for \$12.00 1,000 for \$30.00
Selected highest quality Thick heavy roots

Thousands of feeders on thick fibrous roots. Stern's plants produce fast, heavy crops.

JUNE-BEARING VARIETIES—Guaranteed to grow and bear. Choose from these popular varieties:

PREMIER . CATSKILL . SPARKLE . FAIRFAX

50 for \$2.00, 100 for \$3.50, 250 for \$6.00, 1,000 for \$18.00 postpaid

FAMILY STRAWBERRY GARDEN—GROUP No. 30

An ample supply for the average family—for fresh fruit as well as for canning.

250 plants { 50 each of Gem, Catskill } only \$8.00 postpaid
Premier, Fairfax, Sparkle }

UNCONDITIONAL GUARANTEE—SATISFACTION OR YOUR MONEY BACK. Stern's guarantees these plants unconditionally for one full year. If, for any reason, you are not delighted with these quality products, purchase price will be refunded promptly. You need NOT return the plants.

DOUBLE-BARRELED SPRAYING

HOME-MADE, double - barreled spray guns are being used by F. C. Holbrook in his 80-acre apple orchard near Dummerston, Vt. The time-savers were built by his foreman, Kenneth Chamberlin, who is also Town Selectman and right handy with a welding outfit. Two men riding the spray rig tower are each equipped with one of the blunderbusses.

Formerly, each had to handle two separate guns. One was a multi-nozzled affair for wide spread; the other was a single-spray gun to reach a far limb or buck an adverse wind.

But juggling two high-pressure guns was no snap. It resulted in delay, or missing some limbs as the rig moved along. So Mr. Chamberlin dug into the spare-parts pile and welded a double-barreled job for each towerman. Lower barrel is a 6-nozzle gun converted into a 10-nozzle affair by adding two more at each end. Upper barrel has a single nozzle for distant or spot work. It handles 30-foot stretches. Each barrel is turned on or off by its own handle. In the picture, Mr. Holbrook, left, and Mr. Chamberlin examine one of the guns.

TEMPORARY SILOS - Are They Economical for the Long Pull ?

THE following letter and picture of a temporary silo, from Charles Bardo, Danbury, Connecticut, raise a question: "Is it economical to erect a 'temporary' silo when a man intends to go on using it, year after year?"

Mr. Bardo erected his 11 by 22-foot silo at very low cost because he got a lot of material free. But we notice that the paper to line the silo each year costs \$30. To this must be added the labor cost for putting the paper in, one tier at a time, as the silo is filled. In 30 years, which is not an unusually long life for a permanent silo, the lining cost, without labor, would be \$900. Of course he saves the interest on whatever amount he would have to invest in a permanent silo, but how long will the railroad ties and timbers and wire stand up?

Would it be more economical for Mr. Bardo to go on using this temporary silo year after year or take the plunge now and build a permanent silo? Read Mr. Bardo's description of his silo and then send your ideas to Jim Hall, *American Agriculturist*, Ithaca, N. Y.

Unusual Silo

FOR the past several years I have been a subscriber to your paper and have greatly enjoyed and benefited by many of your very instructive articles and ideas. Some time ago you ran several articles that were particularly interesting to me because the subject covered was temporary silos, and we have a most unusual one on our farm. Just recently we had some snapshots finished that were taken last fall, which show to pretty good effect its size and construction.

"I truly believe this to be the only one of its kind in the country. We live near a railroad and when they replaced the ties and timbers on a bridge at the border of our property we requested and received a large portion of the old ones.

"We dug a hole five feet deep and thirteen feet in diameter and placed the ties on end. Between every 5th or 6th one we placed a long timber to support the wire above the line of solid ties. The lower part is lined with tar paper and the

top is constructed of 1x2 turkey wire stapled to the timbers. We cemented the floor to prevent spoilage and also to hold the bottom of the ties firmly in place. Two cables with turn-buckles around the outside hold it from spreading.

"Actual inside measurements are about 11 ft. by 22 ft. The small silo pictured in the front is one we set up to hold our surplus as we had an unusually heavy stand of corn this past year. We have often set up this size out in the pasture for grass or oats silage for late summer feeding.

"The large silo has been in use now for 5 years and we have had very little spoilage. With the donation of the railroad ties and timber and two days' work for two men, its cost for wire, tar paper, nails, cable, etc., was about \$65.00. The cost each year for silo paper is about \$30.00. For our small operation of 15 to 18 head of Guernseys it has proven a very satisfactory arrangement.

"The 'men' in the snapshot are some of our 'potential' farmhands."

Charles Bardo, Danbury, Conn.

Discarded ties and timbers from a nearby railroad bridge gave Charles Bardo, Danbury, Conn., most of the material needed for the silo in the background.

Spring Lingers in the Lap of Winter

By L. B. SKEFFINGTON

SPRING is unusually late in Western New York. First plowing in various areas has averaged from 10 days to two weeks later. More snow fell in the six weeks prior to April 1 than all during the rest of the winter. Heavy snows and rains left many fields flooded. On the whole, the weather in the next three weeks was not the best for drying the land. On well-drained fields the absence of frost permitted a lot of water to seep in, but cold and occasional rains slowed things.

Up to mid-April, in talking with canners, I could learn of only two acres of peas planted. The other day I heard of one farmer who plowed in the morning and planted peas in the afternoon.

The same factors have delayed planting of oats. It now looks as if planting will go over into at least the first week in May.

Pastures have been slow to start, principally because of cold weather. There seems to be plenty of moisture in the ground and the condition of wells is much improved. Due to rapidity of the runoff in many sections, it is difficult to know whether ground water supplies have been replenished enough to avoid hauling water in coming months. * * *

Apple Men Organize

Lustiest youngster among farm organizations in the Western New York Apple Growers Association. It is an outgrowth of a questionnaire circulated at the winter meetings of the Horticultural Society. Nearly 80 per cent of growers answering favored such an organization.

Following several meetings of committees, a temporary organization was set up with Cameron Garman of Newfane as chairman. Lloyd Putnam, former Niagara County agent, has been engaged as executive secretary, beginning May 1. Purpose of the organization is to engage in promotion, advertising, gathering and distributing information; government contacts, etc.

Most interesting thing about the organization to date is the sign-up of members. In addition to a registration fee, growers sign a contract agreeing to pay one cent a bushel on apples packed for the fresh market, two cents a hundredweight on apples sold to processors, and one cent on apples sold for cider. To date, more than 1,000 growers have contracted to pay the assessments on an estimated volume of about five and one-half million bushels.

The newly organized Western New York Apple Growers' Association has named Lloyd A. Putnam, a native of Lyons and formerly Niagara County agricultural agent, as executive secretary.

The membership contracts call for deduction of the assessment by processors or storages. During recent years, about two-thirds of the crop has been going to processors. Attempts have been made to form a grower-processor organization. Many growers felt that the Apple Institute was primarily a fresh-market organization, and this has been a handicap. Tentative plans are that the new organization will collect all promotion funds on apples.

Milk Prices Displease

Class 1 milk prices were reduced 80 cents per 100 pounds in the Rochester and Buffalo markets April 1. Traditionally, each cut of 40 cents in the producer price has meant a reduction of one cent per quart in the retail price. In the Rochester area the retail price dropped only one cent, dealers explaining that the difference was absorbed in wage increases to drivers and plant workers. Reaction among producers is mixed. Many of them feel there is no point in voluntarily petitioning for or agreeing to lower prices if the cut is not to be passed on.

It is a sure thing that the producers' bargaining agencies will seek a price increase July 1, and it remains to be seen whether dealers will again raise prices. Many producers feel that the situation has proved the present method of fixing producer prices is unsatisfactory, and sentiment is expressed for formula pricing. * * *

Credit as a Tool

C. A. Arnold, federal production credit commissioner, made an inspection tour of Western New York last week and commented that the Northeast farmer is in a little better condition than farmers in other sections. He said land values did not rise as much here, that wartime profits were used to liquidate debts, and generally things looked fairly good. He admitted there were many "spotty" conditions as applying to areas and commodities.

First stop on the tour was Gannett Farms, West Henrietta, where a breakfast group included H. B. Munger, president of the Federal Land Bank of Springfield, and Warren Hawley, president of the State Farm Bureau Federation. After visiting several farms, Arnold spoke to the Batavia PCA in the evening.

Arnold advised farmers that "credit is a tool, to be used the same as any necessary implement on the farm. Credit is not something to spend, but something to make good use of." He said PCA's in the Northeast own all but \$950,000 of the peak government investment of five and one-quarter millions; that farmers have bought stock of \$4,500,000 and accumulated reserves of \$3,500,000. "This means," he said, "farmers have about eight millions in capital, and the government has a 10 per cent mortgage."

In reply to a question, Munger said there is "not a nickel" of government money invested in the Springfield Land Bank, or in any of the other 11 land banks.

DUTCH BOY FINDS AMERICAN JOB

Among classified advertisements in the January 21 issue there was one from Jacob Stelloo of Holland who wanted a job on an American farm. Jacob writes that he has had 31 replies. He is very appreciative of them, but finds that it is difficult for him to answer every letter.

He has accepted an offer and is waiting only for papers which are necessary before he can come to this country.

It's the Beginning of the Big "Blow" that may Flatten Many Dairy Marketing Programs

For months now, market-wise dairy farmers have been watching storm clouds gather on the horizon. They have heard the muttering thunder of price wars in distant cities. Some independent producers have been hit by the lightning of canceled dealer's contracts. Even cooperatives with one-dealer outlets have been forced to seek cover. And now comes the first force of the big winds . . . *the blow that may un-roof our price structures and flatten our markets!*

Everyone Knew It Was Coming

Reasons for the storm are easy to understand: First: increased production has been pouring record-making floods of surplus into the market. Second, uneconomic pricing of all commodities has reduced consumption, and has so pinched consumers that even where milk prices have been lowered, the pennies saved have gone to offset high taxes, rents or other costs, instead of buying more milk. Third, milk for manufacturing purposes has been priced at levels that do not take into account the sharp competition from production areas where processing costs are lower. Fourth, failure to give sufficient promotion to the use of dairy products.

League Members Are Secure, but Sympathetic

Fortunately for League members the sales outlets and the marketing and manufacturing resources built up over the years will insure the

sale of all League milk produced. But League members are always interested in and sympathetic to everything that concerns the industry. They remember the dark days of 1938. They know it isn't the actual size of the surplus, so much as it is the distress selling of unorganized and unprotected milk that causes the greatest damage to dairy farmers. That's why League farmers are working hard to find a real solution to the problem.

We Must SELL the Real Value of Milk and Milk Products

In New York State alone, population has increased two percentage points more than milk production has increased. That means a two percent greater market for milk that we are not selling. On the national scene, figures show that if everybody in America spent one-half cent more per day for milk and milk products, *there would be no milk surplus*. Remember, that is *everybody* in America—farmers and non-farmers alike. It means that if *your* family consumes an extra quart of milk, or an extra quarter-pound of cheese or butter, or even an extra dish of ice cream PER WEEK, and if everyone else does the same thing, the milk problem is licked. In short, we have got to do what the soft-drink makers, and the movie theatres, and the cigarette and liquor men do . . . and that is, we must advertise and sell our products to *more people*. All we have to sell is 4c more per week per person. That's not impossible, is it? Let's do it.

DAIRYMEN'S LEAGUE

Cooperative
ASSOCIATION, INC.

Former Soviet Farm Worker Compares American Farm Life

(The following letter to the editor, published in the NEW YORK TIMES November 9, 1949, is a firsthand account of the lot of a farm worker under Communism.)

I AM a displaced person from the Soviet Union. For three months I have been working on a farm in Pennsylvania as a manual worker. I would like to inform your readers how different the life in the United States is from that in the Soviet Union.

In the Soviet Union I was from 1934 to 1937 an agronomist at the large state farm "NI 7," near the town of Pavlograd. I know well the life of workers at such farms. This state farm had more than 1000 head of cattle and other livestock. There were more than 100 workers, all lodged in two rooms with one door, under one ceiling.

Each worker had a box for clothes and other personal things. Only clerks and old workers with families had a single separate room. As an agronomist, I had a separate room, with a berth, a table and a chair.

Potato and barley soup was the chief source of our nourishment. There were 600 milk cows on the farm and thus it had plenty of milk. But in spite of this the workers received only a pint of skimmed milk a day. Meat seldom was an ingredient of the soup and very few vegetables were used in it. No one made any effort to improve the workers' nutrition.

Lack of Facilities

The farm was close to the Soviet Union's largest power plant, that of Dneprogress, but the farm did not have electricity. It did not have a piped water supply and there were no sewage facilities. The farm had neither a bathhouse nor a bath. Three miles away there was a small bathhouse, open only on Saturdays. Men and women used it on alternate Saturdays.

Wages for workers on the farm varied between an average of 80 rubles a month, paid to milkmaids, and 120 rubles a month, paid to tractor drivers. (An ordinary suit cost 600 rubles). Half of the workers' wages went to pay for food.

Wages were paid one or two months after they were earned. All of the farm's products—cream, livestock and wheat—were sold. From the skimmed milk casein was made for glue. The workers were able to take very little of these products. Only a few of the officials could take as much of the products as they needed.

Near the farm was the shop where usually only whiskey and imitation coffee were for sale. If cloth should appear in the shop, it was assigned to a worker by the manager.

The farm had no club or other place of entertainment. No cinema ever was shown. Trade union meetings were held often, to improve labor discipline. The farm had no library, not even newspapers.

Not infrequently the NKVD was there, in spite of the fact that the farm had a political section representative, a party secretary and a trade union secretary, whose work differed very little from that of the NKVD.

From specialists such as agronomists and engineers more was demanded than from unskilled workers. Therefore, it was dinned into me, I was obliged to strain every nerve to make an intense effort. The agronomist would be the first to be held responsible for a failure. In such a situation, it was very difficult to carry out even the simplest tasks, and nerves became worn with the fear that one might be

(Continued on Page 18)

"It's Handy"

DOUBLE DOOR FOR CORNER

When kitchen cabinets form a right angle in a corner of the room, the shelf space at the corner ordinarily is obstructed by an upright post to which doors are hinged. The construction detail shown here, as taken from

American Builder magazine, eliminates the post and enables the corner space to be used conveniently. The double-hinged door opens fully, exposing the entire shelf area. Structural support is provided by horizontal braces under the shelves and the counter top. — A.A. —

REMOVING STUMPS

After cutting down a tree in your yard, in preference of going to the labor of digging the stump out, cut the top and bottom out of a metal barrel, place it over the stump, start a bonfire in the barrel, put on approximately a bushel of soft coal, let burn for about eight hours and your stump will be gone. — Esther Grant, LeRoy, N. Y. — A.A. —

LAND SMOOTHER

For a handy substitute for a float or land roller I use 3 heavy iron wagon tires about 3 inches wide. I bolted them together and fastened a hitch on one of them.

I have a small farm and have to watch expenses. I use this tool to cover grain which is broadcast by hand and to smooth the land. — Richard Livermore, Lisle, N. Y. — A.A. —

A PIPE-GATE

Here's what I made a couple of. I hope you can understand the drawing below which is a "Pipe-Gate."

I used ¾" Gal. pipe for the gate and 1½" pipe for it to slide through. Any old pipe is good enough for the sta-

tionary pieces, but I found that a new ¾" pipe is best for the sliding part.

The ¾ inch material consists of: 3 pipes 12 feet; 2 pipes 12 inches; 1 tee and 2 L's.

Then I used three larger pipes about ten feet long fastened to the fenceposts by band iron straps, the same distance apart that the gate pipes are so the

pipe gate slides freely through the big pipes when desiring to open the gate. Of course the pipe sliding bars can be any length the gap happens to be. The gate is wind-proof and may be opened part way as desired and stock cannot get it open. Also, snow does not block it in any way. When the gate is closed, the end rests between two posts with a board nailed across the bottom of the posts on which the gate sits.

I call it a telescope pipe gate as that explains it best. — Frank Waters, R.D. No. 3, Kingston, N. Y. — A.A. —

EMERGENCY POWER

When there is a power failure or mechanical trouble with my milking machine pump I use my tractor for vacuum. I had a ¼" hole tapped into the intake manifold on my tractor and installed a stall cock. I ran a hose from it to a stall cock that I installed between pump and vacuum tank. It handles the job nicely. I also have a six-volt bulb and cord which I attach on to the battery cables. — Barney Budynski, Waterport, N. Y. — A.A. —

REPAIRS LADDER RUNG

Here is a sketch of a simple way to repair a broken rung on a ladder without the necessity of taking the ladder apart. First saw the broken rung so it

fits flush inside the rails. Then cut two blocks six inches long and as wide as the rails. Then bore a hole in each block large enough for the new rung, drive the blocks on to the rung, drive the blocks between the rails at the proper place, and nail securely to the rails. The rung is now as strong as when new. — I. W. Dickerson. — A.A. —

SALT BLOCKS

To keep the salt blocks from melting on the ground or being chewed by horses and cattle, drill a hole through and string the blocks on a wire and hang them to a low limb of a tree or to a fence post. This will allow the blocks to swing, and cattle will have to lick them instead of chewing and wasting them. — Kenneth Gabrosek, Fly Creek, N. Y. — A.A. —

When I get through using a paint brush I wash it out with gasoline or kerosene. I then work vaseline into the bristles and lay the brush away. It never gets hard and I don't need a can of oil to soak it in. When I want to use it again, I wipe out the vaseline and it is ready to use. — Kenneth Huling, Hampton, Conn. — A.A. —

Have any of you ever had trouble putting on the new plastic milk hose? I find they are very small, but by putting the end of the hose in hot water and holding it there for a minute or so it will soften enough to go on, thus saving much time. — John Davison, East Worcester, N. Y.

ROTO BALING

**seals in
the leaves**
**seals out
the rain**

Your ROTO-BALER rolls the windrow into a bale with leaves wrapped inside, protected from rain.

To feed it, you simply unroll a bale down the feedway . . . and there you have the hay just as it was in the field. The soft leafiness, the color and protein are still there.

With your own Roto-Baler, you're ready to go the hour your hay is cured. You can breathe easy when your crop is in rolled bales, for they shed rain like a thatched roof. Rolled bales store compactly, will not buckle; may be unrolled or fed whole in the open feedrack.

Pitchfork labor is no more when you Roto-Bale your hay or straw. The ONE-MAN ROTO-BALER is priced for home ownership. It's years ahead. It's Allis-Chalmers!

The POWER DRIVEN A-C Rake steers true, makes ideal wide windrows for Roto-Baling.

(Below) The new Allis-Chalmers Bale Loader picks up bales lying at any angle.

ALLIS-CHALMERS

AGAINST PRICE SUPPORTS

I appreciate the effort you are making to awaken the public to the dangers of price supports.

As potato farmers, we have never felt it honest to accept support. The whole program has been leading towards socialism and depriving the American farmer of his sense of independence and true freedom.

The very qualities of character which have made our country great are being stifled under centralized government controls. Let us be free Americans once more—not government wards!—E. M., Wayland, N. Y.

AVOIDING PLUGGED BLOWER PIPES

I notice that you have an article on making silage in the current issue of *American Agriculturist*. It brings up the subject of getting your blower pipe plugged when blowing silage into the silo.

Two years ago we had quite a bit of trouble with this. Last year we followed this procedure and had no trouble. I am not 100% sure whether this was the reason that we had no more trouble, but anyway here it is:

We decided that the silo became plugged because grass and juice were deposited on the inside of the blower pipe and this became fermented and sticky if allowed to stay in the pipe overnight. Therefore last year each day, when we finished blowing in grass silage, we threw two bags of cracked corn into the blower and let it blow up through the pipe and into the silo. Cracked corn is quite sharp and it makes quite a noise when it tears up through the pipe, and I feel that it does a pretty good job of cleaning out the pipe so there isn't much juice and grass deposited on the sides of the pipe overnight.

Some people, I understand, have used sand for doing this, but when you use sand you have got to turn the top of your stack out into the outdoors and put the sand out into the air, whereas using cracked corn we just let it blow into the silo and of course the cattle don't mind some nice yellow corn in their grass silage.

Last year we did not let the grass wilt. We just cut it and ran the pick-up chopper over it, blew it in the silo, and threw some ground oats into the blower too, and this helped as a preservative and gave us very nice silage.—Monroe C. Babcock, Ithaca, N. Y.

FROM THE SUNNY SOUTH

I am writing to you from Cana, N. C., where the people have no snow, and barley and oats sown in September and October can be pastured for green feed for milk in February.

You can drive a distance of two miles and see more than a dozen log tobacco houses where tobacco is flue-dried by a fire, and also see many wells, some 30 feet and some nearly 100 feet deep and not a pump in the whole lot.

I found out what it is to live in a log house. Some of them have the appearance of having been built during the colonial days.

Perhaps 85% of the houses here are on stone or cement corners, no cellars and no boards to keep the wind from under the house, and only a few of the newest houses in this country are frame houses and very few, if any,

with a full cellar under the house.

One farmer near here is building a barn 110 by 40 feet, with pen stables on each side and hay storage in the center. All the frame is whole trees, not sawed, set on the ground and braced. Rafters are not sawed either. The people building it told me the cost was less than \$500.00, but the barn had no sides yet and not quite all the roof.

My home is in Fredonia, Chautauqua County, New York, but I am spending an indefinite time here with some relatives.—E. T., Cana, N. C.

NO SHOOTING!

I think farmers could get much better prices for their milk and cream if they would advertise a little more. My husband likes to listen to the news broadcast which comes just about mealtime. When we turn on the radio, what do we get just before our meals, even breakfast? Wine and beer. Every time I hear it I think what a wonderful spot for a milk program. Most families would hear it and it would help the children and grown-ups, too, to drink it.

It shouldn't cost too much to have a recording made. Let them tell a funny story about drinking milk and being healthy. Let it be funny or silly, but please—no shooting!

I'm so sick and tired of most of those radio programs with their killers and bad men. I wonder if anyone does listen to them. I think our Health Department should sponsor a program on milk. It could help, who knows, maybe to prevent cancer, bad heart, and many other ills. I'd love to see it tried!

—L.B.S., Macedon, N. Y.

—A.A.—

FORMER SOVIET FARM WORKER COMPARES AMERICAN FARM LIFE

(Continued from Page 16)

condemned as an "enemy of the people."

After many years of being a displaced person, I find myself on a farm in Pennsylvania. The owner gives me a very beautiful modern apartment. I receive \$100 a month, and vegetables and eggs in addition. I spend less than half my pay in living expenses, and I eat my fill of food of my choice.

Can you imagine how low are the workers' living conditions in the Soviet Union? And for such a pitiful, miserable existence the worker must live in perpetual fear of the dictatorship and the NKVD. In the Soviet Union both my wife and I worked, she as a teacher and I as an agronomist. We lived in continual want. Together we earned 1,000 rubles, but during a whole month we could not save 100 rubles for clothing.

In addition to all this, I am a free man. I can read what I want. I can write to friends what I really mean to say and I know that for this I cannot be put in prison.

I am grateful to the Government and people of the United States for permitting me, a former DP refugee from the Soviet Union, to live and work in this free democratic country. — Nicolas Nessim, Washington Crossing, Pa.

—A.A.—

In U. S. there are more than 2,500 acres of vegetables grown under glass. The initial cost of constructing a greenhouse and supplying heat is approximately \$55,000 an acre. The largest vegetable hothouse is the J. W. Davis gardens of Terre Haute, Indiana, with 55 acres under glass.

Say you saw it in AMERICAN AGRICULTURIST

By J. F. ("Doc") ROBERTS

HAVE you confidence in government farm support prices? Have you been watching support prices on hogs? That is a lesson, a warning, an almost unbelievable situation.

About a year ago, after long, expensive deliberation, the government came out with a complicated series of hog support prices varying with the month, the location of the hogs, and the weight and kind of hogs to be sold. Some two months ago, with a heavy supply, hog prices began approaching these support prices.

Many farmers had studied these price changes on the markets as compared to government promises and had arranged their hog breeding and marketing with support prices as a base. Then about three weeks ago in some markets, hogs began selling below their support prices. It was then reported that support prices were only supposed to apply on the average sale price for a complete week at any given point or market.

About two weeks ago hogs began selling everywhere for less than support prices every day. Believe it or not, the government then threw its promises out the window. It claimed it was off any hog support; it had no money to support hogs; it didn't see how it could be done under its setup even if it did have the money, and, therefore, everyone was on his own — farmers,

packers, retailers, consumers and all. Free enterprise would have to rule the hog market.

Did everything go to pieces? It did not! Packers became more active buyers; the hog market price stopped going down and has since seemed to stabilize itself. It is now showing daily variations in price with supply and demand, and every hog raiser, packer and consumer seems happier and to have greater confidence in the hog and pork industry.

So again (and this has happened before on hogs) we see the sorry picture of government unreliability, and the heartening sight of the people tackling their own problems with greater confidence once the government is out. There is a real reason for this. In spite of the fact that lard "on sale" in Buffalo is selling at retail for as low as 8 cents a pound with live hogs selling at 16 cents, the fear of government piling up a lot of products to keep the market depressed over a long period is gone.

We Americans feel that we can take care of ourselves if the government will leave us alone. This is particularly true of pork products because so much of the hog has to be processed for future sale. If the fear of government "dumping" is removed, then confidence in the future arises no matter what the present price may be.

I am wondering if this really doesn't apply to every farm product raised, since everything the farmer produces is for a future market. Remove his confidence in that future by having prices dependent upon an unreliable government and we have the present deplorable situation in all agriculture and farm marketing, which should

(Continued on Page 23)

Getting That Extra 10% Raising Dairy Heifers

(Continued from Page 1)

green color: Such hay is high in feeding value, vitamins, protein, and minerals as well as palatability. A mixture of grasses and legumes or even a straight legume such as clover or alfalfa is satisfactory but quality is more important than variety. Calves should have free access to calf hay in racks and should be encouraged to eat large amounts starting the second week of age. Always give the younger calves the choicest hay available.

Older Heifers Often Neglected

Liberal feeding of high quality forage at all times is needed to keep heifers growing rapidly and at the same time keep costs at a minimum. Three to six pounds of concentrates will be needed during the barn feeding period to keep yearling heifers in good growing condition unless the roughage

is of exceptional quality.

Calves and heifers are most often neglected and underfed during the pasture season. This is because young animals are turned out to pasture at too young an age and usually on too poor a pasture. Calves may well be started on pasture at five or six months of age, but the pasture should be near the barn where supplementary hay and some grain can be fed. Calves should not be expected to depend entirely on pasture before they are ten months of age.

Yearling heifers will make satisfactory growth on good pasture, but the pasture must be really good. That back pasture of poverty grass, thorn brush and weeds is not enough. It takes just as good a pasture to keep heifers growing rapidly as it does to keep cows milking. Seeded pastures of legumes and grasses, legume aftermath, sudan grass, or supplementary feeding of hay and silage in racks may be used. If pasture does get short in mid-summer, some supplementary grain may be needed.

Needless to say, heifers should have free access to salt and water at all times. It is also a good idea to give them free access to a simple mineral mixture as follows:

- 50 lbs. iodized salt
- 50 lbs. steamed bonemeal
- ½ oz. cobalt sulfate

Heifers that are well grown can be bred to freshen at 24 to 26 months of age. Breed Holstein and Brown Swiss when they weigh 750 pounds, Ayrshires at 600 pounds, Guernseys at 550 pounds, and Jerseys at 500 pounds.

It costs more to grow heifers well, but the returns in higher production per cow, longer productive life, and higher sales value will mean a larger net profit.

If you have mastitis in your herd use this famous drug

AUREOMYCIN OINTMENT For Udder Infusion Lederle, world famous as the antibiotic with the broadest activity in human medicine, is setting new records in cutting down milk check losses from mastitis.

This remarkable drug has proved its effectiveness against staphylococcal and streptococcal mastitis. Thousands of dairy herd owners are enthusiastic about the quick results in the production of salable milk, and the ease of administration

You will find a tube of AUREOMYCIN OINTMENT

- MORE EFFECTIVE THAN PENICILLIN
- FREE-FLOWING AND SPREADING THROUGHOUT THE UDDER
- ACTIVE FOR MORE THAN 48 HOURS
- WILL NOT INTERFERE WITH REGULAR MILKING HOURS
- COMBINES SAFETY WITH EFFECTIVENESS WHEN USED IN ACCORDANCE WITH PACKAGE LITERATURE
- PACKAGED, READY TO USE
- WITH SMALL, ROLLED-IN INFUSION TIP
- REQUIRES NO SYRINGE OR MILK TUBES

When obvious injuries to the udder or teat occur, it is advisable to apply this ointment locally to the wound and at the same time to infuse each quarter so affected with one full tube of AUREOMYCIN OINTMENT for Udder Infusion as a preventive measure against mastitic infections.

For maximum efficiency in the use of AUREOMYCIN OINTMENT and best management practices and disease-control procedure for avoidance of reinfection, consult your veterinarian.

Help Your Bewildered Started Pullets

By L. E. Weaver

A MAN whose real name is not Mr. B. Ginner, but who actually is a beginner, moved 500 twelve-week-old pullets to new quarters recently. Next morning he found 135 of them piled up dead from suffocation. That sort of tragedy has been going on for years. Experienced poultrymen don't often let it happen because they have learned (usually by the hard way as with Mr. Ginner) how to prevent it and are on the spot at the critical time when the pullets are settling down for the night. Unfortunately, when we have written or talked in the past about the benefits of separating cockerels from pullets, or of moving part of an all-pullet flock to other quarters in order to give all of them more room, we usually have not also warned of the danger of piling when started chicks of any age are moved to quarters not familiar to them.

When dusk begins to close in, instinct seems to tell the youngsters to seek cover against the dangers of the approaching night, so each one tries to snuggle under some of the others. Wherever a few cluster together and form a small group, others quickly gather around and soon there is a mass of milling pullets that is slowly worked to a corner of the room, if it didn't originate there. The ones at the bottom (naturally the biggest and strongest that could crowd in the hardest) are overwhelmed and trapped by the weight of the mob above. Death comes quickly by suffocation.

How to Prevent Trouble

What to do? There are a number of effective procedures. Teach them to roost before you move them. That may be all the preventive action needed—provided of course that there are low roosts in the new quarters. Provide some heat in the room if it is cold, but do not make the mistake of thinking that chicks crowd together and pile

up only when they are cold. Just plain bewilderment and fear will make them crowd. Perhaps it's a sort of homesickness; a feeling of insecurity in a strange place; possibly a longing for the sense of safety and comfort that goes with familiar surroundings. Eight weeks is the age at which we usually can allow the brooder fire to go out, but in winter 10 or even 12 weeks of heat may be necessary while in summer 6 weeks may be sufficient.

Provide a dim light sufficient to let the chicks see the roosts but not enough to keep them feeding. Bright, all-night lights will probably do the trick, but are not advisable for other reasons.

Be sure that the litter is dry. Some people think that wet litter is one of the prime causes of piling up.

Above all else be sure to be there yourself the first two or three nights, or as many nights as necessary to teach them to go on the roost, or settle down in a layer only one chick deep. You will have to keep breaking up the larger groups as they form and keep picking up pullets and setting them on the roost until it gets so dark they stay put, and abandon their determined efforts at suicide.

NO ROOSTS

ONE OF the questions most frequently asked at extension meetings this winter has been "How is the no-roost plan working out?" Because I have yet to be on a poultry farm where the plan is being tried, I just sidestep the issue by asking if anyone present has tried it, and if they are willing to report their experiences.

At a recent meeting with about sixty present, two men reported; both were against the plan. The first man's comment was to the effect that if you have a good egg washer probably no roosts would be all right, but since he cleans his eggs dry by hand he had to go back to roosts because he was getting three or four times more dirty eggs.

The other man said that in a very large room such as he had, you might expect the hens to be spread about all over the place at night, but instead of that they insisted on settling down in one big mass at one end of the room, and always in the same spot. The result was that the floor at that end of the room was disgustingly wet and dirty. He too has gone back to roosts.

On the other side of the question I have had a few conversational reports that the plan is working out satisfactorily. I am wondering therefore if some unreported special or extra management practice must be employed to make the plan succeed. Perhaps some of you readers who have tried the "no roost" plan will be willing to write me your conclusions to date, to be passed along for the benefit of other readers. Of course we want both the pros and cons.

— A. A. —

PRODUCTION TO PAY FEED COST

R. C. Baker of the Poultry Department of the New York State College of Agriculture reminds us of a rough formula which can be used to figure the egg production necessary to pay feed costs.

Divide the price you pay for 100 pounds of feed by the price you get for a dozen of eggs. Multiply by 3 if you have Leghorns and 3.6 if you have

(Continued from Opposite Page)

heavy birds. The result is the percentage of egg production necessary to pay feed costs. In arriving at the price per hundred of feed, you can, if you do not know the proportion of grain and mash eaten, assume that the flock eats equal amounts and take a simple average of your mash cost and grain cost.

Let's see how it works! Suppose your feed costs you \$4.00 a hundred and you are lucky enough to get 40 cents for your eggs. Divide the \$4.00 by 40 cents and you get 10. 10 x 3 shows that with Leghorns you will need 30% production to pay for feed; multiplying by 3.6 shows you need 36% production if you are raising heavy birds.

— A.A. —

GIVE CHICKS ENOUGH GROWING ROOM

The matter of space for growing chicks is very important. The commercial poultryman realizes this, but the backyard enthusiast may overlook it.

Assuming that you have space enough for day-old chicks, the space will be inadequate unless you remove the roosters when they are around six weeks old. Each eight-week-old pullet should have not less than one square foot of floor space; and, unless they have access to outdoors, they will need two feet.

— A.A. —

COAL HOD FOR GRAIN

Here's an idea that has saved me time and grain. When filling the feed hoppers for my chickens, I use a coal hod to pour the grain into the hopper. The nose of the hod fits nicely into the hopper, and no grain is spilled on the floor. Also, I can fill the hopper much quicker this way. — Mrs. Andrew J. Smith, Groton, Vt.

— A.A. —

LAWN-CLIPPING SILAGE

Two years ago I put up in a steel molasses drum the clippings from my lawn. I cut the top from the drum with a chisel around the edge or rim and then ground the rough edge off the top on an emery wheel so it dropped into the drum easily.

Then I mixed 4 gallons of stock molasses with 4 gallons of water, and when I dumped the lawn clippings into the drum I sprinkled the molasses mixture on the clippings with a common garden sprinkler, stirring so that all the clippings were moist or had a touch of the molasses. I leveled it off each time and placed the top on with a stone as heavy as I could lift. It was surprising how it settled without spoiling. I started feeding it to the hens right away and there was no spoilage when I finished feeding the drumful in late fall.

I plan to put up several drums of grass silage this summer as I keep 500 laying hens and they are crazy for it. — W. M. Nopper, Forestville, N.Y.

3 reasons why you should buy SUNNYBROOK

BABY CHICKS

1 If we could place in your hand right now, one of our 1950 Sunnybrook Baby Chicks, you would say at first glance, "there is the finest baby chick I have seen." They have that certain something we find difficult to say in cold type—a bubbling over robust health, a lusty peep, sharp clear eyes, fine body structure, strong legs. Last of all — they stand so erect, so proud. Well, why shouldn't they? They are from the leading production strains in America and they bear the most outstanding name for Quality in the Poultry World — SUNNYBROOK. You will be amazed at our astonishingly low prices.

STARTED PULLETS

2 are the answer to those of you who have delayed until now to buy your baby chicks. We have them 4-6-8-12-16 weeks old up to ready-to-lay. That means they were last Nov., Dec., Jan. or Feb. baby chicks. So you see, you have not lost a day. They are priced so low, we believe they will cost you less than if you had raised them yourself. We have them in all the popular breeds, ready for immediate delivery.

STARTED CAPONS

3 More and more Poultrymen are going into Capons each year—many in addition to their regular baby chicks and started pullets. They stagger the three groups so as to level off their income over a 12 month period. Noted for their fine flavor and texture of flesh. Sunnybrook Capons are delicious and always bring high premium prices, no matter what the poultry market may be. We have some dandies and at a price everybody can easily afford to pay and make money on them.

From U. S. Approved-Pullorum Clean Breeders—of Course.

Wherever you live—you are a neighbor of Sunnybrook. By Parcel Post, Railway Express, by Air or by our own fleet of trucks, we get them to you safe and sound — 100% alive, we guarantee.

DOWN THE ALLEY

(Continued from Page 19)

have been anticipated. Remove powerful government from our market places (and this means from foreign market places as well as our own) and you replace the confidence on which our country was built.

We all recognize there are problems of surpluses, imports, exports, tariffs, currency devaluation, and the general price level, but if we can keep government and politics out of our market places, most farm problems will disappear.

— A. A. —

JERSEY CATTLE BREEDERS PLAN SHOW

Herbert E. Kinney, East Greenbush, N. Y., was elected President of the Capitol District Jersey Cattle Club at their fourth annual dinner meeting in East Durham, N. Y. He succeeds Andrew E. Danish, who declined to run for a third term. Re-elected were: Irving L. Mosher, Vice President; Mrs. Gleason A. White, Secretary and Treasurer; Ira G. Payne, C. H. Jennings and Stanley N. Chittenden, directors.

Plans have been made for a Parish Show to be held at Moordenier Hills, East Schodack, N. Y., Mr. Ira G. Payne's farm, on June 10. The show will be open to all Capitol District Jersey Cattle Club members as well as 4-H club boys and girls in the Capitol District. Trophy cups and ribbons will be awarded. Judging will be done by Otto J. Schaefer.

— A. A. —

GUERNSEY COW SETS HIGH RECORD

A registered Guernsey cow, Klondike Faith, owned by J. M. McDonald, McDonald Farms, Cortland, N. Y., has completed an outstanding Advanced Register record of 13,655 pounds of milk and 701 pounds of butterfat in the 365C day division, starting her record as a 5-year old. This record was supervised by Cornell University.

Klondike Hollifaith is the daughter of the registered Guernsey sire, Klondike Hollimost.

Sew Now for Summer

By
GRACE
WATKINS
HUCKETT

SIMPLICITY and wearability are the keynote to Summer fashions! Instead of radical changes, the big news comes at the top of the silhouette—cropped sleeves cut in one with the bodice, scooped-out necklines, sun-backs. With this trend toward greater simplicity you can be certain that the clothes you make this year will serve for next year, too.

Sheers are the Summer stars. You'll see them in every type fashion from blouses to sun-backs and in a broad assortment of fabrics. Outstanding are the varieties of printed and plain voiles, satin striped and plaid sheers, nylons, semi-sheers such as batiste and cotton georgette.

No. 3024 teams a smooth-fitting sun-dress, back pleated, with flyaway bolero. This is the double-duty ensemble—and is easy to make!

No. 3023 is the basque sun-dress and flare-back bolero duo—on a smaller scale.

Simplicity-smart dress No. 3011 will see you 'round the clock. Softly tucked, it uses a touch of scallops as its only accent.

A scene-stealer, whether made as a study in contrast or in one material—No. 2074 features the new portrait neckline.

No. 2066 is the two-way costume again, this time a cap sleeve charmer with bolero jacket

that buttons below wing revers. Pointed pockets on the dress repeat lines of the shoulder yoke treatment.

Pinafore type dresses are both pretty and practical. No. 2109 has the added attractions of cool sun-back styling, crisp ruffles, hip pockets.

For daughter, too, the pinafore sun-dress is a perfect choice. No. 2110 duplicates mother's style—down to the rustling ruffles.

Summer's casual story is smartly told by No. 2176 which has new looking revers and one large pocket. Shoulder buttoning provides easy exit.

All ages love sun sets! No. 2516 is especially for the little miss—a princess sun-back with its own panties and shoulder-covering bolero.

Dainty tucked dress for daughter—two versions. Make No. 2051 with full puffed sleeves or with airy armhole ruffles—and panties to match.

For something different in front-button styling—No. 2165. Its panel-yoke is new, slenderizing. Its back pleat insures walking ease.

No. 2175 is a younger edition of the eye-catching panel and yoke dress.

Here is one of the season's easiest-to-wear and easiest-to-make washables. No. 2122 has a slightly scooped neck and rippling cap sleeves—plus a pair of pockets that are hand-handy.

PATTERN SIZES AND REQUIREMENTS

- 3023—6-14; size 8, dress and bolero, 2½ yards 35-inch.
3024—12-20; 36-40; size 16, dress and bolero, 4½ yards 35-inch.
3011—12-20; 36-48; size 18, 4½ yds. 35-in. or 3½ yds. 39-in.
2074—10-20; 36-40; size 16, 3½ yds. 35-in. with 3 yds. 35-in. contrasting; or, in one material, 6½ yds. 35-in.
2066—10-20; 36-40; size 16, dress and bolero, 5½ yards 35-in.
2109—12-20; 36-42; size 18, 4½ yards 35-inch.
2110—2-10; size 4, 1½ yards 35-inch.
2176—12-20; 36-44; size 18, 4½ yards 35-inch.
2516—2-8; size 4, dress and panties, 2 yards 35-inch; bolero, ½ yard 35-inch.
2051—6 mos., 1, 2, 3. Size 2, with puff sleeves, 2 yards 35-inch; with armhole ruffles, 1½ yards 35-inch; panties, ½ yard 35-inch.
2175—6-14; size 8; 2½ yards 35-inch.
2165—12-20; 36-46; size 18, 4½ yards 35-inch.
2122—12-20; 36-42; size 18, 4 yards 35-inch.

TO ORDER THESE PATTERNS—Write name, address, pattern number and size clearly. Enclose 20 cents for each pattern wanted. Add 20 cents for our new Summer Fashion Book which has pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

Happy Endings

By RUBY PRICE WEEKS

NOTHING is more delicious at the end of a meal than a good dessert. Fruit either alone or in combination with crackers and cheese is always good. But one doesn't always want the same thing and occasionally craves more filling desserts, particularly if a meal isn't too hearty. Here are recipes for more filling ones when you feel the urge to try something different:

BELLEVUE PUDDING

1 cup molasses
1 cup sweet milk
1/4 cup butter, melted
1/2 teaspoon cloves

2 cups flour, sifted before measuring
1 teaspoon soda
1 teaspoon cinnamon

Sift all dry ingredients together. Add molasses, milk and butter. Pour into well-oiled mold and steam two hours. Serve with your favorite sauce.

GSGOOD PIE

1 cup sugar
Yolk 3 eggs
2 tablespoons vinegar
1/2 teaspoon cinnamon
1/4 teaspoon cloves

1 tablespoon melted butter
3/4 cup raisins
3/4 cup pecans
3 egg whites, beaten stiff
Pastry

Mix all together but egg whites, which are folded in last. Bake ten minutes in pastry-lined tin at 450° F., then for about 50 minutes more at 350° F. Bake till a knife, inserted, comes out clean. Serve plain or with whipped cream. It is very rich—hence pass the cream in a bowl.

RICE PUDDING

1 cup soft boiled rice
2 cups milk
1 cup sugar

1 lemon
3 eggs, separated
1 tablespoon butter
1 cup raisins

Beat egg yolks well and put into milk. Add rice, sugar (all but 6 tablespoons which must be saved for the meringue), grated lemon rind and raisins. Pour into well-oiled baking dish. Cover with meringue made by beating the egg whites to a froth, then slowly adding the sugar and lemon juice. Spread over the pudding and bake at 300° F. until brown.

APPLE CRISP

3 cups chopped apples, unpared
1/2 cup dark corn syrup
1/4 cup hot water

1/4 cup butter
1/2 cup brown sugar
1 cup rolled oats
1/4 cup flour
1 teaspoon salt

Place apples in a well-oiled baking dish. Combine corn syrup and hot water and pour over apples. Mix butter, brown sugar, rolled oats, flour and salt until they are a crumbly mixture. Sprinkle evenly over tops of apples. Bake at 350° F. for about an hour or until delicately browned.

SPICED COFFEE PIE

This "Spiced Coffee Pie" is very different and delicious:

1/4 cups cornflakes
2 tablespoons sugar

CRUST
1/2 teaspoon cinnamon
1/2 cup melted butter

Combine crushed cornflakes, sugar, cinnamon and fat. Reserve 1/4 cup mixture to sprinkle over top. Spread remainder evenly in a 9-inch tin. Pat down firmly and chill thoroughly.

PIE FILLING

2 teaspoons unflavored gelatin
2 tablespoons cold water
2 eggs
3/4 cup sugar

3/4 teaspoon cinnamon
1/4 teaspoon cloves
1/2 cup milk
3/4 cup strong coffee
1/2 teaspoon salt

Soften gelatin in cold water. Separate egg yolks from whites. Beat yolks and add 1/2 cup sugar, salt, spices, milk and coffee. Cook slowly stirring con-

stantly until mixture is slightly thickened and coats the spoon. Remove from heat. Add softened gelatin and stir until dissolved. Chill until mixture begins to thicken. Beat egg whites until stiff but not dry. Add remaining sugar gradually to whites, beating after each addition. Fold into gelatin mixture and pour into chilled pie shell. Decorate top with reserved crumb mixture and chill in refrigerator.

GRAHAM CRACKER CRUST LEMON PIE

Another filling and delicious dessert is Lemon Pie with Graham Cracker crust:

FILLING
1 1/3 cups sweetened condensed milk
1/2 cup lemon juice
Grated rind of 1 lemon

2 eggs
4 tablespoons granulated sugar
Baked pie shell

Blend together the condensed milk, lemon juice, grated lemon rind and egg yolks. Pour into baked pie shell—cover with meringue made by beating whites until stiff and adding sugar gradually. Bake in moderate oven 350° F. until brown. Chill before serving.

CRUST

1 1/2 cups crushed graham cracker crumbs
1/2 cup sugar
1/2 cup melted butter

Mix all together well and press firmly into a 9-inch pie plate. Chill until set, about 45 minutes. (If chilled well, it may be baked at the same time as the meringue.) Should you wish to use this crust for a gelatin chiffon pie which does not need any baking, bake the shell for 15 minutes at 375° F. Add filling after chilling crust.

BANANA WHIP

6 medium sized peeled bananas
6 tablespoons sugar
1 tablespoon lemon juice

1/2 cup walnut meats, broken
4 egg whites
1/4 teaspoon salt

Put bananas through a sieve. Beat the sugar, lemon juice and nuts into them. Whip egg whites till stiff and fold lightly into banana mixture. Pour into a baking dish from which it may be served and bake in a 325° F. oven for 30 minutes. Serve either hot or cold with cream or a soft boiled custard.

THE ZERO hour approaches as far as the supply of fruits and vegetables in the freezer is concerned. The favorites likely have reached the vanishing point, while some of those that require thought and time in preparation are still there to be coped with. Connecticut's Extension Nutritionist has come up with the following good suggestions for using some of those items:

Frozen Blueberries: To a one-egg cake batter, add two teaspoons grated lemon rind and two cups of frozen blueberries which have been dusted with flour. The unsweetened berries and berries frozen in sugar are better for use in cake than blueberries frozen in sirup. Bake this cake in a moderate oven (350° F.) for 35 to 45 minutes. Serve it a la mode or with a lemon sauce.

Peach Crumble utilizes canned or frozen peaches for an easy dessert. Arrange a quantity of sliced peaches in a buttered baking dish. Sprinkle with 1/4 cup peach liquid to which 1 teaspoon lemon juice has been added. Blend together 1/2 cup flour; 1/2 cup brown sugar and 1/2 teaspoon salt. Cut in 2 tablespoons butter until the crumble mixture is the consistency of corn meal. Sprinkle mixture over the peaches. Bake in a moderately hot oven (375° F.) for about 20 minutes or until

(Continued on Page 26)

Rutland Grandmother Wins Prize at County Fair

Winning cooking prizes is getting to be an old story to Mrs. Sara Sheridan of Rutland, Vermont. She has carried off many awards over the years for her entries at the Rutland Fair, one of the most popular county fairs in New England. Mrs. Sheridan says that it takes practice to be a prize-winning cook. "But," she adds, "it also takes the very finest ingredients. When you bake at home, for instance, be very careful about the kind of yeast you use. I, myself, wouldn't use any but Fleischmann's. It's good and lively. Year in and year out, it gives me best results."

Right! Prize-winning cooks prefer Fleischmann's Yeast to all others.

DELICIOUS, FLUFFY Muffins!

•No need to risk costly ingredients...no need to disappoint your family in the treat you promised! For here is your secret of delicious homemade muffins that are light as a feather every time...

Double-acting Davis gives double protection. Batter rises in your mixing bowl...then again in your oven.

"Now I Can SLEEP"

"Coffee nerves used to keep me tossing and turning. But since switching to POSTUM, I sleep soundly—and friends have commented on my improved appearance."

SCIENTIFIC FACTS: Both coffee and tea contain caffeine—a drug—a nerve stimulant. So, while many people can drink coffee or tea without ill-effect—others suffer nervousness, indigestion, sleepless nights. But POSTUM contains no caffeine—nothing that can possibly keep you awake!

MAKE THIS TEST: Buy INSTANT POSTUM today—then drink POSTUM exclusively for 30 days—and judge by results!... INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

RED-WINGED BLACKBIRD

By Edith Shaw Butler

Now the red-winged blackbird sings
From marshes where the cat-tails grow.
He perches on a rush and swings
Above his plain brown mate below.
He bows and spreads those red tipped wings,
In admiration she looks on
And listens to his carolings,
A small but wifely paragon.
She feels warm eggs beneath her wings,
He perches on a rush and sings.

"—NO MORE UPSET STOMACH"

Do you suffer heartburn after meals?...feel lousy?...uncomfortable? Then read this heartening letter from a woman who found her way to better digestion and better health:

"Before switching to POSTUM, I suffered both indigestion and nervousness... But now my nerves are quieted and my digestion much improved. No more upset stomach after drinking POSTUM!"

SCIENTIFIC FACTS: Both coffee and tea contain caffeine, and caffeine is a drug which in many persons tends to produce harmful stomach acidity, as well as nervousness and sleepless nights. So while many people can drink coffee or tea without ill-effect, others can't—and this may mean YOU!

MAKE THIS TEST: Give up coffee—give up tea—drink POSTUM exclusively for 30 days—and judge by results! Remember: POSTUM contains no caffeine or other drug—nothing that can possibly cause indigestion, nervousness, sleeplessness! Ask your grocer today for INSTANT POSTUM—A Vigorous Drink made from Healthful Wheat and Bran. A Product of General Foods.

The Trout Season is here!

The average fisherman is a good sport. He respects the other fellows' property and does not make a nuisance of himself. But there are some who do not live up to that standard. You know the type. They make it bad for everybody.

If you are annoyed with that element

Post Your Farm

and have the law on your side. You can always permit the desirable sportsmen to fish.

Our "No Trespassing" signs are printed on heavy fabric (12"x12") that will withstand wind and weather.

Happy Is The Day When Backache Goes Away

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

When writing to advertisers be sure to mention AMERICAN AGRICULTURIST.

Sally Saves

Spring Housecleaning

THE THINGS most of us dislike about spring cleaning are the messy little jobs like sorting clothes, mending screens, and cleaning cupboards. Here are some shortcuts used by Sally Saves' readers:

Lillian Smith, R. D. 3, New Berlin, N. Y., offers this suggestion for removing black from kettles: "Mix equal parts of earth and wood ashes or coal ashes in a shallow wooden box and sprinkle with water. Holding kettle firmly in both hands, rotate it back and forth in the mixture."

* * *

Alice Carter, R. D. 3, Poor's Mills, Belfast, Me., cleans burned and stained agate pans by filling them with water, with a tablespoon of bleach water added, and bringing the mixture to a boil. Mrs. Carter contributes another idea, good at any time but especially applicable to housecleaning time when all manner of lost items, some unidentifiable at the time, are turned up. She suggests marking a small box "Lost and Found" and using it for buttons, screws and other things found from time to time around the house.

* * *

Jeanne Hall, Gannon Place, Star Route, Hudson, N. Y., keeps a tube of liquid solder handy when cleaning screens and uses it to mend small holes in them.

* * *

Mrs. Jobie E. Farlee, R. D. 1, Lambertville, N. J., makes soap-filled scouring pads go further by cutting them into at least six pieces (use old scissors). She can then discard a piece before it rusts, and not feel wasteful about it.

* * *

When she paints window frames, Mrs. Clinton R. Wilfer, R. D. 2, Fillmore, N. Y., first applies a narrow strip of vaseline to the pane. It catches splattered paint and is easy to remove.

* * *

Mrs. Orpha Brown, Gilboa, N. Y., literally puts on the heat when she finds a moth hole in the rug. She covers the spot with a damp towel, then irons it dry with a hot iron. The steam and heat kill moth worms and eggs.

— A. A. —

PROPER CARE OF YOUR FINE BLANKETS

TAKE CARE and store your beautiful all-wool blankets and you will have them for many years to come. It is important to launder them or have them cleaned before putting them away for the summer.

If laundering them in your washing machine, run one blanket at a time for one minute only. Stop machine, raise entire blanket and place in different position, then run machine one more minute! That's all—just two one minute washings, timed by the clock!

After washing, squeeze the water from the blankets by hand, do not twist. Rinse thoroughly twice — one minute each — in soft water. Be sure that the water is never warmer than your elbow can stand.

Hang blankets over the line lengthwise and pull gently into shape. When partly dry, reverse it on the line, lengthwise always.

When dry, brush blanket with a soft clothes brush. Brushing fluffs up the nap so it insulates more effectively and provides greater warmth. Also brush between washings; it removes dust and dirt. Brush gently toward the binding, never across the blanket.

When storing blankets, be sure that they are placed in a cool, dry place, preferably in a sealed container. If you have a special blanket box, be sure it

SELFISHNESS IS A BAD TRAIT!

IF THERE were just two suckers in your house and three children, what would your small daughter do about the situation, do you think? A picture is often worth 10,000 words, so look at this one showing three children and two suckers. Betty, at the left, is gobbling her sucker rapidly, but Regina, at the right, is considering hers seriously. She is just as eager to eat it as Betty was hers, but she has been taught to think of others. So without

a doubt she will either give her sucker to little Jean, or divide it with her.

Children who from infancy are taught to do unto others as they would be done by, are pretty likely to adhere to that rule as they grow older. Selfishness is a very bad trait and parents should make every effort to keep their children free from showing it or feeling selfish, or doing things that show they think of themselves instead of others.—Louise Price Bell.

SPOTLIGHT ON HOME BUREAUS—Apr. 30-May 6

IN 56,000 rural communities throughout the nation this week, 3,000,000 Home Bureau members are joining in celebrating National Home Demonstration Week. The event is being marked by festivals, meetings, tours, demonstrations and exhibits designed to show Home Bureau accomplishments in '49.

From a small beginning in 1913, home demonstration work has grown to where it takes in every interest of the home and community. Today a homemaker can get help in home management, food production and preservation, planning of nutritious meals, home furnishings, use of equipment and of color in the home, crafts, clothing the family, family relationships, child training, consumer buying, family and community health, and even a better understanding of national and international affairs.

A big factor in the success of the Home Bureau program is the work of volunteer local leaders who get special training from the experts and then pass on what they learn to other women in their communities. A half million of these local leaders will be honored this week by Federal, State, and county extension workers.

FREEZER FACTS AND FANCIES

(Continued from Page 25)

the top is bubbling. Serves 6.

Instead of Frozen Green Beans "as is," combine them with two vegetables of any flavor. Or try adding a cup of diced celery to each quart of green beans. For vegetable casserole, place the vegetables in dish, cover with milk, season, and sprinkle with crumbs on top. Bake in moderate oven 30 to 45 minutes.

To glorify Frozen Cauliflower, broccoli, or asparagus, serve with cheese sauce. Simply stir in 4 tablespoons grated sharp cheese to each cup of medium white sauce. Cook and stir until the cheese is melted and the sauce smooth. Pour sauce over cooked vegetable just before serving.

PANSY APRON Pattern No. E-221 is beautiful in design and easy to make in filet crochet. The apron is about 21 inches long and 21 inches wide. Enclose 15 cents in coins and ask for complete instructions for this lovely apron. Add 15 cents for our new needlework book which includes 11 free patterns and illustrated instructions for slip covers, besides a large selection of designs in crochet, knit and embroider. Address Embroidery Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y.

Take a Walk

By RUTH H. ENCK

HOW LONG is it since you have taken a walk around your own place? We farm women live in the most beautiful sections of the country, yet we often fail to enjoy that beauty because we are so busy with all the household tasks that farm living entails. But a kitchen will take on new interest if it is forgotten once in a while. Walking out of doors for even 15 minutes will refresh one's mind, body, and spirit.

Are there days when all the cares of the world seem to rest on your shoulders? This is the time to leave your four walls and walk alone in the pine woods. God is there. Talk with Him and come home with a lighter heart.

Do the children seem unmanageable? Take them for a walk along the brook. They will see trout darting through the water, suckers lying on the bottom, and crayfish scuttling under rocks. In early spring they may find frog's eggs to bring home and hatch. In summer they can wade and sail boats. Even in winter a brook is a pleasant thing as it gurgles beneath its coat of ice, and along its snowy edge there are bound to be animal tracks that tell an interesting story.

I like to remember a day in April when our whole family walked to the upper pasture where trailing arbutus

grows in a thick carpet. We knelt often to inhale its delicate fragrance, and picked a few pink clusters to bring home. Then we followed an old cart path above the blackberry patch and through a poplar grove, past a tiny spring, and out into the clover field. Two deer, surprised at their grazing, lifted white flags and disappeared into the oak woods. We sat down on a log, Dad produced a package from his pocket, and we munched cheese sandwiches while enjoying a view of the distant Catskills. Coming across the lower pasture, Dad and the boys leaped the brook successfully, but I got my feet wet. The children found fat red checkerberries, and we ate our fill before coming to the house.

For a short walk we often climb the ravine above the spring house. In May there are trilliums and violets, in October we gather witch hazel for a last autumn bouquet.

No matter where you walk or how often you go, nothing is ever twice the same. Over night the columbines have started or there is a fresh deer track. In every corner of the farm, things are happening. Plan to take a walk soon for the good of your soul. It has been said that the divine in any of us comes to the surface as we walk.

TODAY IN Aunt Janet's Garden

Grow Some Perennials

PERENNIALS are the backbone of the flower garden, and, once established, they are there and ready to bloom before we can get the annuals transplanted.

Many perennials are easily grown from seed and might as well be sown

in the vegetable garden, thinned, and transplanted in the garden, and set out in the border either next fall or next spring. I would nominate some perennials as belonging to an easily-maintained group — not being too fussy about soil and water requirements and being fairly disease-resistant. Of course, I put the daylily at the top of the list in these respects, but it takes about 3 years to get a flowering plant from seed. In the following list of perennials I am including only those which ordinarily bloom the next year:

Achillea (yarrow), variety Ptarmica, is a white cluster-flowered perennial blooming in mid-summer when flowers are scarce; is of medium height and blends well in the border. Anthemis also blooms when flowers are scarce—is a yellow daisy-like flower of medium height, is perfectly hardy and may be had in golden yellow or pale yellow (moonlight). This plant seeds itself freely; plant it and you'll always have it!

Aquilegia or columbine is available in short or long-spurred varieties and in most beautiful colors. It really should be regarded as a tri-ennial, although I have had plants persist for years.

The hardy alyssum, basket-of-gold or the lighter yellow varieties, grows from seeds freely enough. However, because of its single tap root, it is better to plant it where it is to remain, instead of transplanting. I have plants that are 15 years old—on the upper ledge of the rock-garden, and therefore well drained.

Cleome or spider-plant is another that can be sown where it is to stay. If you have a corner where the planting can remain undisturbed for some years, other than for fertilizing and weeding, such a colony makes a good show. In rich soil the plants grow 3 or 4 feet high and can be used as a screen planting.

Another good screen which I have used is the perennial sunflower, Heliothis, which grows about 4 feet high. It has 2-inch yellow flowers with black centers, good for cutting.

In some groups, women organize a plant exchange—in this way getting a greater variety than each could grow for herself. A woman who grows her own plants never begrudges what she pays the plantsman, for she knows what goes into producing a good plant!

SEW and SAVE

JUST OUT! The SUMMER FASHION BOOK! Fresh new fashions for warm days ahead, with emphasis on smart simplicity that makes for easy sewing. Over 150 practical pattern designs for every age and every occasion. The prettiest clothes for vacation charm; compact but versatile weekend ensembles.

Frocks to make of the new summer sheers; or the gay, splashy cotton prints; of crease-resistant linens; of all the cottons that tub and tub.

With the help of this book you can plan for your summer needs for town and country, desk to date, stay-at-home and go-to-market; for youngsters' play togs, party pretties. A bridal dress, and styles for the wedding guests. In fact, the most complete collection you'll find in any pattern book.

Send for your copy now. Price, 20c. Order from AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

THE YOUTH'S COMPANION

Bill Gates and The Schooner "Belle Queen"

By JOHN R. SPEARS

FOREWORD

In Chautauqua County, New York, a century or so ago, Billy Gates, known as the stupidest boy in town, yearned desperately to become a sailor. In the story on this page John Spears tells how Billy achieved his ambition and became Captain William H. Gates, one of the leading citizens of the town of Sheridan.

BOSTON, THURSDAY, JUNE 7, 1891

hours as he could get when not at his work in walking up and down the beach, searching for boards to use in making the boat, while every stray nail and screw that he picked up was secreted in a corner of a manger in the barn.

At last on a rainy day, having obtained enough boards to build three rowboats, if the boards had been of the right sort, he took the old buck-saw, the axe, and his knife to the barn, and began work.

The model chosen was that of a scow, but one considerably narrower at what he intended should be the bow than at the other end. He had two planks suitable for the side walls, and having cut the ends somewhat into the shape of a sled-runner, he put them on edge, and began to nail boards upon them to form the bottom and the ends.

Some of the boards were thicker than others, and some were warped. In sawing them to the required length, he was unable to cut them either square across or at the angle to fit the sides of the boat. Some of the nails were so large as to split the ends of the boards.

However, he did not see the defects, and as the form of the boat grew his interest in it increased, till his blood bounded through his veins.

His awakening was rude, but unusual in the respect that he did not feel the whip that his father had used to bring it about. As he was fitting the last board in its place, he glanced up and saw both his father and mother standing near by, and looking at him. The tears were in his mother's eyes, while

his father's face was twitching as if he, too, were affected by some strong emotion.

Bill simply put down the axe with which he was about to drive a nail, and turning his head in his dull, heavy way toward the lake, which could be seen through the open doors of the barn, gazed silently over the water.

No wonder the mother cried, and the lines in the father's face worked nervously. The father was now quite sure that his oldest boy was really a fool, and the mother, whose heart was tortured because of her boy's trouble, could find no words or arguments to alter that conclusion.

As the boy dropped the axe, the father said, sternly, "Go into the house—no, stay where you are! Mother, go and tell Captain Lanphere to come here, where he can see that thing. Whatever made him think our Bill could be a sailor, or anything else, is more than I know."

The boy flushed violently, and began to stammer, "Don't, father! Please let me go in—"

Then he stopped. He had been proud of his boat, but now that Captain Jerry Lanphere, who lived up the road and commanded a schooner that sailed on the lakes—a real schooner, as the boy had said to himself,—now that Captain Lanphere was to see it, the ill-shapen model, the cracks between the bottom boards, the hacked ends of these boards, the utter absurdity of the craft by way of comparison was very apparent to the poor lad.

But the father was inflexible, and the

boy, in hopeless misery, stopped talking.

After a brief time Captain Lanphere entered the barn.

"Hello, Bill! How are you?" said the captain.

Bill turned around with a shamefaced smile, and said:

"Ye-es, Sir."

"Been building a boat, eh?"

The boy's face flamed up, but he turned away his head without a word.

"Why", continued the captain, in a burly voice, "you needn't act like a school-girl over the thing! 'Tisn't much of a boat, but you tried to make one, didn't you? Why, my wife was telling me this morning about your whittling at boats all the time. She said you were counted just as much of a fool as ever, too."

"Somehow I'd never heard about the boats. When she said you were always making them, spite of the whippings your father gave you, I told her you weren't so much of a fool as folks thought. I used to make boats myself, and got whipped for it, too. How'd you like to go sailing?"

Go sailing! The boy could not for a time believe he heard aright. Ever since he could remember anything he had dreamed about going on the lakes as a sailor. Not that he had ever really thought he could go; it would have been the height of presumption in him, after what every one had said to him about being a fool, to think it possible that he could do the work of a sailor.

But now here was Captain Jerry Lanphere, the real master of a real schooner, asking him how he would like to go sailing!

Next morning Captain Jerry's hired man drove the Captain and Bill to Dunkirk, and by ten o'clock Bill was on the deck of the schooner Belle Queen, lying at the lumber docks in Buffalo Creek, with everything ready to pass a line to a tug that soon came along to tow her into the lake. Before twelve o'clock Bill was at last afloat on the great freshwater sea.

It was late in the month of May, and the Belle Queen had made one round trip to Saginaw and back for lumber, and was bound up again on the same charter.

How the boy found himself in a new life; how he, as it seemed to him, worked his way through a mental fog that had shut him in; how he was at first ignorant, but not awkward, about the deck; how he was kicked and cuffed for his ignorance by the mate of the schooner; how he was never kicked or cuffed twice for the same mistake, because he never needed to be told a thing more than once; and how he very soon won the approval of even the men in the fore-castle by his eagerness to learn and to do everything that was to be learned and done about the little vessel, need not be told.

By the time the Belle Queen had sailed through the rivers and was fairly afloat on Lake Huron, Bill Gates was able to do handy work on mainsail and topsail, and was even made to take his turn at the wheel in ordinary weather.

For twelve months thereafter Bill never left the schooner. He was invited to go up to Sheridan once, when the Belle Queen was in Buffalo and Captain Lanphere was going; but something, he could not have told what, held the boy

(Continued on Opposite Page)

SLIM AND SPUD

End of a Beautiful Friendship

Then he would squat on his heels and throw pebbles or bits of dirt into the water, or set sticks afloat upon it. The fact that his father might be at work near by, and was sure to resent this idleness, did not make the slightest difference.

At the school which he attended regularly when it was in session, he did but little better than in the field, save only in two studies. He was a good pupil in arithmetic, and could commonly tell more about what was in the geography than his teachers could. In all other studies he was a failure.

There was a self-appointed task that he never wearied of, and that was whittling toy boats. The number of ill-shaped hulls that were launched on lake and brook it would be impossible to enumerate. To call them ill-shaped does not convey a good idea of what they were like. His conceptions of what a ship was like under water were very vague.

Nevertheless, when he was sixteen years old Bill determined to build a row-boat. He said nothing about his intention to his parents. He occupied such

New York State Grange Lecturers' Schools in Progress

MRS. FLORENCE PICKETT, State Lecturer of the New York State Grange, is currently conducting four schools for Subordinate and Pomona Lecturers. Subjects covered at the two-day schools are Grange policies and principles, discussion methods and techniques, handling local publicity, building the Grange Youth program, Rural Life Sunday, music and recreation, and the lecturers' opportunities and plans for handling the Grange's 1950 farm practice, the project on birdsfoot trefoil.

These subjects will be discussed under the leadership of Mrs. Pickett, State Grange Master Sherwood, Professors R. C. Clark and William Reeder of the Extension Service, Harry L. Graham and E. Payson Smith of the State Grange, Mrs. Gertrude Corfman of the Dairymen's League, the Reverend Stanley Skinner of the Rural Church Institute, and a representative of the Agronomy Extension staff to handle the evening classes on developing the Grange birdsfoot trefoil program.

Schools have already been held at Ithaca and Canisteo. The next will be at the Gouverneur Grange Hall May 9-10, and the final school will be at the Newtonville Methodist Church, four miles north of Albany, May 12-13.

In support of the Grange Birdsfoot Trefoil Project, a comprehensive "Notebook of Ideas" is being distributed to the Lecturers at these schools. In addition to the program suggestions, the notebook contains an *American Agriculturist* one-act Prize Play (comedy) on Birdsfoot Trefoil, several excellent articles on Birdsfoot and a list of reference material that is available through the cooperation of the *American Agriculturist*, Rural Radio, the State Extension Service and the Department of Agronomy at Cornell.

— A.A. —

HILL GATES AND THE SCHOONER "BELLE QUEEN"

(Continued from Opposite Page)

back. Yet during all these months there was not a day when he was not homesick, and half ready to cry from a desire to see his mother and the weather-beaten old farm-house, with its back yard running down to the pebbly beach of the Lake.

Bill had gone away from home leaving behind neighbors, and his own father, who believed that he was not bright mentally. Now he would not go back until he had in some way shown himself a sailor, or had at least finished out the season "man fashion."

* * *

The opportunity to show his qualities as a seaman came unexpectedly.

It was during the last week in October. The Belle Queen had cleared the Detroit River, bound for Buffalo after a very successful trip to Saginaw for lumber, and was again in the familiar waters of Lake Erie.

Here she hauled to the wind until well past Point Pelee, and then, as the wind canted to the east, stood off still further into the lake, intending to come about after a little, and go booming on her course to Buffalo.

It was between nine and ten o'clock at night when Captain Lamphere put her about. The wind meantime had freshened, and the air was full of heavy mist which drove along in clouds, now thickening until nothing could be seen a vessel's length away, now thinning till the horizon seemed almost a mile from the vessel, but never for a moment leaving the air clear.

It was a "dirty night," and the Captain was somewhat nervous over it. Finding the rain increasing, he stepped

into the cabin for his oilskins, leaving the second mate in the starboard waist, and Bill at the wheel.

Hardly had he left the deck when the lookout on the fore-castle shouted:

"White light on the starboard bow."

"Hard a-starboard," shouted the second mate.

"Red light on the starboard bow," continued the lookout instantly. "Red and green lights under white light."

"Port! Port!" yelled the mate. "Port your helm!"

But it was too late.

(To be continued)

— A.A. —

FARM YOUTH EXCHANGE VISITS

Ranging in age from 18 to 25 years, 41 American farm boys and girls who are participants in the International Farm Youth Exchange Project will spend the summer on farms in 15 European countries. A number of young people from other countries will also come to America.

Six of the young people are from the Northeast and they are: Donald Cole

Andrews, Topsfield, Mass.; Barbara Annie Bean, Florence, Mass.; John Thomas Breakell, Goshen, Conn.; Elaine Catherine Serfass, Palmerton, Penna.; Burton Byington Strong, Craftsbury Common, Vt., and Pauline Joyce Wescott, East Poultney, Vt.

This is the third year that these visits have been made. The purpose is to give young people first-hand knowledge of farm people in other countries. It has been frequently said with much truth that the difference between neighbors in the same community or in the same world disappear when they understand each other.

FELLOWSHIP AWARD WINNERS

Richard Warner of Ithaca, N. Y., whose home state is Maryland, is one of the seven Ralston Purina Research Fellowship Award winners. Mr. Warner's specialty is dairy husbandry. These fellowships are annual awards made on the basis of merit without regard to the fact that the applicant may have been a previous winner.

The committee which picked the winners was made up of Dr. W. M. Beeson, Purdue University; Dr. R. M. Bethke, Ohio Agricultural Experiment Station; Dean C. A. Elvehjem, Wisconsin University; Dr. M. A. Emmerson, Iowa State College, and Dr. K. L.

CHORE TIME

By Inez George Gridley

The milker's steady hoosh-a-hoosh,
The motor's faithful purr,
Flow on each morning and each night
Around the calendar.

Chewing her placid, rhythmic cud
A cow is unaware
Of any scampering chipmunk thought
Or clinging burdock care.

The white-washed stable walls are thick
For each man's breathing space,
How good to start and end each day
Here in this peaceful place!

Turk, Cornell University. All the winners, according to the committee, are well qualified to continue in research projects.

Richard Davis of Durham, New Hampshire, is an alternate for the Fellowship in Dairy Husbandry.

— A.A. —

FIRE PREVENTION CONTEST WINNERS

For 13 years the New York State Central Organization of Co-operative Fire Insurance Companies at Albany has conducted a fire prevention contest for young people. It starts with county contests in which each contestant must inspect from 10 to 50 buildings, locate fire hazards and then return to see if they have been corrected.

This year's winners are: (1) Jane Jackson, McGraw, N. Y., and John Caswell, Canton, N. Y.; (2) Jane Snow, Cazenovia, N. Y., and George Grace, Elmira, N. Y.

A year ago New York had 2 national winners who went to Salt Lake City to receive their awards.

— A.A. —

DRINK MORE MILK

Milk provides the body with minerals and vitamins so important to proper health, growth and development. It's hard to get enough calcium—so essential for good bones and teeth—without a regular supply of milk or milk products. Milk is by far the best source of calcium and riboflavin. In addition, milk contains mineral phosphorus, vitamin A, some vitamin D, thiamine, fat and sugar. Milk products also provide first-rate protein for body tissues building and repair.

Nutritionists recommend 2½ to 3 glasses (8 oz.) of milk per day per adult and 3 to 4 glasses per day for children. Manufactured dairy products are a satisfactory source for a substantial portion of these requirements.

You can assure your own and your family's requirements of milk:

1. By using more for breakfast, as a beverage, by cooking cereal with milk instead of water, by serving milktoast, French toast.

2. By serving milk and its products with between meal snacks.

3. By using milk and dairy products generously on lunch and dinner menus, in casseroles, meat and fish loaves, and in the many creamed dishes. Milk improves many soups and is basic, of course, in numerous dessert dishes.

—Elizabeth E. Ellis

A Low Cost Pond

ON THE Walter Brandes farm in Allegany County, N. Y., there is a multi-purpose spring-fed pond that cost slightly more than \$450. It supplies water for spraying, livestock, fire protection, wildlife protection and irrigation, and is a recreational area for the farm family. Built in the summer of 1946, it had paid for itself in farm operations by the end of 1947. It is about seven-tenths acre in surface area, has a depth of about 8 feet over a third of the area, and was built with equipment owned and operated by the Allegany County Soil Conservation District as part of Mr. Brandes' complete farm conservation plan.

With a D-7 caterpillar tractor with hydraulically operated angle dozer blades, a towing winch, sheeps-foot rollers and some wire netting for staking down emergency spillways, the pond was built in approximately two weeks. About 2,500 cubic yards of earth were moved, and a drain and special pipes for filling spray equipment and carrying stock water were installed. The site was just below a pasture spring, and within a month the pond was full, holding in excess of 800,000 gallons of water.

Mr. Brandes does a thorough job in farm cost accounting. His 1946 records show a saving of 4 hours on each spraying of potatoes. When he needed water, he did not have to go three miles into the valley and then haul the water back up a steep hill. There were nine sprayings that summer, making a total saving of 36 hours work. Figured conservatively, the time—involving Mr. Brandes, a hired man, and operator and a tractor—was valued at \$4 per hour during July and August, a total saving of \$144 in spraying potatoes that season. It freed men and machines to do other vital work when there was

hay to be put up, grain to be harvested and crops to be cultivated.

These savings on potato spraying in 1946, '47 and '48, plus the \$250 received under the ACP program as a farm pond construction payment, represented \$682 in cash money to offset the \$450 cash expenditure for the pond. In addition, Mr. Brandes received other returns in stock water and recreation services and fish for the family table. The pond was fertilized and stocked with fingerling brook trout in May 1947, and in midsummer, 1948, Mr. Brandes was catching 12 and 13-inch trout.

The pond area has been fenced and planted to grass, shrubs and trees to produce a picnic area where, on a summer Sunday afternoon, you can usually find three or four neighboring families having a grand time.

— A.A. —

FARM PONDS REQUIRE MANAGEMENT

In the USDA Soil Conservation Service Pamphlet P. A. 65, 1948, information is given on how to "Manage Farm Ponds for Bass and Bluegills." A fertilized pond, the authorities point out, may produce five times as many pounds of fish as an unfertilized pond. Instructions call for fertilization every two weeks during warm weather until the water becomes so clouded with microscopic plants that the bottom in 12 inches of water cannot be seen. Fertilization, once started, must be done regularly. The recommendation is 100 lbs. of 8-8-4 or 8-8-8 fertilizer per acre. Four other analyses carrying smaller amounts of nitrogen are recommended with special applications of ammonium sulfate or ammonium nitrate to make up for the lack of nitrogen.

Kernels, Screenings and Chaff

By H. E. BABCOCK

THE LAST four or five years I have spent all of my spare time and some of my own funds trying to sell the leadership of this country on the importance of a broadly based and vigorously supported program to improve the nation's meals.

Refrigerator Meals

Because I felt pretty sure that most people who take an active interest in better eating get themselves all bogged down in the details of a proper diet, I have tried to popularize the twin ideas that the foods we like best are best for us.

We find these "best for us" foods in the ordinary home refrigerator. They are relatively fragile and spoil easily (which is what helps make them digestible) and therefore have to be stored at low temperatures.

It is easy for us to eat the foods which come out of the refrigerator. They are the butter for our bread, our steaks and roasts—the source of the meat gravy for our potatoes, the cream for our coffee, and the eggs to make a really good cake or omelet. In short, they are the milk, meat, eggs, fruits and vegetables on which the normal American housewife likes to base her meals to be sure they are nutritious, digestible, and that the menfolks will like them.

Production Handicap

Milk, meat and eggs are converted foods. They are the products of feeding inedible grass and forage, waste fruits and vegetables, cereals not needed for human consumption and their by-products to food-producing poultry and livestock. But for several years much of the feed for livestock and poultry has been arbitrarily priced rather high by the government, and as a result the number of these converters has not kept pace with the human population. Consequently, we have had a comparatively low production per capita of milk, meat and eggs, and retail prices for these products which have tended to choke off consumption.

Situation Changing

Now this situation is changing and all of us have to pay the price of past mistakes.

While there is no great increase in the production of milk, meat and eggs, the retail prices at which they are sold are definitely limiting the sale of these products and, just as important, these wonderful foods are up against the most aggressive competition this country has ever seen for the wage earner's dollar. Surpluses of milk, some poultry products and some meats are beginning to pile up. Until the situation gets really desperate, the conditions governing the production of these foods are such that generally the retail prices for them will not reflect their over-supply. As a result, consumers will not improve their diets by using more of these foods.

At the same time, much of the feed from which milk, meat and eggs are made is in government hands and priced so high that producers are caught in a terrific squeeze. The worst example is the great stock of cottonseed owned by the government which will be released presently to make oleo-

FARM NOTES

Last fall I reported on a test of the comparative grazing values of winter barley and rye here at Sunnygables. You may recall that we sowed these two crops in late August and watered and fertilized them with a sprinkler irrigation system.

Our purpose was to extend last fall's grazing, which we did quite successfully, and to get early spring grazing. The latter idea is not working quite so well because of the very cold and unseasonable weather we have had this spring. Often we have been able to turn our cows out on either rye or improved pastures by the first of April. From the way things look now (on April 20), we will be lucky if we have good grazing by May 1.

But coming back to the comparative grazing qualities of winter barley and rye. Much to our surprise last fall, the cows frequently left the barley to graze rye. Also, as the fall progressed, the rye put out more pasturage than did the barley. This spring there are spots where the winter barley has completely killed out, and it looks yellow in comparison with the dark green and heavier growth of the rye.

Based on one year's rather sketchy experience, we can see no reasons for using winter barley over rye for late fall and early spring grazing. The winter barley we tried was the "Wong" variety. Nuff said.

GRAZING ALFALFA

If the weather ever warms up enough so that grass will begin to grow, we are going to throw an electric fence around a few acres of an old established stand of alfalfa and brome grass and try grazing it.

Mr. A. C. Muller of Pawling, N. Y., suggested the idea to us. For a number of seasons he has successfully followed the practice of grazing alfalfa in the spring. He says that the cows like the grass better than the alfalfa and eat it back first, thus giving the alfalfa a better chance. Checking on these observations I note that the brome grass in our stand is out ahead of the alfalfa today, and I think it will be very good if we can check its growth. We've had troubles with it in seasons past because it grew so high and rank that it was difficult to harvest.

In this year's seedings we have substituted orchard grass for brome on a couple of fields, and I can see we may be headed for trouble which might be controlled partially by grazing back the orchard grass in the spring, if we find that our cows do the same sort of job Mr. Muller reports his do.

SWEET CLOVER

Several creeks and a couple of dry brooks converge at Sunnygables. One of the creeks and one dry brook now discharge their spring floods on our flats with terrific force, principally because the State Park Commission keeps the channels of these streams above us cleared out, thereby hastening the flow of water through them. Under the circumstances, it has seemed wise not to spend any money trying to keep the creeks in channels on our land, but to let the water spread out and slow down. As a result, we have several acres of gravel on which nothing grows.

This spring we have sown these

—Photos: C. Hadley Smith

THE ABOVE pictures show the condition of our experimental trench silo at Sunnygables on April 4 after a period of heavy spring rains. In the far end of the trench can be seen the grass silage which has not yet been fed out. It is of good quality. The amount of wastage is not too serious.

What is serious is the way loose dirt has broken off from the side walls and washed down to the bottom of the trench where it finally became so deep that it was impossible to drive a tractor through it to get at the silage. The drain we put in the floor of the silo did not carry off the moisture from this mud. Incidentally, one weakness of a long trench is the driving back and forth in it to get at the

silage.

As I explained, our trench is really a road dug up through a bank. This road will be permanently useful for getting to the rear of our bank barn. Whether we will also use it permanently for silage storage depends on our further experience with it. So far, we have kept from spending any money to improve the trench, and we won't spend any until we are sure we know what we want to do and that we are willing to put up with the disadvantages as well as the advantages of a trench silo over a period of years.

As I have already mentioned, we may fill the trench this spring with unchopped early-cut grass.

gravel areas to sweet clover in the hope that it will germinate and make some late summer grazing. We took this step because for several years we have been watching some natural stands in the gravel and they really seem to put out quite a little feed, particularly in August when nothing else much is growing on natural pastures.

HORSE HANDLING

Here in the Northeast the work horse is pretty much a thing of the past. This was a hard adjustment for me to make. For years when I was at home I never went to bed until I had been down to the barn and said good-night to the faithful horses and mules which furnished the farm power of those days.

For this reason, I am delighted to have come to my desk a 24-page booklet entitled, "Horse Handling Science" by Monte Foreman, re-published by

The Cattleman, Ft. Worth, Texas. This booklet is full of drawings and instructions on the training of the one group of work horses which mechanization has found no way to replace—the roping and cutting horses of the open range.

I know how authentic the booklet is because for some time now Monte Foreman has been associated with my son in New Mexico. In fact, I rather suspect that H. E. Babcock, Jr., modeled for some of the sketches. And I know that the champion cutting horse, Old Paint, whose work is so plentifully illustrated in the booklet, for several months has been at the South Springs Ranch which Howard formerly owned and where he still lives.

I'm giving Monte's booklet this free boost because I am sure there are many horse lovers who read this page who would find it thrilling. I believe that copies can be secured from the publisher for \$1.00 each.

Two of the newer treatments for Mastitis are Squibb's penicillin and Lederle's aureomycin ointment. While every scientist who has studied mastitis agrees that herd management is important, the two remedies mentioned are extremely important under certain conditions.

If you can't get Squibb's penicillin at your druggist, write to E. R. SQUIBB & SONS, Veterinary and Animal Feeding Products Division, Dept. AA-3, 745 Fifth Avenue, N. Y.

For information about aureomycin write to the Animal Industry Section, LEDERLE LABORATORIES DIVISION, AMERICAN CYANAMID COMPANY, 30 Rockefeller Plaza, New York 20, N. Y.

While you remember the cold breezes of this winter, why not consider the installation of at least one Thermopane window in your house? You can get full details by writing for the Thermopane book which is available without cost from LIBBEY-OWENS-FORD GLASS COMPANY, 2835 Nicholas Building, Toledo 3, Ohio.

The MARIETTA CONCRETE CORPORATION, Marietta, Ohio, is offering several helpful booklets to our readers. One is a 20-page descriptive booklet on Marietta silos which also contains useful information on silage feeding programs. A postcard to the above address will bring you your copy.

Today's poultryman has at his fingertips nutrition knowledge undreamed of by his grandfather. But new information is continually being made available by our experiment stations. The booklet "Their Life is in Your Hands" is available without cost from PRATT FOOD COMPANY, Dept. BC-9, Philadelphia 6, Pa. In it you will find some of the latest information about poultry nutrition.

Barn framing as practiced by our pioneer ancestors is obsolete. In modern barns laminated rafters are most commonly used. If you have plans to build or re-model a farm building be sure to use the coupon on page 24 of the March 18 issue and send it to RILCO LAMINATED PRODUCTS, INC., 601-A Brooks Building, Wilkes-Barre, Pa., for information about various types of farm buildings.

While you are in the writing mood, clip and send the page 19 coupon to TIMBER STRUCTURES, INC., another concern handling "built-up" rafters.

The new Oliver hay baler manufactured by the OLIVER CORPORATION, 400 W. Madison Street, Chicago, Illinois. Oliver's eastern branch is located at Harrisburg, Pa.

Service Bureau

By H. L. COSLINE

A SHORT LIFE

I recently received a card from a firm in Chicago, advising me that they were holding a Christmas package for me and asking me to send \$1.49 to cover cost of postage, mailing and handling charges. This sounds suspicious to me, and I am wondering if you know anything about this outfit.

According to the information we have, this outfit came into existence about December 16, 1949, as a subsidiary of an automobile gadget business. For the purpose of adding to the mailing list of the latter, thousands of post cards were sent throughout the country. These announced that gifts were being held for members of the public. The gift consisted of a three-piece pen and pencil set.

U. S. Postal authorities regarded the post card as misleading and deceptive, and the Post Office has seen fit to have the proprietor arrested. His trial is to be held in the near future.

— A. A. —

WASTEBASKET FILLER

I received some literature from a firm in Toronto, Ontario, Canada, urging me to invest in stocks in a gold mine. I do not intend to risk my money in such a venture, but am wondering whether this outfit is on the level.

You are wise to refuse to take a chance on such stocks. Right now these Canadian outfits seem to be concentrating on G. I.'s to persuade them to invest their insurance refunds. We have no record of anyone who has ever realized any profit on such investments, and a lot of folks have lost their shirts. The best place for literature of this sort is in the wastebasket.

— A. A. —

MAKING A WILL

A few months ago, there was an item on this page headed "Make a Will." In it readers were told that both husband and wife should make wills in spite of the fact that the reader who asked the questions said he and his wife had a joint deed and a joint bank account. I can't see why it should be necessary to make wills under those conditions.

Here is just one reason why such action is advisable. It is possible that both husband and wife might be instantly killed in an accident, in which case the property would go to heirs in accordance with the law, although either husband or wife might have preferred it to go to some other persons. Also, in case both were fatally injured but one died before the other, it might make a definite difference as to where the money went, particularly if either or both had children by previous marriages.

In the original item we mentioned the advisability of consulting a lawyer. The points we have brought up are just a few of the things a lawyer might call to your attention which you might not think of and which might save survivors a great deal of trouble.

— A. A. —

One of our subscribers is anxious to get in touch with Lawrence Dudley, a contractor who is believed at this time to be located somewhere in Steuben County, New York. We would appreciate hearing from Mr. Dudley if he should happen to read this item, or from anyone else who knows his present address. Write Service Bureau, Box 367, Ithaca, N. Y.

Railroads make Good Neighbors

It's true, of course, that America's railroads literally border hundreds of thousands of American farms, but what really makes farmers and railroads neighbors is their dependence on each other. Farmers supply railroads with a large part of their freight business—and railroads, in turn, serve the farmers—assembling in major crop areas the great fleets of cars required for the dependable movement of the huge production of today's progressive agriculture.

To speed and improve the handling of freight of all kinds, the railroads in the last five years alone have spent more than four billion dollars for modern locomotives, new freight cars, heavier rail and new signal and yard facilities. All these mean better service to all railroad customers, and especially to farmers.

In providing the vital transportation the nation needs, the railroads build and maintain their all-steel highways entirely at their own expense. What's more, on all their property they pay taxes which benefit every community they serve. In thus sharing materially in the cost of schools, courts and other local government services in rural areas, as well as in towns and cities, the railroads are indeed good citizens and good neighbors.

THE FARM PAPER OF THE NORTHEAST

They Got WATER!

By HARRY A. PACKARD

CITY FOLKS with convenient water taps about the house seldom give a second thought to what farmers frequently go through to obtain water for domestic purposes.

In Norway, Maine, Mr. and Mrs. William Young live on the ancestral acres of Mr. Young's great-grandfather, the old "Bill" Crocket place five or six miles from the village. Pioneer Crocket had a land grant and thereon more than a century ago built one of the first frame houses in the town, using birch bark for insulation between the outside boarding and the shingled sides of his home. A water vein which came close to the surface supplied their small needs for water.

In the hundred year old brick house which now marks the site, a surface well (so-called because it was only 11 feet deep) supplied a moderate amount of water. However, farmer Young felt the pinch a few years ago when fire broke out in his barn and he lost the entire structure with a number of valuable Jersey cattle because of the lack of water.

From dairying the couple went into turkey-raising in a small way. In this venture they felt the increasing lack of water.

While the flock was small, the pinch was not too great, but when the flock increased from 500 turkeys a year to their present endeavor of 3,000 strutting gobblers, the water situation became acute.

The famous dry seasons in the past four years climaxed the woes of the Youngs. They even hauled water two years prior to that. Imagine two ten-mile trips a day with the truck to haul 22 barrels of water for the needs of the turkeys and for domestic purposes.

Bill says that camels and elephants may be heavy drinkers but these animals cannot hold a candle to 3,000 turkeys! "Water, water everywhere" didn't apply to the Young farm. The only water on the place was what they hauled in, for the well had become as dry as a bone. Bill says the hotter the summer days and the drier the weather, "the more those blamed gobblers panted for water."

Bill Young is 66 and Mrs. Young about the same age. The doctor says she will not raise turkeys many years more, but Mrs. Young says she will raise them as long as she lives! Bill says, or rather did say, "Mother'll raise turkeys only as long as I can haul water."

At Christmas time the pair salted away a few dollars from their 1949 turkey raising. Bill said, "We'll need this for old age since we haven't any social security." But

Mr. and Mrs. William Young and their son George (in the water hole) are glad they "stuck to their guns."

Mrs. Young said, "Let's drill an artesian well!"

Neighbors were astounded. A couple traveling fast along towards three score and ten, and an artesian well could cost as much as \$2,000!

Theirs did!

The drillers began at the Young farm as soon as spring conditions made it possible. They drilled three weeks! Drillers get \$6 per foot for drilling, and there is no assurance they will be able to get water. They started the drilling at the ledge bottom of the old 11 foot well.

The first day they went down ten feet—ten feet through solid ledge rock. Nate Noble said that it was the bed rock over which the glacier passed, but that was too long ago for anyone to give it even a second thought.

In due course of time the drill worked down 100 feet. The Youngs had sunk \$600 in the hole in the ground.

The drill went 150 feet—always through solid rock. Plunk, plunk, plunk! Not a drop of water. Not even a promise of water, but a drilling bill of \$900! If you had hauled water to turkeys six years, 22 barrels a day; if you needed a new truck to haul new water to the new turkeys hatching out for the 1950 Pilgrims' feast, otherwise known as Thanks-

giving, the situation could be something to cause one to ponder seriously. "Money does not grow on trees up here," Bill declares.

Did someone say 150 feet down through the ledge rock? Well it was 170 feet through the ledge rock when the drillers went home one Friday night. Multiply that by \$6 per foot and you will see where the Youngs stood.

Mrs. Young was more discouraged than was her husband. When the drillers left for the weekend, Mrs. Young took stock of the situation.

"We will go 30 feet more and that's the end. If 170 feet has not produced water, then 200 feet doubtless will not. Bill and I have \$1,200 in the bank, which will pay for 30 feet more drilling. Then we quit!"

"That was the worst weekend I ever spent," Mr. Young says. "Mother couldn't eat the Sunday dinner she had prepared. I couldn't go fox hunting, being Sunday, and at dusk that day it began to spit snow, even though it was early spring. I would almost have sold the farm, turkeys and all, for the amount of the well bill!"

Monday the drillers showed up at noon in a blinding snow squall. "Sap snow," the farmers called it. Farmer Young wondered if he wasn't a sap, too!"

(Continued on Page 23)

Haying Rain or Shine

HAY is put up today by a dozen different methods, compared with only one or two a few years ago. Some of the new methods make a better quality product. Some save time. Others reduce the importance of drying weather.

Whether the hay is cured in the field, the mow or the silo, it's still a job that takes time, work and good equipment. Most of the things you need for the job are available at your G.L.F. Service Agency. A few are shown on this page.

Molasses

Some farmers can make good grass silage without any supplement, but most find that the safest way is to use molasses. Molasses is not only a cheap and reliable preservative for grass silage, but at the same time increases the feeding value of the ensilage. Sixty to eighty pounds of molasses added to each ton of grass as it goes into the silo assures you of good grass ensilage next winter. The sweetness of the ensilage made with molasses is very palatable to cows, and this method of preserving grass considerably reduces the odor. G.L.F. Service Agencies are prepared to supply your needs of molasses in drums or in bulk lots in your own containers.

Chopped Hay Fork

Designed for handling chopped hay and other loose materials. Five oval tines that are 19 inches long. Convenient four foot handle with steel Dee grip and balanced for good leverage.

Loose Tine Hay Fork

Bigger capacity, precision built fork for loose or baled hay. All steel with forged tines. Each tine set independently. Cleans most racks in three forkfuls, or takes nine bales.

Manila Rope

G.L.F. rope with the green stripe of quality woven the full length. Strong, pliable, non-kinking. Lubricated to reduce internal friction for longer life.

Baler Twine

Uniform, smooth twine for even running in the baler. Pliable and strong enough for firm baling. Insect and rodent repellent. One ball of 20 pounds bales approximately six tons of hay.

Farm Hoist

Save the use of a tractor and an operator. One man can set fork and operate hoist from the load easier and faster. Two rugged models to choose from—one with return drum. Available at new low prices.

Reversible Fork Carrier

Smooth running, dependable carrier. Wide throat allows fork pulley to enter carrier from any angle. No springs to rust or break. Lock grips frame so load swings freely.

Pulleys

All steel and good hard maple. Free rolling, non-chafing design and ruggedly built for long trouble-free use. Smooth finish to reduce wear. Selection of sizes to best meet your needs.

Laminated Rafters

For maximum hay storage use G.L.F. clear-span laminated rafters. No posts in the mow. Ideal for maximum storage space at lowest cost.

COOPERATIVE G.L.F. EXCHANGE, Inc. ITHACA, N. Y.

G.L.F. Supplies and Services for Haying

An Outdoor Fireplace for Family Fun

By EDMUND NORTHRUP MOOT

AN OUTDOOR fireplace can become the center of social life in plans for your ever expanding outdoor living room. A stone or brick fresh air cooking unit may have limitless originality in design, but certain definite structural features are important if it is to be successful.

Location is most important. The prevailing summer wind, in weather suitable for outdoor activity, comes generally from the Northwest. The fireplace chimney must carry smoke away

FIREPLACE "A". Features flue-lined chimney, standing space at sides and front, top griddle and varying level roasting grills.

from the cooking surface, not cause it to be blown in the face of cooks or those enjoying the fun of preparing their own roasted delicacies. Discover the northwest corner of your lawn area and construct the open face end of the hearth toward that direction.

The base, made of concrete carried below frost level, may be made similar in form to a gold cap over a decaying tooth. It need not be of solid concrete aggregate. A six-inch trench, dug around the border of the area which you plan to use as a base, will hold a firm foundation for the fireplace of your dreams. Those who have built prefer a base at least two feet longer in the front than is necessary for the fireplace itself. Some may prefer cooking at the side instead of directly in front of the flames. Bear in mind there are left-handed and right-handed cooks, if you plan standing area on one side or the other. Fireplace "A" illustrated here has standing space on both sides as well as front. This fireplace has a

FIREPLACE "B". This solid-looking number has metal plate draft control and an open face oven. Material was from old stone wall.

well-masoned cap for the tile lined brick chimney along with a homemade metal shell for the fire area to hold a top griddle and varying level roasting grills.

Built-In Oven

Some outdoor cooking fans like to dabble in baking their favorite rolls and muffins. Intense heat will develop in a stove oven with a steel sheet base. Fireplace "B" has a metal plate draft control and open face oven along with rigid solidarity. An old stone wall fence provided all materials except draft door and oven base. This particular fireplace literally roars when going full blast. It has been used in boiling down sap at sugaring time, too. Its location has proven it to be valuable as an incinerator, even for diseased birds from the poultry flock.

There are those who line the fire pit with brick as in fireplace "C". The removable grates make it easy to keep this fireplace clean. There is less chance of field stones bursting from fire heat.

All three of these fireplaces have a common desirable feature, the height of the cooking area. Height is determined by the average distance from the ground to the hands of members of the family who do the cooking. More and more folks are using the griddle idea of roasting marshmallows or hot

FIREPLACE "C". Removable grates make this fireplace easy to clean. It is brick lined to protect field stone from heat of fire.

dogs, instead of the possibility of having them fall off into a hot fire or glowing coals.

Electricity Helps

A suspended electric light over the fire area can add much to an evening of fun around the outdoor fire.

More and more it is becoming possible to provide family-centered fun with a modern touch. The entire project will tax the mechanical ability of the lads in your family who just want to do something. Experience in masonry may be valuable in some future farm building venture. Welding practice may result from making a homemade spit for barbecue efforts or creation of a metal core for the grills as well as draft regulators and ovens.

Some of our farm friends are nurturing the abilities of growing carpenters with plans for chairs and benches around the fun center. Complete sets of aprons, gloves, holders, and covers have been devised by young homemakers. The artists of the forge are shaping grills, griddles, forks, and toasters for open-air meals. Lack of imagination is the only hindrance to full utilization of a fresh air kitchen.

Frost hasn't blocked the view through this Thermopane window even in coldest winter, and the family can sit comfortably right next to it while eating. Installed in 1946 in a northern Illinois farm home.

Bring Views IN...Shut Cold OUT

Those big, view-framing windows you want call for *Thermopane** insulating glass . . . for clear vision, heating economy and greater year-round comfort.

In winter especially, you'll notice the difference this double-glass window makes. It cuts heat loss, saves fuel. Helps keep windows clear of frost, helps protect sills and walls from dripping moisture.

And—there's no "low-comfort zone" next to windows of *Thermopane*. Its sealed-in blanket of dry air keeps the inner pane near room temperature . . . eliminates the chilly drafts you feel near single-glass windows. With *Thermopane*, your entire room stays warmer in winter. Cooler in summer, too. For *Thermopane* stays in the year 'round . . . saves you all the work and bother of storm sash.

In new or remodeled homes, *Thermopane* provides the built-in insulation large glass areas should have in cold climates. It's the *best* way to insulate double-hung and casement as well as picture windows. For building economy, it is made in over 80 standard sizes, available through glass and building supply distributors and dealers. For details, write for our *Thermopane* book. *®

YOU CAN BEAT THE LOW MILK PRICES

WHEN a group of our Eastern farmers complained to some grain growers in the Midwest about the high prices of grain, the Midwest farmers retorted by saying we ought to leave the grain prices alone. "For if grain prices go down," said the Midwest growers, "we'll put on cows, feed out the grain at home, and compete with Eastern dairymen for the milk markets."

We of *American Agriculturist* think that Eastern dairymen could have the last word in this argument by growing more of their own grain at home, and we are finding more and more Eastern farmers who are doing just that.

Both ideas and conditions have changed today, making it more practical to grow corn here. It is now known that it is no longer necessary or even profitable to feed a 20% ration. The new hybrid corns now make it possible to mature corn for grain on most northeastern farms. With a program of improved pastures, better meadow grasses and more legumes, possibly grass silage, and with half or nearly half of the grain grown at home, plus good cows, a good dairyman can make at least some money even in bad times.

How much of this program can you still start this spring?

A GUIDE FOR GOOD LIVING

THERE is a story about the porters that a white man hired for an expedition into the interior of Africa. The white man was always in a hurry and kept shoving the porters harder and harder until one day they sat down and refused to move. When questioned, the leader said they were waiting for their spirits to catch up with their bodies.

Most of us today could well apply that same philosophy. We have made all kinds of material progress, we are living in an age of gadgets, but with all of our getting we have failed to get understanding. We need to sit down and let our spirits catch up!

Professor R. C. Braithwaite of the State College of Home Economics at Cornell University said recently: "The crisis of our age is a crisis in spiritual values."

Two old friends came over to our farm the other day to render me a service. When I tried to thank them, both pointed out that the older they got the more they realized that the greatest joy in life and the only real religion is in doing something for somebody else—the practical application of the Golden Rule. Professor Braithwaite said the same thing in another way when he stated that parents can best help their children towards spiritual growth by teaching them, mainly through example, the Golden Rule, a reverence for life, an awareness of beauty, and a belief in the Deity.

SELL REEF STUFF NOW

HOW's the market for beef cattle?" I asked my friend Ray Hemming of the Empire Livestock Cooperative Association about the middle of May. "It's crazy," he answered. "Stock in even fair condition is bringing wonderful prices."

"But," he warned, "these may not hold up after everything is out on pasture."

I mention the subject now because it is probable that you never will have a better opportunity than you have right now to dispose of your boarders and other surplus stock, or even some of your young cattle which do not promise too well for milkers. You can help reduce surplus milk this way also.

DON'T OVERLOAD THE HAY MOW

SEVERAL years ago a friend of mine baled his hay for the first time and then made the mistake of stacking the bales all in one mow, the same quantity that as loose hay would have been distributed among two or three mows. The overloaded beams gave way and down came the whole mess into the

cow stable. Fortunately, the cows were out of the barn at the time. But think what a job it was to move all of that hay and repair the barn.

The Barn Equipment Association states that the same mistake is often made, and that most barns are built with mow capacity for loose long hay, which weighs approximately 4 lbs. per cubic foot. Baled hay weighs approximately 14 lbs. per cubic foot, so it is possible to store three times the weight of baled hay that the mow was built to carry.

A good way to avoid overloading is to drop the bales in the mow and leave them piled loosely the way they fall. In that way they bulk up larger, use more space, and, because there is more air spaces between the bales, the hay cures better.

FOR BETTER PAID MINISTERS

A FRIEND of mine is the pastor of a Protestant church in a village. Both he and his wife are highly educated, each with a Master's degree. He works hard all of the time, and his wife also spends most of her time on church work. This pastor receives \$2,500 a year, out of which he feels it necessary to make contributions of \$1,000 to various religious and charitable causes, reducing the income on which to support himself and family and educate his children to \$1,500.

Ministers have always been grossly underpaid. No man who enters the profession does so for monetary reasons, of course, but the church will never rise to its full possibilities of service to its people and the community until ministers are paid enough so that they do not have to worry over finances. Also, salaries should be large enough to attract men of the highest possible calibre.

Three or four or more small churches limping along in a small community can never hope to do what one union or consolidated church can do, well financed and attended.

RESULTS FROM TEAMWORK

"A short time ago it was my pleasure to attend a dinner meeting where some 50 men, every one a top leader in agriculture in New York, met together and discussed the problems that agriculture faces today. This group included at least one person from each of the many organizations which make up what I call the sound farm groups of our state. Not a single person there was at odds with any other individual. It was an example of perfect harmony. It shows what can be done to bring groups together and benefit by their thinking. I am sure that everyone in attendance had the same idea as I did when the evening was over—all felt that each had gained something by being there.

"Some thirty years have passed since this idea (the Conference Board of Farm Organizations) had its beginning in New York. It is being carried on in the same spirit in which the idea was created—in unity there is strength." — *Henry D. Sherwood, Master of the New York State Grange, writing in the National Grange Monthly.*

NO other one thing that New York State farmers have ever done has brought them more results than the organization of the Conference Board of Farm Organizations. It's a prime example of teamwork, with all the statewide farm organizations pulling together.

A LONG-LIVED PRODUCER

THE American Jersey Cattle Club reports the record of "Old Ruby," a Jersey cow who produced 14,988 pounds of milk with 824 pounds of fat in 1948. Yet she was 20 years old last May and made more milk and fat in her last herd test year than ever before.

As of December 1, 1949, "Old Ruby" had produced 184,883 pounds of milk (over 92 tons) with 10,226 pounds of butterfat (over 5 tons) and she is still going strong. Ruby has been on test 18 consecutive years and has averaged 10,271 pounds of milk and 568 pounds fat each year.

For years, we of *American Agriculturist* have

been interested in these long-time producers. When you realize that the average cow is at the height of her production for only about 3 years, and then begins to taper off, you get some idea of the huge cost of replacements.

Why is the productive life of the average cow so low, and what can be done about it? Well, taking "Old Ruby" as an example, in the first place she had long lines of good breeding back of her. In the second place, she was well raised, and in the third place, she was lucky—or her owners were extremely careful—in escaping disease, for disease more than any other factor is the chief reason for high replacements in most herds.

SKIM MILK IS GOOD FOOD

ONE of my older brothers used to tell a story with great glee about finding me in the hoghouse when I was about three years old, up on top of a potato crate eating the rich white curds from the top of the swill barrel!

Maybe those white curds could have been served under slightly more sanitary conditions, but I still hold that my three-year-old judgment of the curds as food was good, for they represented part of the solids-not-fat in milk, and personally I have always thought there has been too much emphasis put on butterfat, or rather not enough on the food value of the solids in milk other than fat.

You old-timers will remember, as I do, when we brought home the skim milk from the butter factory and fed it to the hogs and the calves. You'll remember, also, how that young stock thrived on skim milk! Yet even then skim milk could be bought for 10 or 15 cents a can, and to this day the surplus price for milk solids-not-fat is hardly enough to pay transportation charges.

I submit that there would be a different and better day in the milk business if there was better recognition of the food value of milk in addition to the butterfat.

FLIES ARE DANGEROUS

DOCTORS and representatives of health departments are putting more emphasis than ever on the dangers from flies. A recent examination of flies showed that there is an average of one and a quarter million bacteria on a fly's body and sixteen to eighteen million in the intestines. The fly is one of the worst disease carriers. It spreads bacteria that causes dysentery, typhoid and food poisoning. They wade in filth and then walk over the food, the dishes, and the baby's face. Of course they cut down milk production, too.

Methods of control include good screens, keeping food covered, cleaning up all the trash around the house and barns, removing garbage far from the house and covering it, and, finally, the use of a good spray in both the house and barns.

EASTMAN'S CHESTNUT

NO one knows the rural districts and rural folks better than my friend Carl Carmer, and if you live in the country—or in fact anywhere else—and haven't read his stories of country life in the Empire State—dramatic, pathetic and funny—you have really missed something.

A storekeeper over at Raquette, says Carl in "Dark Trees to the Wind," had a hammer stolen from his store. Come the last of the month, he sent every one of his customers a bill for it. He got a lot of complaints, but he got his hammer paid for.

Here's another one of Carl's I have laughed about many times!

"Other side of the mountains by the St. Lawrence River there was a fella got mad at his neighbor and give out he'd pay five dollars to the man who shot him. The neighbor heard about it and accused him of it.

"It's a lie," said the man. "I might-a said two dollars but I never went over that."

AA's Farmers' Dollar Guide

MILK NEWS: Dr. Harry Young, economist of the Metropolitan Cooperative Milk Producers Bargaining Agency, estimates that the uniform price of June milk will be above \$3.00. If 40% of all milk is sold as Class I milk the blend should be around \$3.21.

Incidentally, an increase of 2% in the amount of milk going into fluid in June would raise the price to dairymen about 10 cents. It looks like good business to support "Milk for Health" which will cost only one cent per cwt. It takes time to call on all dairymen who do not belong to cooperatives and get their authorizations to deduct one cent a cwt. You could help by writing to "Milk for Health", Onondaga Hotel, Syracuse, N. Y., for a blank authorization form.

Milk price cutting continues in New York. No one knows what the end will be, but those who understand the New York situation agree that distributors are losing money and that eventually dairymen may be asked to stand those losses. Some feeling is developing that State and Federal Departments of Agriculture have power to correct this price cutting if they would use it.

Latest development is a civil anti-trust suit filed by 16 independent New York City milk dealers against Sheffield Farms, Inc. and its affiliates. Claiming that the milk price war was started by Sheffield last fall and alleging that losses therefrom total over one million dollars, these 16 firms are asking triple damages. These 16 dealers, who are among 30 handlers who own milk plants in New York City, charge Sheffield and its affiliates with an attempt to drive them out of business and monopolize the Metropolitan New York fluid milk market.

PRICES: Some economists now feel that this year's price decline in farm products will be less than the 10% predicted earlier. The index of prices for farm products has moved up 4% from the low point last fall and some farm supplies are down slightly. Fear by farmers that prices of farm products will continue downward seems unjustified for the immediate future.

BRANNAN PLAN: Good arguments from many points are hammering away at the Brannan Plan. Allan Kline tells in COLLIER'S why plan is bad for consumers and farmers. Harold Cooley, Democratic Representative from North Carolina and chairman of the House Agricultural Committee, denounced the Brannan Plan recently. Representative Clifford Hope of Kansas says, "Interest in the Brannan Plan is due in part to two things, the Plan's unquestionable political appeal and its questionable economic soundness." Representative Hope points out that 15 pages of the bill which put the plan into legislative form relates to penalties on farmers, and he predicts that if this bill ever becomes a law the country will have to have more farm bookkeepers or bigger jails. Meanwhile USDA spokesmen, including Secretary Brannan, on salaries paid by taxpayers, continue efforts to sell plan to farmers and consumers.

CROP PROSPECTS: Hay is getting off to late start in the Northeast; also pastures. Many dairymen have had to buy hay thus adding greatly to cash costs of milk production. There will be little or no hay held over and prospect for this year's crop is distinctly discouraging due to unfavorable weather.

Truck crop acreage will be higher than last year, up about 8%. Early summer onion acreage, down slightly; late summer crop up 7%. Cabbage, early summer crop about same as last year; late summer crop up 6%. It is reported that canners are slow to contract for snap beans. Canners are offering prices 10 to 20% below last year for sweet corn. Canned corn stocks are high.

FRUIT: It is too early at this writing to estimate the Northeast fruit crop. There has been considerable damage to fruits (and vegetables) in several southern states.

REMINDERS: ● Start fly control early while flies are scarce. The man who waits until July when there are millions of them is licked before he starts.

- Investigate possibilities of chemical weed control to cut production costs.
- Keep the pullets growing. Early eggs will bring best prices.
- Use more home-grown food on the family table and eat better at less cost.

The Song of the Lazy Farmer

MIRANDY'S all upset today because the rain won't stay away; she's washed the clothes and piled 'em high but can not hang them out to dry. My neighbor, too, is in a sweat, he's sure that he will never get his work caught up unless the sun comes out and stays until he's done. The youngsters in the neighborhood are feelin' anything but good; they say they can't be happy when their ball game's been rained out again. The birds are sad, so is the cat, our pooch looks like a half-drowned rat, and all because they can not play out in the warm sunshine today.

Now, all this goes to indicate how folks can be upset by fate; there's no excuse to be annoyed by something that you can't avoid 'cause obviously there ain't a thing that you can do to ease the sting. And so you might as well relax and let it rain or pay your tax; those things will never change a bit just 'cause you up

and throw a fit. Today, for instance, I agree, it would be nice if I could see sun beating down on neighbor's land and dryin' clothes to beat the band; but fate decreed it otherwise, so I'll just sit and close my eyes; I know the rain is bound to quit, so why should I be mad at it?

FARM NEWS from DU PONT

SAFE NEW MARLATE—Du Pont Insect Killer Has Many Advantages on Crops and Livestock

For a fly spray that's effective, long-lasting and the last word in safety, the name to remember is "Marlate"—Du Pont "Marlate" methoxychlor insecticide. It comes as a 50% wettable powder ready to mix with water.

"Marlate" is the only fly spray with residual efficiency being recommended for use on dairy cows and on animals being finished for slaughter. It can also be sprayed on walls of dairy barns and milk houses to give control of flies over a period of several weeks.

Stable flies, hornflies, houseflies, lice and mosquitoes are common livestock pests that "Marlate" controls. It kills them without danger to the people who apply it, to the animals it's used on, or to people who consume meat or milk from treated animals.

ON VEGETABLES, FRUIT and forage crops, "Marlate" is also toxic to a wide variety of insects. In addition, it doesn't burn or stunt sensitive

plants such as cucumbers, melons, squash and tomatoes. Since the normal residue it leaves on crops is not dangerous to humans or animals, it can be safely used for control of crop insects close to harvest.

CUCUMBER BEETLES are one of the crop pests that "Marlate" controls plus Mexican bean beetle, pepper weevil, cabbage worm and looper, melon and pickle worms, tomato pinworm, flea beetles, leafhoppers and many others that attack vegetables. "Marlate" is also excellent for control of cherry fruit flies, Oriental fruit moth, codling moth, grape leaf skeletonizer and other insect pests of early apples, peaches, prunes, cherries, apricots and grapes. Likewise, it is outstanding on alfalfa for safe and effective control of lygus bug nymphs and alfalfa caterpillar.

"Marlate" is a product of 8 years of Du Pont research aimed to provide farmers with better chemicals that combine high effectiveness with great safety.

DU PONT CHEMICALS FOR THE FARM INCLUDE:

Fungicides: PARZATE* (Liquid and Dry), FERMATE*, ZERLATE*, Copper-A (Fixed Copper), SULFORON* and SULFORON*-X Wettable Sulfurs . . . Insecticides: DEENATE* DDT, MARLATE* Methoxychlor, LEXONE* Benzene Hexachloride, KRENITE* Dinitro Spray, EPN 300 Insecticide, Calcium Arsenate, Lead Arsenate . . . Weed and Brush Killers: AMMATE*, 2,4-D, TCA and 2,4,5-T . . . Also: Du Pont Cotton Dusts, Du Pont Spreader Sticker, FARMONE* Fruit Drop Inhibitor, and many others.

*REG. U. S. PAT. OFF.

On all chemicals always follow directions for application. Where warning or caution statements use of the product are given, read them carefully.

MILD NEW FUNGICIDES IMPROVE YIELDS OF FRUITS AND VEGETABLES

Many growers of fruits and vegetables report greater vigor of growth when they control disease with Du Pont organic fungicides . . . "Fermate" . . . "Parzate" . . . and "Zerlate." These Du Pont fungicides have such mild reaction on foliage and fruit that the plants grow and produce to their fullest extent.

IN A SIX-YEAR TEST ON APPLES, "Fermate" improved the yield of scab-free fruit 74% and increased the total yield 59%. "Fermate" also controls rust, black rot, and sooty blotch on apples and pears, as well as brown rot of stone fruits, leaf spot of cherries and grape black rot.

FOR POTATOES, "Parzate" is outstanding in control of early and late blight. In tests with 7 fungicides, "Parzate" gave the highest yield and produced 236 more bushels per acre than untreated potatoes. "Parzate" is also excellent for control of the leaf blights of tomatoes, celery, etc. Du Pont "Zerlate" controls tomato anthracnose and downy mildew of cucurbits.

For supplies of "Marlate" and other Du Pont pest-control products see your local dealer. Ask him for free booklets that give detailed information, or write Du Pont, Grasselli Chemicals Dept., Wilmington 98, Del.; 152 Housel Ave., Lyndonville, N. Y.; 55 Maple Ave., Sodus, N. Y.; 34 Riverside Ave., Rensselaer, N. Y.; 350 Fifth Ave., New York 1, N. Y.

BETTER THINGS FOR BETTER LIVING
... THROUGH CHEMISTRY

Listen to Du Pont "Cavalcade of America"—Tuesday Nights—ABC Network

The self-powered NEW HOLLAND harvester, shown here being operated on the Aaron Glick farm, Lancaster, Pa., by Ivan Glick, will throw up to 8 tons of semi-cured hay or 20 tons of corn per hour into the wagon. New Holland now has a new lower cost power take-off model in production that's modelled after the one shown here and has the same capacity when 31 h.p. is delivered to the machine. Controls on both models are within easy reach of the driver.

This McCORMICK field hay chopper by International Harvester has the same type pickup cylinder and feed mechanism as on their pickup balers, and the same type cutter head used in McCormick ensilage cutters. The deflector spout is automatically centered on the wagon so that no hay is lost on turns.

The MASSEY-HARRIS forage clipper does an efficient job cutting standing grass and legumes for silage. A wind-row pickup attachment is available for those who want to wilt grass silage or field-chop hay and straw. Chopped material is delivered to the side or rear. PTO and engine units are available.

A new mower-bar attachment for cutting standing grass into silage has been added to the GEHL forage harvester shown above. This eliminates mowing and windrowing operations required in the wilting process of making grass silage. This unit is interchangeable with the Gehl windrow pickup or standing corn attachment.

A purchaser can buy one or all three attachments for the ALLIS-CHALMERS forage harvester to harvest corn silage, pick up windrowed crops, or for a once-over field operation in which grass crops are cut, chopped and delivered to a trailed wagon for easy transport to storage. It uses power take-off.

Forage Harvesters

Key Machines for Modern Grassland Farming

By JIM HALL

WE USED TO think a side delivery rake and hay loader just about the last word in equipment — until the forage harvester came along. Now these machines have been perfected to such an extent that one basic unit equipped with easily changed accessories can gather hay or grass from the windrow, corn for silage from the rows, or go out and mow the standing grass. In all three operations, the unit chops the forage to the length desired and loads it right into wagons, trailers or trucks.

One man can, if need be, do his own harvesting by using a trailer behind the harvester and stopping the operation after each full load to take it to the mow or silo. However, a more efficient method is to have another man to bring out an empty trailer to be filled while he tows the full one away. Others find it easier to set the harvester for side delivery to fill trucks driven alongside, but this means two men are working to fill one load. In both these cases, enough trucks, trailers or wagons should be used so that an empty is ready for reloading just as soon as one is filled. In most cases where the haul to the barn isn't very far, two trailers or wagons are enough when equipped with any of several types of mechanical unloaders.

Most of the manufacturers offer power take-off models with attachments for picking up windrowed crops and cutting and chopping silage corn. Several offer cutter bar attachments which are proving very popular with men who want to mow, chop and store grass silage with-

(Continued on Page 12)

The PAPEC Machine Company offers two self-powered forage harvesters of 38 and 48 h.p., and a power take-off unit on which an engine may be mounted if desired. The powered unit shown here is delivering a stream of grass for silage. For the power take-off unit they recommend a 3-plow tractor.

The J. I. CASE model "C" forage harvester, like most makes, provides for either side or rear delivery. It's shown here cutting 16-foot corn on the James Chambers farm at West Brook, near Walton in Delaware County, New York. Pick-up units for harvesting windrowed crops and engine attachments for the power take-off models are available. A cutter-bar unit is built for harvesting standing forage crops, but only a limited number of these will be available in 1950. Case offers both power take-off and engine powered models.

The FOX Cutter, as they call their forage harvester, is shown at work here on a Wisconsin farm doing an especially clean job of harvesting silage corn. It's another of these modern machines that can harvest standing or windrowed grass, hay and row crops. The Fox equipment is self-powered.

The EAGLE forage harvester, made in both motor and power take-off models, has interchangeable attachments for both row and field crops. Like other makes of these versatile machines, it eliminates hand labor handling corn bundles and loading hay. Hay leaves are saved and corn is dirt-free.

A ton of grass silage can be put up in less than a man-hour using a field chopper, but it takes more than 2 1/4 man-hours with the mower-loader-ensilage cutter method. Above is a JOHN DEERE chopper making grass silage on John Luchsinger's farm near Syracuse, N. Y.

AMERICA'S NO.1 ECONOMY TRUCK

Farmers everywhere are switching to this big 6½-ft. Ford F-1 Pickup. It has a 95-h.p. 6-cylinder engine, 100-h.p. V-8 available at only slight extra cost. G. V. W. rating is 4,700 lbs. Body capacity is 45 cubic feet.

RECENT PRICE REDUCTIONS AND 10 BIG EXTRA VALUES MAKE FORD THE ECONOMY LEADER ON THE FARM!

WHY PAY MORE! With Ford's recent price reductions, there isn't a full-size Pickup in America at a lower list price than the popular 6-cylinder Ford Model F-1.

WHY ACCEPT LESS! Included in the new low Ford Pickup price are money-saving features like an oil filter, oil-bath air cleaner and many others.

For quick proof that the Ford Pickup is America's No. 1 Truck Value for the Farm, look in the box at the right which lists the 10 big extras it offers you. And remember, all these and many more advantages are yours **AT NO EXTRA COST.**

Ford Trucks last longer! Yes, it's a fact, for the fourth successive year—life insurance experts **PROVE** Ford Trucks last longer. Ford trucking definitely costs less!

**AT NO EXTRA COST—
10 BIG FORD FEATURES**

Over 175 models to choose from! Whatever your farm hauling requirements are, there's an Economy Ford Truck to do the job and to do it for less cost. Truck users everywhere are switching to Ford. And the proof of this fact is that Ford is currently making the industry's biggest sales gains. See us for these *extra values*.—plus prompt delivery, good trade-in allowances, liberal terms!

1. **45 CU. FT. BODY CAPACITY** for bulky loads. Lowest loading height of any 6½-ft. Pickup.
2. **1480 LB. PAYLOAD CAPACITY** for heavy loads.
3. **STRONG BONUS BUILT FRAME** with section modulus of 2.65.
4. **UP TO 13% MORE BRAKE LINING AREA** for safer, surer stops.
5. **BIG 10" GYRO-GRIP CLUTCH** with low pedal but high plate pressures for long lining wear, less slippage.
6. **LIGHT CURB WEIGHT**—only 3,220 lbs.—gives large load carrying capacity.
7. **ALUMINUM ALLOY FLIGHTLIGHT PISTONS** for lighter bearing loads, longer bearing life.
8. **OIL FILTER AND OIL BATH AIR CLEANER** (standard) prolong engine life, cut oil cost.
9. **FORD LEVEL ACTION CAB SUSPENSION** insulates cab from vibration, frame weave.
10. **DOOR GLASS AIR WING VENTILATORS** (standard) scoop in fresh air, sweep out stale air.

Ford Trucking Costs Less Because— FORD TRUCKS LAST LONGER

Using latest registration data of 6,592,000 trucks, life insurance experts prove Ford Trucks last longer!

DOUBLE USE OF QUONSETS ADDS TO FARM INCOME

Versatile, all-steel buildings safeguard crops—
serve as farm shelters the year around

■ **Quonsets for crop storage!** Here is one way to add to farm income. Use Quonsets! Hold your crops for highest prices! Strong, sturdy, durable, all-steel Quonsets provide maximum protection for stored crops at a low cost per bushel . . . provide the utmost in usable space. Quonsets can easily be partitioned to store more than one crop at once.

■ **Quonsets for equipment storage!** You have no worries about equipment when it is sheltered from wind and weather in a Quonset! The versatile fire-resistant Quonset is the best answer to the general equipment storage problem during off seasons . . . eliminates the need for an extra storage building.

Your best buy in farm buildings

Big Cows Need Room

By H. L. COSLINE

Big cows also eat a lot of feed. Soon the basket will be replaced by a feed cart.

FOLLOWING a fire which burned the old one, Bernard Aungier and his father built a new barn on their farm near Lafayette, Onondaga County, New York. There is still some inside construction to be finished, particularly the feed room. However, the cows have tried it out during the past winter and it seems to be satisfactory; at least they looked very contented when I saw them on a cold day in early April.

As is usually the case when I see a new or remodeled barn, three things stand out. First, ventilation. When I was a young fellow on the home farm, dairy barns had what you might call "natural ventilation"—through cracks. Soon after, dairymen began to build tight barns only to find that, in winter, moisture dripped from the roof boards during warm periods, while in cold weather it turned to frost. A roof that was wet half the year didn't last long. Neither did cows thrive in tight stables without fresh air.

Fresh Air

The ventilation system in the Aungier barn has a 1 inch slot all around the stable at the ceiling. Fresh air comes in there and foul air is pulled out of the stable by two electric fans. One of the fans runs continuously; the other is operated with a thermostat and turns on and off according to the temperature. So far, the system seems to be working very satisfactorily.

The second barn point which always impresses me is the matter of room. In the Aungier stable, individual cows have stalls varying from 4 feet to 4½ feet in width and from 5 feet 2 inches to 5 feet 8 inches in length. "In the old barn," said Bernard, "when one cow was lying down, two others had to stand up."

The third impressive feature of modern barns is the arrangement to save labor. In the Aungier barn the milk house adjoins the stable at one side. The hay is stored overhead. Also, about in the middle of the hay mow is the partially completed feed room which will have chutes to carry grain down to the cows. Bernard apologized for feeding the cows with a basket while I was there, saying that it required too many steps. They will have a feed cart shortly. The manure spreader is driven through the center alley to be loaded, and the manure is taken directly to the field when weather permits.

Bernard has been farming in partnership with his father since '39 but he plans to take over the operation of the place on his own this spring. Including land that is rented, he is operating 240 acres. The barn is 126 feet

long, 36 feet wide, with 50 stanchions and 2 pens. He has been building up his herd since 1939 by buying purebred calves from some of the best herds in the county.

I asked about artificial breeding. Bernard replied, "I joined the Onondaga Association when it was first started 10 years ago. I am thoroughly

A nice lot of youngsters being grown to "take over" milk production in due time.

convinced that the conception rate is as good as natural service, and I believe the men who pick the bulls know more about that job than I do."

Bernard certainly did a good job of buying his foundation Holstein calves. The summary sheet of the Onondaga County Dairy Herd Improvement Association shows that for the year 1949-'50, his herd averaged 12,284 pounds of milk and 432 pounds of fat.

—A.A.—

MOTHERS BY PROXY

AT SAN ANTONIO, TEXAS, the Foundation of Applied Research is experimenting with the transplanting of fertilized ova from one cow to another. The purpose of these tests is to explore the possibility of producing several calves from a good cow each year, rather than one. In other words, if an egg could be transferred to a scrub cow from a high-producing pure bred cow each time she came in heat, she would transfer her inheritance to every one of these resulting individuals.

At this ranch, ten scrub cows selected as "proxy mothers" are carrying calves six months after the transfer of these eggs. The first tests were unsuccessful in that the cows aborted before the calves were born. It is hoped that these will carry calves the full term.

The Aungier farm with the comfortable farmhouse at the right.

My Experience with Roadside Marketing

By HERBERT C. BARKER

I WAS BORN on a farm and during most of my sixty years have owned or been connected with, a farm. In 1929 and '30, when engaged in a non-farming business, along with thousands of others I became a casualty of the times and was obliged to think fast as my family still wanted to eat.

I was well aware that the usual procedure of selling farm products did not put a fair share of the consumers' dollars into the farmers' pockets. I decided to try direct farm-to-consumer marketing in which I had long been interested, and for that purpose leased (with privilege to buy) a few acres on a main highway about twenty miles out of Philadelphia.

We planted the ground to asparagus, rhubarb, berries and the usual annual crops such as sweet corn, limas, snap beans, beets and carrots, and a year or so later, a sizable plot of flowers for cutting.

This policy, with some addition of land as well as purchases of products from nearby farms, was continued and expanded over a period of fifteen years (at the end of which the project was relinquished to the succeeding generation).

Started Small

We opened our stand — a very attractive 20x24 clapboard building with wide porch, painted white—on Saturday, March 4th, 1933. Many will remember those were dark days when no one felt very optimistic about starting any new adventure. Sales of the first day were \$14.05, and the first year (March 4th to Dec. 31st) were \$6011.31. The first few years were rough sledding but without exception, each succeeding year brought new customers, added products and increased sales, until the latter reached well beyond the \$100,000 mark annually.

Our first sale was one dozen eggs for twenty cents to a neighborhood man who later moved eight or ten miles away and we lost track of him. Several years later, in recognition of him as our first customer, we looked up his address and mailed him a certificate extending the privilege of purchasing several dollars worth of produce free any time during the following twelve months. Within a few days he showed up at the market and made some purchases. When asked for his certificate he claimed he thought the matter a joke but nevertheless had it with him. The amount of the purchase was charged against it and practically every Friday evening since, he and his wife

have stopped in and shopped with us.

From my experience I would like to make a few observations and to name and enlarge a little on a few of the factors which I believe essential to the success of roadside marketing.

First, the market must be located on a well-travelled highway convenient to, though not necessarily nearer than twenty or twenty-five miles to, a large group of potential buyers.

A very considerable volume of produce may be sold in season to the traveling public, but a year round business will be much more stable if fortified with permanent, regular family trade.

Other essentials are parking space, buildings, quality products and sales personnel.

The necessity for ample parking space cannot be over-emphasized. Many small and larger roadside markets have jeopardized their success by inadequate off-the-road parking for the cars of prospective customers. Cars will not stop unless they can do so readily and in safety and can leave when ready to go. Daily cleaning of the parking area is a must; otherwise it will become unsightly with scattered papers, empty cigarette packs and other refuse.

As to buildings, I fully realize that many farmers may not want to do more than to dispose of small amounts of products in season. Satisfactory and profitable stands may vary from the small unattended "pick up and leave your money" shed or canopy which will protect the small display from the weather, to the somewhat larger child-attended stand on to the large markets outfitted with cold storage facilities, computing scales and all the other desirable modern features and equipment, and which employ several clerks and do a very considerable business.

Must Be Attractive

Whatever the type of building, if a desirable class of trade is to be had, it must be of good appearance, not marred by numerous gaudy signs advertising this and that. A few neat well-placed signs are desirable and every stand should plainly show the name of the operator. The public is entitled to know with whom it is doing business.

An investment made to acquire the foregoing, be it large or small, is worth little unless two qualities are added. These are quality of products and quality of salesmanship.

It seems to be an all too common failure of farmers to fully recognize the importance of grading farm products and offering for sale only that which is good. Second grade and inferior products can generally be disposed of at a price to some one situated to use them. Wilted or otherwise unattractive or low grade products must not be displayed or offered to the general trade.

The practice of "topping" products which are sold in packages or baskets is also a sure guarantee of failure. A customer who, upon reaching home, finds the basket of potatoes or apples he has purchased are better or fully as good down through as on top is a sure repeat customer.

The Best Advertising

A pleased customer delights in telling his friends where to buy. This is the very best advertising and little other will be found necessary.

As to the sales personnel, only those persons who are familiar with the

A Visit With the Editor

IT IS my privilege to have as a friend the Honorable Harvey D. Hinman of Binghamton, New York, in many respects one of the most remarkable men that I have known. Mr. Hinman has been an outstanding and successful lawyer for a long lifetime, but more important still, he has been a leader in constructive enterprises for his neighbors and community and has stood for and practised the truths and the principles that have made America great. Beginning on a poor New York State farm 85 years ago, Mr. Hinman's own life is another of the thousands of examples of poor boys who rose to leadership and success because America of the past gave them the opportunities to make the most of their abilities.

Following are excerpts from an address made a few weeks ago by Mr. Hinman on the occasion of the Lincoln Day tribute paid to him by the Young Men's Republican League of Broome County, New York. I am only sorry that space does not permit printing all of his talk.—E. R. Eastman.

MR. PRESIDENT, I am near the other end of that trail 'where the shadows lengthen and the even falls.' Looking backward over my 85 years' pilgrimage on that trail, I can, and do, thankfully declare:

'Surely goodness and mercy have followed me all the days of my life.'

Of those countless goodnesses and mercies, your greeting tonight is among the choicest and most prized.

The Washington Fair Dealers have so weakened my underpinning and upset my attic that before I am through I may have to sit down while I finish. Fair Dealers are like lightning bugs, as described by one of the world's best loved poets:

*The lightning bug ain't brilliant,
It hasn't any mind,
It stumbles through the darkness
With its headlight on behind.*

RUNNING FOR OFFICE

My young friends, I assume that none of you has the slightest idea of ever becoming a candidate for public office.

But let me warn you that in these up and coming days, there is a terrific demand by 'friends' that men, young men particularly, become candidates for office.

You may be glad to receive my observations covering a long period on how to win public office in these 'forward-looking,' 'progressive,' streamlined Fair Deal days.

If you have principles, self-respect or courage, get rid of them. They will be of no assistance; in fact, they will handicap your candidacy.

Join all the clubs to which you are financially able to pay dues, especially a Townsend Club. I am informed that every public official in this county is a member of a Townsend Club and that not one of them believes in the Townsend Plan.

Take lessons in rhetoric and elocution to enable you to speak, for an hour, if necessary, without saying anything.

Have your face lifted so that it will wear a smile whether you're awake or asleep.

Take lessons in hand-shaking, back-slapping and kissing babies.

THE ANNOUNCEMENT

Next will come the announcement of your candidacy. It should be short and snappy. It might well run something like this:

My friends, I had hoped and intend-

ed to lead a quiet, dignified, decent life, but pressure from friends that I become a candidate for the office of (dog-catcher or President, as the case may be) has become so terrific I have been forced to yield thereto, to sacrifice myself on my country's altar, and to devote my life to saving you from yourselves.

I am needy. Each of you needs something. I know your needs and how to meet them, having served as Constable for four years, Justice of the Peace for two years and clerk in a hat store for five years. Give me a chance to help myself and I will do my best to help you.

I am against sin and for home, country and God. So are you.

I am against the 'haves' and for the 'have nots.' So are you.

Let us then join hands and march together to victory under a banner inscribed with these glorious words, 'Thee for me—me for thee,' or, translated into modern English, 'You scratch my back and I'll scratch yours.'

THE PLATFORM

Next will come the preparation and publication of your platform.

Political platforms are made to get in on—not to stay on. In announcing yours, state that it is subject to change without notice. Here are some suggested planks for your platform:

MY PLATFORM

Fellow Americans, having consented to become a candidate for (here insert name of office, Dogcatcher to President), I want you to know where I stand, at least for the present:

(1) For amending the Third Commandment to read: four days of five hours each shalt thou labor and do all thy work. But the fifth, sixth and seventh days thou, thy sons and daughters shalt rest, relax, play golf, bridge, bingo, eat, drink and be merry.

(2) For making it a criminal offense for any person under 18 or over 40 to perform any labor, manual or mental.

(3) For a minimum wage of \$3.00 per hour and putting a floor under it.

(4) For doubling prices on all products of farm, factory, forest and mine, and putting a floor under them.

(5) For a 50% reduction in the cost of living and putting a ceiling over it.

(6) For mandating Uncle Sam to buy and burn all surpluses.

(7) For abolishing all taxes except on gross profits of every business, corporation, company, association, partnership or individual, big or little.

(8) Against bigness—big business—big men.

(9) For a perpetual Federal Revolving Fund of one trillion dollars to

(Continued on Page 21)

**Here's the low-cost car
that has everything you want!**

The Styleline De Luxe 2-Door Sedan

Looking for Economy?

Chevrolet has it! Chevrolet's extra values, Chevrolet's exclusive, big-car features offer you more for your money right from the start! *AND* Chevrolet is famous for the thrifty operation of its spirited valve-in-head engines. It's famous for standing up to the pounding of the roughest country roads . . . famous for lower maintenance costs, too! Now take a look at the price tag of this beautiful Chevrolet for '50! Yes, it's the lowest priced line of all!

Looking for Comfort?

Chevrolet has it! Big-Car comfort . . . comfort you'll enjoy throughout the long life of the car. Extra room! Wide "five-foot" seats accommodate three people with room to spare. And the ride? Try Chevrolet and discover what real riding comfort is. S-m-o-o-t-h is the only way to describe it.

Looking for Style?

Chevrolet has it! All the style and luxury of famous Fisher Bodies, built for Chevrolet . . . available only on Chevrolet in the low-price field. Every detail from the graceful, sweeping lines to the smallest of the interior fittings shows smart, up-to-the-minute styling . . . has practical modern beauty that will last for years.

See your Chevrolet dealer today! Take a drive. See for yourself why Chevrolet is America's favorite car!

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

FIRST...and Finest...at Lowest Cost!

Examine all of Chevrolet's big-car features. Then examine Chevrolet's prices—and what a pleasant surprise to learn it's the lowest priced line of all! That's why Chevrolet is America's No. 1 favorite year after year . . . why you'll be better off in every way when you make Chevrolet your choice for extra values!

You see where you're going and you like the way you go there in Chevrolet for '50! The wide curved windshield and generous window area give you vision that's tops for sightseeing . . . tops for safety. You're free to relax and enjoy all the uncrowded luxury of those spacious "five-foot" seats . . . that rich and durable two-tone Fisher interior.

Grades and rutted roads, a problem in your area? Chevrolet for '50 offers you two practical, thrifty solutions—the new 105-h.p. Valve-in-Head engine with Powerglide automatic transmission*, or the standard Valve-in-Head engine with Synchro-Mesh transmission. They're both equal to any road . . . and there's no better way to keep your car upkeep way, way down!

*Combination of Powerglide automatic transmission with 105-h.p. engine optional on De Luxe models at extra cost.

Chevrolet's roomy trunk takes care of your bundles on vacation or shopping trips . . . conveniently pops open at the twist of a key! Center-Point steering with Unitized Knee-Action ride, airplane-type shock absorbers and wider tread assure you a smoother ride on all roads in this longest, heaviest car in the low-price field.

You get a thrill of pleasure every time you see the sleek good looks of your Chevrolet for '50! It's a thrill you'll enjoy for a good many years, too, for Chevrolet has the kind of styling that lasts. Fourteen smart Styleline and Fleetline models—in a wide variety of sparkling color combinations—are offered for your selection.

GEHL
SINCE 1859
PRONOUNCED "GAYL"

Forage Harvester

With own motor and row-crop attachment

With power take-off and hay pickup

RESULTS are what count. Thousands of farmers agree that corn is a natural for the Gehl Forage Harvester... makes better silage in less time with fewer men... silage that cures perfectly, with no air pockets... no spoilage. (User testimonials on request.)

It's the Gehl's clean, uniform cutting that makes the difference. Ask a Gehl owner... he knows. The Gehl Forage Harvester does an equally good job on hay. Simple to operate... built to stand up year after year.

GEHL LEADS... Sells more Forage Harvesters than any other specialized manufacturer.

A 3-Way Harvester. One basic unit takes (1) row-crop attachment for corn, cane, kafir, etc.; (2) hay pickup for windrowed hay or combined straw; (3) mower bar... cuts, chops and loads standing hay crops for grass silage or dehydration.

Powered 2 Ways—own motor or power take-off.

A COMPLETE JOB FROM FIELD TO STORAGE

Gehl Blower elevates fodder to highest silo or mow. Accessory power take-off from blower, or separate electric drive, operate Gehl Self-Unloading Wagon, and others.

Free Plans

for making your own self-unloading wagon box using Gehl Parts Kit.

Lower-Cost

E-Z-GO GUTTER CLEANER

Does It Faster!

Let the E-Z-GO Gutter Cleaner save the messy, time-wasting, back-breaking job of raking out the barn gutter and shovelling manure into the spreader. E-Z-GO is the most compact, dependable, and lowest cost machine available for cleaning the gutter and loading the manure.

In the E-Z-GO machine, the gutter cleaner and the loader are built together as one unit, and are run by one motor located outside your barn. All the scraping mechanism that works inside the barn lies entirely flat in the gutter—no machinery overhead, no reverse tracks through another portion of the barn, no complicated switch gear for back-and-forth movement. The cleaner can work in only one direction—to remove gutter contents towards the spreader outside.

The E-Z-GO Gutter Cleaner is so easy to install that most farmers can put it in themselves; it works in present barn gutters as well as new ones. Why waste valuable time on this disagreeable chore... WRITE Dept. A-5 today for literature.

B. HECKERMAN IRON WORKS

Syracuse, N. Y.

The Question Box

Would it be advisable to sow grass seed with buckwheat?

Buckwheat is usually a poor crop to make grass seedings with. As you know, it is a very effective smother crop for any weeds and, unfortunately, usually affects the grass seeding the same way. Nevertheless, I have seen some fairly successful catches with it.

—G. H. Serviss

I would appreciate your advice with regard to seeding a cover crop on a garden area that is not going to be used this year, but will be used next year.

Usually this is desirable, although if it is not done there will appear a fairly effective cover crop of weeds. Domestic rye grass at the rate of about 15 pounds per acre is one of the best crops for this purpose, providing that it can be mowed to keep it from seeding. If it is not mowed, it is likely to seed very heavily and you may have somewhat of a weed problem with it next year. Another good possibility is a mixture of ladino clover and timothy. Seed about 1½ pounds of ladino per acre and 6 to 8 pounds of timothy.—G. H. Serviss.

I would appreciate all the information you can give me on how to destroy poison ivy and other woody plants.

Poison ivy can be effectively controlled by the use of several chemical weed killers. One of these materials has been on the market for the past few years and has done a good job in eradicating poison ivy. This chemical is made by the DuPont Company under the trade name Ammate. A newer material that will be on the market for the use of eradicating poison ivy is called 2,4-5-T. This chemical is made by a number of chemical companies that will have it available this coming growing season, and probably will be a little less expensive to use than Ammate.

A comparatively inexpensive chemical has been tested for the past three

years and has given good results in controlling poison ivy and the brambles such as wild raspberry and blackberry. This chemical is a mixture of 2,4-D and 2,4-5-T made to emulsify with water or to mix with diesel oil, kerosene or a water-oil mixture. American Chemical Paint Co. in Ambler, Pa., manufactures this material and it is sold under the trade name Weedone Brush Killer 32.

For better kill of poison ivy, spray the plant in midsummer when in full leaf stage rather than applying the material in early spring. Also, from our own experience, wild raspberries, blackberries and Virginia creeper can be effectively eliminated with the use of this chemical called Weedone Brush Killer 32. In spraying brambles the best results have been obtained by waiting until the new shoots are at least 12 to 18 inches high. When this chemical is applied to the brambles at this stage, you can expect a more complete kill. Application requires thorough covering of the leaves and stems of the woody plants with the spray.

The chemical weed killer 2,4-5-T, as mentioned above, has also shown promise in eradicating the brambles and Virginia creeper. Companies that have had experience with 2,4-5-T are the DuPont Company of Wilmington, Delaware; Dow Chemical in Midland, Michigan; and American Chemical Paint Co. in Ambler, Pennsylvania.

—John VanGeluwe

Can frozen potatoes be fed to cows without injuring them?

As near as I can find out, frozen potatoes fed immediately to cows are not particularly injurious or dangerous, but have an even more laxative effect than they would have had before freezing.

I note a great number of our better dairymen are feeding a large quantity of potatoes to their milking herds. Except for the comment that they are losing a little flesh, all are very much satisfied.—F. K. Naegely.

FORAGE HARVESTERS

(Continued from Page 6)

out wilting. It is recommended that at least a full two-plow tractor be used with the power take-off harvester. To satisfy men who want machines that can also be pulled by light tractors, several firms also offer harvesters with their own engines and at least two, the J. I. Case Company and Papec Machine Company, offer an engine attachment that can be added to basic units.

Prices for power take-off harvesters for picking up windrowed crops run from \$850 to about \$1,250. When equipped with a row crop unit or a cutter bar instead of the pick-up attachment, prices vary from less than \$1,100 to around \$1,300. Harvesters may be bought with whatever unit the farmer wants and then other attachments purchased if and when the need for them arises. When purchased separately, pick-up units are from \$185 to \$310; row-crop units, \$221 to \$370; and cutter bar units, \$240 to \$400. All prices are f.o.b. factories and would be higher at the farm, depending on freight.

Models with their own engines vary more in price due largely to the differences in horsepower. They are priced anywhere from \$1,500 to more than \$2,300.

Forage harvesters, whether for putting up grass or corn silage or harvesting either field or mow-cured hay, represent a sizeable investment but one that actually lowers production costs if the machine is kept busy enough days. Many men with too little land

to keep their own machine busy are finding that they can make money doing custom work for neighbors, and the neighbors are finding it cheaper to pay their hire than to hire enough men to put up the forage crops under old systems. Another big advantage, of course, is that rapid handling of crops minimizes loss of food value. Others report that it is cheaper to flue-dry chopped hay than long, and still others use their harvester to field-chop straw after combining, claiming that it is easier to handle in both the barn and through the manure spreader.

FOR QUALITY MILK USE

KLEEN-EZEY THE QUALITY CLEANER - SANITIZER IT HAS —

→ high bacteria kill (including thermobacterics) within one minute in water of any hardness.

→ quick, thorough cleansing

→ deodorizing that eliminates objectionable odors—doesn't merely hide them.

... and all three—sanitizing, cleaning, deodorizing — are performed in one operation. KLEEN-EZEY saves you time, labor and money.

Ayrshire Breeders Elect Dr. Blood

AT the Diamond Jubilee meeting of the Ayrshire Breeders Association at Syracuse, May 5, Dr. Robert Blood, former Governor of New Hampshire, was elected President of the Association. Vice Presidents were elected as follows: Past president R. M. Rodriguez; Henry B. Mosle, Litchfield, Conn.; H. H. Dodge, Frankfort, and John Harnish, Bluffton, Ind. Directors were elected as follows: William Ashton, Edgemont, Pa.; Walter Klaus, Farmington, Minn.; Elias Sellers, Norristown, Pa.; C. J. Knifton, Sterling, Col.; Richard Sears, Grinnell, Ia.; Murray Copenhauer, Nampa, Ia.; Walter Hahn, Frederick, Md., and Jordan Atwood, Orwell, Vt.

At the banquet a Distinguished Service Award was presented to Mrs. Hugh T. Chisolm for Mr. Chisolm, who was unable to be present. He is owner of Strathglass Farm at Port Chester, N. Y. The award is given each year to the man who in the opinion of the committee has done most in service of the Ayrshire breed.

Remarkable Record

J. Leon Atwood of Atwood Orchards, Plattsburg, New York, whose arrival was delayed by an auto accident, received his 7th Constructive Breeder Award for herds between 25 and 50 cows. In production his herd tops all Ayrshire herds in the country.

Fortunately, Leon was not seriously injured in the auto accident. Mrs. Atwood, while hospitalized, is believed to be recovering satisfactorily.

Other northeastern breeders who received Constructive Breeder Awards were: Ardrossan Farms, Ithaca, Pa.; Ralph B. Strassburger, Norristown, Pa.; Wood Ford Farm, Avon, Conn.; Fairdale Farms, Inc., Bennington, Vt.; Windrow Farms, Oxford, Mich.; Kingsland Farm, Sharon, Conn.; Greenrange Farm, Whiting, Vt.; Mrs. Glenn Freeman, Fultonville, N. Y.; Winford Cheesman, Ellenburg Depot, N. Y.

To win a Constructive Breeder Award it is necessary that the major part of the herd be bred by the owner; that a high production standard be maintained, and that the animals have a good type classification. Any breeder who can meet all the qualifications deserves the congratulations of his fellows.

At the recent Northeastern Aberdeen-Angus Show and Sale at Cornell, winners of the ladies' judging contest were: Left, Mrs. Myndert Pangburn of East Aurora, N. Y.; right, Mrs. Jay Keller of Bergen, former lecturer of the New York State Grange. In the junior judging contest, winners in order were: Harold Smith of North Rose; Ralph and Richard Aliak of Williamstown, and Mary Smith of North Rose.

At the sale 63 animals averaged \$502 a head.

Calves like it!

"I've tried other calf foods, and Calf-Kit has proved the most satisfactory... *calves like it*. It looks like milk — nature's food." These comments from Wayne A. Weber, Wauseon, Ohio, are typical of statements made by dairymen all over the country. They find Calf-Kit produces calves equal to those raised on whole milk — helps prevent nutritional scours — improves bone development — and saves you money.

Costs Half as Much as the Milk You Feed!

You don't have to feed 250-500 lbs. of milk or more to raise a "milk-fed" calf. Now you can replace practically all the milk at a big saving—and raise big strong, husky calves, with real milk-fed "bloom" and vitality. Peebles' Calf-Kit does it! Calf-Kit replaces milk safely because it contains 98% milk serum solids, including milk protein, the most valuable protein known for calves. One pound of Peebles' Calf-Kit replaces the nutrients in 8 lbs. of whole milk. See your Calf-Kit dealer now! Try it. See how it produces the finest calves you've ever raised at less cost than ever before!

Calf-Kit can do this kind of job for you

"Good saving with CALF-KIT — a can of milk a day."

D. E. Stotler, Thurmont, Md.

New State Laws Affecting New York Farmers

THE 173rd session of the New York State Legislature produced outstanding results insofar as farmers are concerned. This report aims to present and discuss briefly major accomplishments.

The New York State Conference Board of Farm Organizations, composed of eight major state-wide farm groups, presented twenty-three recommendations in a two hour conference with Governor Dewey on December 27. The recommendations were subsequently presented to every member of Senate and Assembly. A large percentage was enacted into law.

10-YEAR TOWN ROAD PROGRAM, which became Chapt. 824 of the laws of 1950, will enable the towns to go a long distance toward providing a year 'round road for all farms worth farming. Fathered by the Temporary Legislative Commission on Agriculture and vigorously sponsored by the Conference Board, this law provides a means whereby the State will share the cost of improving town roads up to a ceiling cost of \$7,000 per mile. In no case will the State pay less than 25% or more than 75% of the ceiling cost. For the towns as a whole the State will pay about 50%. Under the equalization plan the towns with lower valuation per mile of town highway receive a larger portion from the State.

Town boards have to July 1, 1951, to map their towns and indicate the roads to be improved. The town's plan must be approved by the county board of supervisors and eventually by the State Department of Public Works. Roads must be 16 feet wide with 1 foot of gravel or the equivalent, 5-foot shoulders, sloping banks, adequate drainage, and with hedgerows and sharp banks removed. Construction is to be done by the towns or under contract with outside agencies at the discretion of the town. The \$7,000 per mile ceiling is for actual construction—not for machinery—most towns already have the machinery to do the job.

FARM VEHICLES (machinery, etc.) can now legally be moved on public highways with but few restrictions from sunrise to sunset under Chapt. 316, laws of 1950. This law was drafted by a special committee appointed by Governor Dewey last July when farm organizations vigorously protested in behalf of farmers the permit system which was proving a costly nuisance. The law applies to all farm vehicles not in excess of 13 feet in width, except racks for carrying hay, unthreshed grain, and straw which cannot exceed 8 feet in width at the base but may flare out to 10 feet in width at the top. It is anticipated that the Conference Board will seek to amend this provision in 1951; as it is unrealistic. Any farmer knows that if he loaded hay, straw, etc., 8 feet at the bottom and 10 feet at the top, it would all be in the middle of the highway. However, this is a minor point but it is still a weakness in the vehicle and traffic law.

Under the new law, movement of large farm machinery on highways is prohibited between sunset and sunrise. Such vehicles must display on the left front and rear, red flags 24 inches square. Movement till 10 a.m. on Saturdays, Sundays and holidays is unrestricted. After 10 a.m. on such days trips are limited to two miles. The vehicle and traffic commission is authorized to completely prohibit movement under certain circumstances, such as bottlenecks arising from highway construction and the like.

To protect this privilege farmers should use the shoulders of highways insofar as possible and should extend every possible courtesy to the public. Under no circumstances should children be permitted to move such vehicles along highways, for parents permitting such practices would probably receive

unfavorable consideration by any jury in case of serious accident.

INDEMNITY FOR LOSS BY RABIES—Owners of bovine animals dying of rabies will be paid indemnities not in excess of \$250 for purebreds. Includes beef as well as dairy cattle. Horses, sheep, swine and goats are also eligible for indemnities.

RABIES CONTROL—A new law carries an appropriation of \$60,000 for aid to counties in controlling rabies in wild life. Aid to any one county is limited to \$6,000 and is available only after a program of control has been made by the county and approved by the State. The law is intended to apply to counties where foxes and other animals now have rabies, and to prevent spread to other counties.

STERILITY RESEARCH under a \$50,000 program is now under way in the Agriculture and Veterinary Colleges. \$12,000 was added to the Supplemental Budget to round out the program advocated by the Conference Board.

OLEOMARGARINE became the most heated subject of controversy during the 1950 session. Numerous bills were introduced to remove the color ban. The Conference Board said, "We favor removal of all discriminatory taxes on butter substitutes providing a plan is devised and enforced making it impossible for such substitutes to masquerade in the color and likeness of butter." No such plan was found. All bills were killed. It is still illegal to sell colored oleo in New York State.

GOLDEN NEMATODE of Potato Program is continued. Maximum indemnity per acre is reduced from \$75 to \$60.

TRUCKS hauling fertilizers and soil conditioners no longer need to be registered with the Public Service Commission following enactment of Chapt. 437, laws of 1950.

SUNDAY SALES of vegetables by farmers' markets in all places not over 40,000 in population is now legal. Prior to passage of this act, sales of fruits, flowers, milk and dairy products were legal. Just why vegetables were omitted originally, no one knows.

Announcements in certain parts of the state that the law would be enforced against vegetables in 1950 had sweet corn growers in a dither. The Conference Board took the position that if it is right to market such things as fruits, flowers, milk and dairy prod-

ucts on Sunday, then it is equally right to market vegetables.

JUNIOR LICENSES. Chapt. No. 568 provides that holders of junior operator licenses may not operate a motor vehicle other than to and from school after dark unless accompanied by a duly licensed operator over 18 years of age.

SCHOOL BUSES. Chapt. No. 566 requires that school buses shall have words "School Bus" in black letters on two signs, illuminated at night, on and after July 1, 1951. Lights shall be flashing red.

SCHOOL SUPERINTENDENT'S EXPENSES can be paid by county board of supervisors under Chapt. No. 693.

GRANGE HALLS. Chapt. 448 extends to Grange Halls the definition of place of public assembly for labor law provisions the same exemptions granted churches, state and county fairground buildings, etc. This frees Grange Halls from a lot of costly operations in connection with kitchens, toilets, etc.

OPEN WELLS AND CESSPOOLS, when abandoned, must have suitable protective covering, according to Chapt. No. 397.

OPEN SEASON ON DOE DEER may be declared by conservation commissioner in certain counties where open season has been provided on buck by the Legislature. This applies to central and western parts of state west of eastern boundaries of counties of Broome and Chenango, eastern and northern boundaries of county of Madison, northern boundary of Onondaga and New York Central tracks extending to point where such tracks intersect Oswego County boundary to City of Oswego. To open the season on doe in this area, commissioner must open the season in at least eight counties which need not be contiguous but which may be in two groups of four counties each. The aim of this bill is to reduce deer damage to farm crops, especially fruits.

WOODCHUCKS, STARLINGS, CROWS AND SKUNKS can now be shot under Chapt. 284, laws of 1950, without a license by bonafide employees and immediate members of the employer's family. Employee, to destroy such animals without a license, must have written authorization signed by his employer.

THRUWAY. Chapt. No. 143 creates the New York State Thruway Authority with power to construct, maintain and operate thruway from New York City through Hudson Valley and Mohawk Valley west.

Another bill passed by the Legislature which will have to be passed by another Legislature before it can be voted on by the people would make the State liable for \$500,000,000 bond issue to finance the project. Farm organizations pointed out that such special highway facilities should be paid for by those who use such facilities.

—A.A.—

FOSTER TO RUN NEW YORK STATE FAIR

State Agriculture Commissioner C. Chester Du Mond today named Earl C. Foster as acting director of the New York State Fair. Mr. Foster, who served as the Commissioner's personal representative in producing the 1949 State Fair, will carry on the acting director's responsibilities in addition to his position as Assistant Commissioner of the Department of Agriculture and Markets. The State Fair is a division of that Department.

Simultaneously with the announcement, Commissioner Du Mond said he is accepting the resignation of Bligh A. Dodds as director of the State Fair. Mr. Dodds has been named Executive Secretary of the National Capital Sesquicentennial Commission.

CRAINE-NATCO TILE FOR PERMANENCE AND VALUE

You see them everywhere... the Natco Tile silos which were built thirty years and more ago.

Craine-Natco silos are an outstanding choice today, too. Styles change, but not Natco performance. Each tile unit contains the maximum number of air cells for better insulation. They're glazed for permanent beauty... and they're unharmed by silage acids!

CRAINE'S THE NAME

Write us now for details on the Natco and other silos in the famous Craine line. Prices are lower than you may think. Easy terms available.

8 OZ. TIN 60¢

ODD SMOKEHOUSE

When your field man Mr. Davis called on our farm, we became American Agriculturist members. Mr. Davis was very much interested in our smokehouse which is made of an old chestnut log, so he took the picture of it which I am enclosing. The log is about 3 1/2 feet in diameter and 6 1/2 feet tall. The roof is tin and the entire smoke house is painted red.

—Marie Billings, Stamford, N. Y.

In the Home Garden "Puttering" Pays

By PAUL WORK

THERE is much talk about a late season. Winter has certainly held on, but Bob Sweet had a laboratory section in "Veg. Crops 1," Cornell's general elementary course, in the gardens April 18—about as near average date as you can get. Stanley Warren planted peas in March, too.

Dry Summer

My garden is in a community project, up near the graveyard. It has been plowed but not harrowed so I still have to wait. It is on high ground—high and dry—but last year's experience with a very drouthy summer demonstrated:

1. You can still have a productive garden even though the soil is sandy and the weather does not bring rain.

2. There are several things you can do to alleviate the pangs of drouth even though no water is available.

I should say I had three-quarters of a crop.

Thomas Laxton peas, Swiss chard, beets, radish, sweet corn, tomatoes, cucumbers, muskmelons, bush and pole beans, and volunteer pumpkins did well. There was a 10-inch pumpkin to eat by July 16. Carrots and lettuce and spinach were not so good. Maggots did great damage to broccoli and early cabbage—I'll watch them closer this time—calomel and water at the roots. Warba potatoes were just fair. And gladioli came through in fine shape, making fine flowers and good bulbs.

Fighting Drouth

Two tricks proved helpful in combatting dry soil. A mulch of pine needles from the nearby grove kept weeds down, kept tomatoes clean and probably conserved moisture. Hay or straw serves well, spread between rows before plants begin to spread. It works for any crop but is especially good for the ones that spread over the ground and make cultivation, or even hoeing, difficult or impossible. A mulch keeps fruits clean and reduces damage by slugs and insects. Also, if soil gets muddy, it makes better walking to pick the products! But don't mulch soil too early in the season. It may delay warming up of the soil. Mid-June should be o.k. in most places.

The other trick, when sowing seed in dry weather, is to make the furrow a bit deep. Give it an even bottom with the back of a level-back rake. Then cover only 1/4 to 1/2 inch, and tamp or tramp the row very firmly. This gets the seed closer to moist soil. It's amazing how dry a soil will yield moisture enough to germinate seed. I had good luck, too, putting water in the little furrow after covering the seed. A couple of sprinkling cans full went quite a way, moistening the soil where the seeds are and making a puddling contact between seed and soil. If rain comes and the soil crusts up after-

ward, just break it up before the seedlings come up by tamping gently with the teeth of a rake.

I hear someone say—"Oh yes, that's all right for you to putter and fuss over the garden. I can't give it the time." OK, then, don't do it. But any worthwhile enterprise demands attention to fine points and details—even tending 60 cows. And not many enterprises pay more per hour of the worker's time than the home garden.

Weeds were not very troublesome in 1949. A low-built wheel hoe with blades, a little hoeing and a very little hand work kept them under control. My diary shows but 30 hours' work on the 40x50 foot garden in May, June and July. I'll grant I should have worked more. (I say this just to curb the impulse of my neighbors to write to A.A. "Yes and you should have seen his garden.") But even so, the labor demand of a garden is small, especially if one catches the weeds when they are small.

Other Tricks—Good and Not so Good

We have tried Wando peas for two years and there seems little doubt that they stand heat and drouth better than others. They can be planted up to July 1. A good many gardeners have tried them and report success with them as a mid-summer crop.

Coated seed (sometimes wrongly called pelleted seed) did not do well. Nor do we find much encouragement for its use in home gardening in our reports from others. The idea seems grand but there appear to be a number of unsolved problems, even for commercial planters.

Cornell's bulletin "The Vegetable Garden" has been revised and is on the press. It should be available when you read this. It is Cornell Extension Bulletin No. 696 by Art Pratt, R. W. Leiby and Charles Chupp. It answers a whole lot of questions including bugs and diseases. Write for it to *American Agriculturist*, Ithaca, N. Y.

— A.A. —

KEEP A SHARP HOE

IF YOU HAD the time and interest to examine 100 hoes as they are being used in gardens, I doubt if you would find 10 that are sharp. Yet the difference in the effort required to use a dull hoe compared to one that is sharp is great, and the results you get vary in the same degree.

With a heavy file in reasonably good condition, it takes but a minute to change a dull hoe into a sharp one. Do the filing on the back of the hoe. Then you will find that you can easily cut weeds just below the surface of the ground. Little effort is required and you will not be destroying the roots of the vegetables.

NEW 2-WAY LIGHTNING PROTECTION

For Farm Buildings. Lightning never has destroyed any building fully protected by Security System. It protects against new dangers from water piping, air ducts, etc. New low points, almost invisible. Most durable materials, all UL approved.

For Electrical Appliances. Unlike ordinary arresters, Green Guard holds lightning surges to less than line voltage. Prevents damage to ranges, water heaters, motors, switches. Send for full story. Security Mfg. & Contracting Co., Burlington 34, Wis.

SECURITY

LIGHTNING PROTECTION IN THE MODERN MANNER

BE SATISFIED

In remodeling or repairing your home be sure to use reliable equipment and good materials. Patronize American Agriculturist advertisers and you will be satisfied.

"It's Handy"

MOTOR DRILL CHUCK

Here is my way of making a very convenient motor drill. Remove the chuck from a discarded hand bit brace, buy a half-inch shaft coupling for around thirty cents, and with it connect the chuck to the shaft of a motor.

It works best by holding the motor perpendicular to your work and applying what little pressure is needed according to the work. Some firms make a simple drill stand for mounting a small motor, or the work can be clamped to a sliding table and held against the drill with the motor horizontal.

—I. W. Dickerson

—A.A.—

CHEAP WATER TROUGH

If you have an old wide rim from a tractor wheel, pour a level piece of concrete and press the rim down into it while still fresh, and you will have an excellent water trough. Be sure to reinforce the concrete with woven wire fencing so it will not crack. Any cracks which do happen can be stopped with roofing putty.—I. W. Dickerson.

—A.A.—

IMPROVED OIL CAN

To solve the problem of lubricating out-of-the-way places, I put the spout of the oil can through a cork and stick a small wire in the cork so that it touches the end of the spout. Drops of oil run along the wire which can easily be bent to reach different places.

—I. W. Dickerson

—A.A.—

A Slight Hint

I am a hired man of C. V. Woods of Friendship, N. Y. He owns another place a short distance from where he lives. One day I suggested to him that I haul some manure up to the other place, but he said this was too hard on the rear spreader wheels and that they would wear out soon. The road leading to the other farm is paved and would be rather hard on the wheels, so I sug-

gested to him that I take some old automobile tires and cut the bead from the inside and then slip the old tire on the rear spreader wheels and wire them on to the spokes. In that way the tires would keep the snow off and the wheels wouldn't wear out. This idea has proved to be very worth while for us.—W. W. Kottwitz, R.D. No. 1, Friendship, N. Y.

—A.A.—

MOUSE AND RAT TRAP

Here is my way of making a very satisfactory mouse and rat exterminator which has the advantage of resetting itself after each capture. Take a three or four-gallon stone jar or other container and cut a tin or plywood disc which will fit loosely inside the opening. Fasten this as shown to a straight wire at the middle so it will hang level but will tip whenever any

weight is put on it. Now fasten a bait at the middle so it will not come off when the cover tips. Lean a board up against the jar for the mouse to climb up and you will soon catch all the mice and rats around. It will be better if the mouse cannot quite reach the cover but has to jump a little to get on it. Brine will have to be used in cold weather.—I. W. Dickerson.

—A.A.—

LIVE CORN SHELLER

All the grain our 1,500 December 1st pullets have had has been whole corn. We handled it just three times from the stalk to the birds: once when we shoveled it off the wagon; once when we shoveled it into a bag, and once when we dumped it into the pens. The chickens learned to shell it at the age of six weeks. They have more time and do a better job than we do and besides, it is a lot easier.—Francis J. Townsend, Cazenovia, N. Y.

STEP-SAVING ELECTRIC FENCE

I save myself a lot of steps by using the following arrangement on my electric fence. By the use of an extra few feet of wire I bring all my fence leads to one central point instead of continuing from one pasture to another. By feeding two double branch blocks (ordinarily used in house wiring) with the fence charger, I get four circuits which,

in turn, feed four independent fence lines. Each circuit is fused with a 10 amp fuse. When the blinker stops to signify a short, all I do is unscrew the fuses to find which line the short is on. As soon as the shorted line is unfused the blinker will work on the other three.—Ralph P. Rignall, Wilson, N. Y.

MINRALTONE HELPS BUILD CHAMPIONS

Say you saw it in AMERICAN AGRICULTURIST

A FORUM FOR Backyard Gardeners

A FRIEND asks how he should trim his forsythia hedge. The time to do it is right after the blossoming season. Don't try to cut a branch here and there, but go right down to the base of the bush, use a pruner heavy enough so that it will cut through a good-sized stem and take out half or more of the oldest bushes. Where soil is fertile, forsythia grows rapidly. If it gets out of hand you can even cut it right to the ground, and in a couple of years it will be as rank as ever.

How Much Plant Food

Occasionally village friends complain about college bulletins and say that information about fertilizer, sprays, etc., gives figures which cannot be applied to a home garden. For fertilizer a good rule is to use 4 or 5 pounds of 5-10-5 fertilizer to each 100 square feet of garden area. One way to handle it is to broadcast half before the garden is plowed, and use the other half in the row. Particularly with some vegetables, it is not a good idea to have the fertilizer touch the seed; therefore, stretch your string to mark the row, make a furrow for the seed and another close to it for the fertilizer. Use about 2 pounds for each 50 foot row.

A bushel of manure for 50 to 75 square feet of garden is equivalent to 20 tons to the acre.

PERENNIALS. Here's a question that is commonly asked by everyone who grows perennials:

"Our perennial bed seems to be running out. The blooms are smaller and we are having trouble in keeping grass under control. Have you any suggestions?"

Most perennial beds get entirely too thick within a few years. It is essential to dig up plants which spread, such as phlox, iris and many others. Divide them and reset a part of each clump. Don't pare off the clump all the way around, because if you do you are leaving the older part rather than growth that is new and vigorous. Usually you can split a clump into 4 parts, re-plant one quarter, and throw the rest away or give them to a friend. Grass is a perennial problem. It takes work to keep the grass from between your clumps of flowers, and if it gets established in the clump the only way to eradicate it is to dig up the clumps, knock the dirt off the roots and separate the roots to the point where you can remove every trace of grass roots.

BORERS. Borers which eat the roots of iris are one of the handicaps of growing that flower. If any subscriber has an easy way of controlling them, we would like to hear about it and will pass it along to readers. The usual way is to keep the planting young by digging up the clumps, removing the roots that have been eaten by borers and re-planting those that are free of borers. Incidentally, if your iris is restricted to the common blue variety, you may want to look over your catalogs and buy a few of the newer ones. With care they should multiply so that you will soon have a variety of blooms.

Lupines

The question whether lupines can be grown from seed was recently asked. A friend relates his experience in saving seeds, putting them in a row in the garden early in the spring and finding that a sufficient number grew so that he had several plants to put into his perennial garden in the fall. 2,4-D. Much has been said about the

wonderful results from use of 2,4-D in controlling weeds. The results are wonderful, but the home gardener needs to use considerable caution. If a sprayer which delivers a fine spray is used, for example, to spray the dandelions in your lawn, you may find serious damage to your shrubs if the wind carries this spray to your ornamentals.

On farm crops the directions are stated so that a rather definite amount of 2,4-D will be applied per acre. You can buy a very small can of any one of several weed killers for home gardens and it will carry directions for use. Here's an idea that you might try on your lawn. Instead of using a hand sprayer, do a bit of figuring and dilute the spray to the point where you can apply it with an old garden sprinkling can, and thus avoid the possibility of drift onto your ornamentals. Don't use the same can for watering your garden!

Water Your Garden!

One of the mistakes often made either with vegetable gardens or flower gardens is to use a hose frequently to sprinkle the garden sparingly. Such procedure does more harm than good.

If plants show signs of lack of moisture, and if you have water available, soak the garden thoroughly once a week. You can always see how deep the water is penetrating by doing a little digging, and unless the water penetrates several inches you get little benefit. One soaking is worth a dozen sprinklings.

Renewing Strawberry Bed

The backyard gardener may have room for a few strawberries, but scarcely enough that he can plant a new bed every year. Doing that takes two plots rather than one, so there is always the temptation to renew the old bed and keep it producing as long as possible.

Under certain conditions this can be done. However, the first requirement is to keep grass out of the strawberry bed, and the second is to go over it drastically as soon as the harvest is completed. Go into the bed with a good sharp hoe and take out at least nine-tenths of the plants. Because the plants will miss the good growing weather in May and June, you might leave twice as many plants as you normally would set out in a new bed. At the same time put on a good application of a commercial fertilizer so that the plants you leave will have food to produce new runners and new plants.

Letters

If you have gardening experiences you would like to share with others or questions you would like to ask, *American Agriculturist*, Box 367, Ithaca, N. Y., will be more than glad to hear from you.

GIVE TOMATOES ROOM

In growing tomatoes for market or as a canning crop, you get the best yields by allowing about 16 square feet per plant, which will require 2,722 plants per acre.

A good way to do this is to make the rows 5 to 5½ feet apart and set plants from 3 to 3½ feet apart in a row.

— A. A. —

Strawberries rank high, along with citrus fruits and tomatoes, as a good source of vitamin C.

WE GUARANTEE YOU'LL PICK THESE EVERBEARING STRAWBERRIES IN 90 DAYS

FAMOUS GEM EVERBEARING. Stern's takes the risk out of gardening. You'll pick these big juicy strawberries by August—or your money back! Every plant unconditionally guaranteed to bear—will start by July and continue bearing until freezing weather. Big, firm, round berries. Extra juicy, extra rich flavor, very sweet. Make mouth-watering short-cakes, pies, jam, irresistible with cream. Next year and after they'll bear earliest and continue right up to freezing time.

GEM EVERBEARING Selected highest quality Thick heavy roots	50 for \$3.00	250 for \$12.00	1,000 for \$30.00	POSTPAID Fresh plants shipped from fields closest to your home.	Thousands of feeders on thick fibrous roots. Stern's plants pro- duce fast, heavy crops.

Wonderful Success Raising Baby Chicks

Mrs. Rhoades' letter will be of utmost interest to poultry raisers. Read her experience: "Dear Sir: I think I must be one of the very first to use Walko Tablets. Some 35 years ago when I started raising chicks I saw Walko Tablets advertised as an aid in preventing the spread of disease through contaminated drinking water. I tried a package for my baby chicks with happiest results. I have depended upon Walko Tablets ever since." Mrs. Ethel Rhoades, Shenandoah, Iowa.

Danger of Disease Among Baby Chicks

Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your flock before you are aware. Use preventive methods — use Walko Tablets. For over forty years thousands of poultry raisers have depended upon them. You, too, can rely on Walko Tablets as a valuable antiseptic to aid in preventing the spread of disease through contaminated drinking water.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

Walker Remedy Co. Waterloo, Iowa

SURPLUS CHICKS \$8.00-100 COD

Use Capettes and Make Cockerels Into Capons

By L. E. Weaver

THE MORE I hear about capettes, or caponettes, the more convinced I become that here is something that is really revolutionary. I believe that as soon as the housewives of the country and their families once learn about these chickens, the demand for them will be sufficient to use up all the heavy-breed cockerel chicks that are hatched. Perhaps Leghorn cockerels also may be made into satisfactory capettes, but I haven't had any reports on Leghorns.

When it was first announced by Dr. F. W. Lorenz of the University of California that by implanting a pellet containing the female sex hormone diethylstilbestrol under the skin high up in the neck of a rooster, he soon loses most of his masculine traits and appearance and takes on weight much as a capon does, one of the investigators at Cornell obtained some of the pellets and treated a few tough old roosters. Soon they stopped crowing, combs and wattles lost their bright red color and shriveled down to less than half their normal size. In about 4 weeks the roosters became plumper and heavier because of the fat that they took on rapidly.

We Tried Them

The next step was to test the tenderness of the meat. Co-operators in the College of Home Economics roasted some of the treated roosters, both Leghorns and Barred Rocks, and for each treated bird an untreated one of the same age and variety was also prepared. Then liberal samples from each roasted chicken were placed on numbered plates, and a dozen or more of us tasted each sample and wrote our opinion of its flavor and tenderness, not knowing whether a given sample was from a treated or non-treated male. Then we voted our preferences by number. The results left no doubt about the effectiveness of the pellets. Both the flavor and quality of the meat were noticeably improved.

Since that time it has been found that when young males of 4 to 5 pounds are treated, the effect is just

as pronounced as in those old staggy birds. To all appearances and effect, the cockerels become capons. Their masculinity is overwhelmed by the feminizing influence of the female hormone. They put on fat, but not in big gobs in a few places. It is distributed evenly through the muscle tissues, making them juicy and very tender.

Of course many questions were raised about this idea of producing capons by the use of chemicals. Was it safe for people to eat them? What is it going to cost? Where can you get the pellets? Is the effect permanent?

A lot of tests have been run and most of the answers are ready now. There is no danger to the people who eat the treated chickens, and no ill effects have been reported. However, the pellet should be implanted far enough up on the neck so that any unabsorbed remnant of it will be thrown away with the head. The effect is not lasting. If you don't dress off your capettes when they are ready, they will gradually regain their masculine ways and appearance; and a second treatment does not succeed like the first one. A number of simple, low-cost implanting instruments are now being distributed by poultry supply companies, along with the pellets themselves. The cost is a small item.

Winning Customers

At the State Institute of Agriculture at Morrisville, Mr. McPherson and his poultry students have been working with the hormone pellets. Mr. McPherson gave a brief but enthusiastic report of their experience at the Poultry Exposition staged in Syracuse by the County Farm Bureau. He said that once their customers got a taste of the capettes, they came clamoring for more.

In much the same vein a mid-western dealer has written of the hesitating way in which housewives consented to try capettes. They didn't like their looks. They were different from the roosters that they had been getting. But once, when there were no roosters,

(Continued on Opposite Page)

Pennsylvania Has World's Largest Henhouse

M. Earl Mack and T. Ray Mack, brothers and poultry farmers of West Sunbury, Pa., believed that efficiency goes with size. Confident that their theory was right, they built the world's largest chicken house. The building is 360 feet long, 60 feet wide and four stories high. It holds 22,500 chickens, 7,500 on each of three floors. The fourth floor is used for storage.

To provide adequate light and ventilation, rows of windows run the entire length of the building. Construction was of wood, native oak for framing and yellow pine for siding. Because

the Mack brothers realized the necessity for full protection against the weather and against fire, they chose fire-resistant asphalt roofing for the roof. The roofing color selected was red—the standard color for all roofs on the farm.

Every step in the routine of caring for the 22,500 chickens in the "egg factory" has been simplified. Watering is automatic. Mechanization enables feeding and egg-collecting to be done in minimum time. The Macks' methods are as smoothly streamlined as their chickens' eggs.

BABCOCK'S Healthy Chicks MAKE GREAT LAYERS

Last year ('48-49) our White Leghorns won as follows at the official egg laying tests: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird) for high average production all breeders in U. S. competing. This is highest average ever made. 6. We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND
We hatch White Leghorns, Red-Rock Cross, Rhode Island Reds, and Barred Rocks all year... own two hatcheries, with 530,000 egg capacity—three poultry farms and 15,000 breeders. We also carry on a complete pedigree-progeny testing program.

FOR INDEPENDENCE

TOMORROW

(Continued from Opposite Page)

the women took the capettes. Presto, they suddenly decided that they wanted nothing else, only capettes.

I have not heard much about "chemical caponizing" of old males. Perhaps there are too few of them to bother with. However, capettes have become so well known in some markets that a daily price quotation is made. As you would expect, the price is higher than for untreated cockerels (roasters) of the same age, but slightly lower than that of capons.

Where can the pellets and implanter be obtained? Look in the advertising sections of poultry magazines and farm papers. If you get the pellets and treat some cockerels, be sure to leave a few untreated and then compare them with the treated birds for weight, tenderness and flavor. Remember also that you will have to do some selling before you can cash in on this new and superior type of chicken. We all pass up good bets constantly simply because no one has told us about them. You will have to tell your customers in order to sell them.

Brooding with a Heat Lamp

OF THE 100,000 persons who were keeping chickens in New York state when the census was taken in 1940, 79,000 had fewer than one hundred chickens. A large share of that 79,000, I expect, had back-yard flocks of only one or two dozen hens. No doubt today many of these small-scale poultry keepers buy their pullets all grown and ready to lay. Others purchase started-pullets old enough that they can be grown to maturity without the benefit of a brooder. And there are some who "get a big kick" out of starting a bunch of baby chicks and growing them into pullets for their laying pen.

If I were planning to start any num-

ber of chicks up to 30, I would not bother with any hover or hot water bottle or other substitute device for the mother hen. I would just use an electric heat lamp, being sure that the floor was free of drafts and the room rat-proof even when the window was open for ventilation.

Brooding small lots of chicks with heat lamps was tried out several years ago by quite a few people (four that I recall) and, as far as I know, it proved satisfactory in every instance. I have wondered why the practice has not become more common. Perhaps it is being used and I just don't know about it.

The heat bulb is screwed into a socket on the end of a drop cord and suspended above the chicks at such a level that all the chicks can spread out in a circle, heads pointing out, with a vacant spot about 6 or 8 inches in diameter directly beneath the lamp where the heat is just a little too high for the comfort of the chicks. Raising the lamp widens the area of warmth and comfort and lowers the temperature. Of course that is exactly what is needed as the chicks become older and larger.

I set a limit of 30 chicks under one lamp, but I am assured by one man that he successfully brooded 75 under one lamp. That was probably late enough in the spring so that the room temperature never went very low.

The Poultryman's Question Box

Kindly advise me on what is the right amount of scratch grain to give baby chicks from the start to maturity; also, laying hens. What is the best time of day to give it?

I note that you are now feeding no grain to your chicks until the fifth week. That is about as I would suggest that you do. Perhaps you could even wait another week or two before you start feeding grain.

You may or may not be familiar with the fact that many people regularly start their baby chicks on chick grain as their first feed and continue to feed it for two or three days because it has been shown that in this way it is usually possible to prevent the "pasting up" of the chicks. We at Cornell, however, do not recommend this practice and there are two reasons: One is that we have found that even though some of the chicks became "pasted up," they do not die and eventually cannot be told from the other chicks and, in the second place, we know that starting the chicks on grain retards their growth rate during that period. Therefore, if you are growing broilers, it would be a definite handicap to start the chicks with

grain.

The feeding of chicks is discussed in Cornell bulletin No. 153 beginning at page 20. In brief, it is suggested that the feeding of grain be started at 6 to 8 weeks, and that, until the twelfth week, equal amounts of grain and mash be fed. After that, both grain and mash are kept in feeders at all times and the growing pullets are allowed to make their own choice. Most feed manufacturers have variations of these rules in their feeding instructions and it is best to follow their instructions.

"Methods of Feeding Laying Hens" is an 8-page bulletin from Cornell. Four methods are described in it: (1) the free-choice or "cafeteria" plan; (2) restricted grain plan—litter fed; (3) restricted grain plan—trough fed; (4) all-mash plan.

Poultrymen are obtaining satisfactory results with all of these methods. Numbers 2 and 3 are most commonly used, and the use of pellets has become common with all methods.—L.E.W.

—A.A.—

EGG GRADING SCHOOL

The 19th NEPPCO Egg Grading and Marketing School is scheduled to be held June 20 to 23. The place is the Rhode Island State College at Kingston, R. I.

There is a long list of recognized experts for administration and instruction. The school has been going long enough so that it has become accepted as filling a definite need. Any reader who is interested can get complete details from Alfred Van Wagenen, Northeastern Poultry Producers Council, 11 West State St., Trenton 8, N. J.

—A.A.—

MY EXPERIENCE WITH ROADSIDE MARKETING

(Continued from Page 9)

products they sell and who like to meet people can be successful in this type of selling. Cheerfulness under all circumstances is essential and it will pay cash in pocket to listen interestedly to any and every one's troubles but never to mention one's own.

I would like to relate a story which illustrates the importance of cheerfulness and full application of the golden rule. We had a well-to-do customer from some distance who, with her companion, big car and chauffeur, had been coming to our market for several years. One day she asked, "Do you know why we come here to shop with you?" I said, "I presume you must get hungry." "No," she replied, "we come to be entertained and always feel better when we leave."

This does not mean a farmer need employ an orchestra for the amusement of his customers but it does mean that he will find general interest and good humor will pay big dividends.

A good reputation has to be earned; once attained it is priceless. Business is very competitive and success is obtained only by those willing to pay the price. One need hardly figure on getting more out than he puts in. Life is not made that way.

AUCTIONEERING

WRITE for rates and open dates. Our method of selling covers all sales. Go anywhere. Two auctioneers. L. L. Smith, Charlestown, N. H.

By J. F. ("Doc") ROBERTS

HAVE YOU continued to watch the market go up since the government repudiated price supports for hogs? Under free enterprise and without fear of government meddling, hogs that were bringing around 16 cents are now bringing around 18 cents.

About 5,000,000 hogs are marketed in an average month. This means that over 20 million more dollars have gone back on our farms for hogs alone in the last month, or since hog price supports were turned down.

All other classes of livestock have gone up along with hogs. Whether or not this is because of confidence in hog prices will always be an open question. It does seem fair to say, though, that if beef processors are not afraid any longer of cheap pork prices undermining their beef prices, their confidence makes them active buyers for live cattle even at higher prices. Where confidence replaces fear, we always have improved prices.

Blaming Farmers

In this life there's always a fly ready to jump into the butter. Retail meat prices are jumping up 10 to 20 cents a pound. This is unwarranted and unjustified. Retail dealers' costs for meat have not advanced over 5 cents a pound as a whole. If their operating costs were taken care of by prices of 30 days ago, then there is no excuse for that much advance in meat prices.

Already newspaper reports are blaming higher meat prices on farmers, claiming they are holding back their livestock. This always can be put down as pure propaganda. No farmer has the necessary information to gamble that way, especially at present grain prices. When his livestock is ready for market he must market it. If he doesn't, he is heading for a sure breakup. This has been true so often that the good livestock man has made it a hard and fast rule.

Many people in the livestock industry think that government figures have been so far wrong again on available supply of both hogs and cattle that we are facing shortages instead of surpluses. This could be true except perhaps for a short while later this spring when pigs farrowed last fall come to market in numbers.

Dairy cow and heifer estimates can be very wrong, too. Right now, good dairy heifers are bringing from 20 to 23 cents for meat. In other words, a 1000-pound heifer in good flesh will bring \$200 to \$230 to kill, and many of them are being killed.

Sell Poor Heifers

Normally, I would want to discourage this reduction in heifer numbers, but not now. I think if every dairy farmer would grade out his prospectively poorer producing heifers—yes, grade deeply—he would not only be helping himself but the future price of his dairy cows and the future milk price as well. I also feel that he must act quickly.

I have not seen so many "grass crazy" people this spring as usual. Either this is because prices are so high anyway that it is discouraging to buy animals to put on grass, or else most Northeast farmers have animals enough for their grass. Whichever it is, it is a good sign that the average farmer is not letting these higher prices get him off balance. This is not true except here in the Northeast. The

West, Southwest and Midwest have gone all out for livestock numbers at prices radically higher.

This is another compliment to our steady, sturdy Northeast farmer.

A Visit With the Editor

(Continued from Page 10)

throw off a monthly pension of \$200 to every person over 40 years of age.

THE CAMPAIGN

Having announced your candidacy and presented your platform, you should immediately open your campaign.

Here are some 'musts':
Never say 'No.'

Agree, always, with the person with whom you are talking—pretend to be for what he is for—against what he is against.

Go with the crowd. You have an historic example of the wisdom of so doing. Pilate said, 'I find no fault in Him.' The crowd said, 'Away with Him, crucify Him.'

By going with the crowd, Pilate kept his office and his head. Had he done otherwise, he might have lost both.

Watch the tin roosters on the political outhouses to see which way the wind is blowing and be ready to shift with the roosters.

Devote your time to ringing doorbells, slapping backs and kissing babies.

THE RESULT

After winning the office (as you will if you follow this blueprint), and as soon as you get your office chair warmed, go out and buy a cemetery lot; arrange to be interred therein; erect a monument thereon with this inscription:

'In Memory Of'—followed by your name, and this epitaph:

'In Life He Lied and Here He Lies.'

That will be a full and fitting biography of your life, your work and your worth.

Do I hear you say the principles and policies I have outlined are unsound and unsafe?

They are. But they are the principles, policies and methods on which the government is being operated today.

If continued, they will wreck the Republic and destroy individual liberty.

TODAY'S ISSUE

The question which confronts us today is: Will we follow the principles and policies enunciated and practiced by the prophets and the statesmen of the past—walk in the paths of the founders of our Republic—or will we follow the New Dealers, Fair Dealers, Double-dealers, down the path to the Welfare State and Socialism?

— A. A. —

BUY BONDS

From May 15 to July 4, U. S. Savings Bonds will be offered in an "Independence Drive."

The symbol of this drive will be the Liberty Bell, and emphasis will be put on the idea of saving for independence. Farmers recognize the soundness of saving for future needs.

Say you saw it in AMERICAN AGRICULTURIST

THE YOUTH'S COMPANION

Bill Gates and The Schooner "Belle Queen"

By JOHN R. SPEARS

SYNOPSIS: Young Billy Gates wanted to be a sailor. Instead of studying lessons he built boats without proper tools or suitable lumber. But they attracted Captain Lanphere's attention and Billy was given a job on a Great Lakes freighter.

On a dark night a collision with another freighter seems inevitable.

PART II

THE huge black hulk of a steamer came out of the mist not three lengths away, towering above the little schooner like the shadow of death. The second mate had made a mistake, and the Belle Queen was lying helpless in her path. If the steamer had been blowing her whistle, no one on the schooner had heard it before she was seen; but now its hoarse roar only added to the terrors of the disaster as she bore down on the unfortunate craft which she was plainly bound to strike on the starboard quarter.

At the first hail Captain Lanphere came on deck. He saw the situation at once, and shouted:

"Forward, men, for your lives!" Every man but Bill clambered over the lumber in a wild scramble for safety. As for the boy, he had been told to put the wheel hard-a-port, and hard-a-port it must go.

As he worked at the spokes, there was a shout and a commotion on the deck of the steamer that was answered by the yells of the schooner's crew, and then with an awful crash the steamer struck the schooner. Bill was thrown across the deck by the whirling of the wheel.

For a moment the schooner heeled to port until her rail was out of sight. The deck-load of lumber slid off into the water, carrying all the men with it. The schooner, eased of the pressure of the helm and this weight, forged ahead, and the steamer swept past, and was lost to sight in the thickening fog.

It was all over in a minute, but when Bill had picked himself up from the deck there was not a glimmer of the steamship or the deck-load of lumber to be seen, though the shouts of the schooner's crew clinging to the floating planks could be heard plainly.

The first thought of the boy was of the effect of the collision on the schooner, and he ran to the broken rail to starboard, and gazed over the side. It was so dark that he could see little, yet it seemed to him that she had received no more than a glancing blow, from the bluff of the steamer's bow. It had "made basket-work," to use the sailor phrase, of the schooner's counter, but so far as he could see there was no very large hole that reached down under water. She was sure, in any event, to be a long time filling.

As this came to the boy's mind, he remembered that she was laden with pine lumber, and could not sink even if full of water. The idea that this thought suggested set his brain on fire.

He would stay by the schooner, and sail her into Buffalo single-handed.

He turned hastily to look off astern. He could see the steamer lights faintly. She was coming slowly back, and put

out boats to pick up the men. She would come to the Belle Queen and take him off, and leave the schooner to be wrecked on the shore.

He thought he could save her, and in his stolid way, without thought of danger; he made up his mind to try.

The booms were flying to and fro across the deck, and the wheel was whirling, for the schooner was almost up in the wind. No matter. He must get away forward, and flatten aft the jib—get it to windward if possible.

It was a hard pull, but the boy worked with a will and succeeded. The flat-bottomed little vessel moved like a top to the impulse of the wind.

Now aft to the wheel, and take a look at the compass.

"Whoop!" said Bill, now greatly excited. She would lay her course already, for the wind was still canting to the southward. Away forward again, and let the jibs down to leeward!

By the time it was done, and the boy was aft at the wheel again, the fore and the mainsails were drawing, and the Belle Queen, lightened of her deck-load, leaped to the impulse of the wind, and headed once more for Buffalo.

Bill turned to look astern. He thought it was lucky he was not taken off by the steamer, but after a little the excitement wore off. Then he began to realize where he was, and what was before him.

Turning his head once more he gazed into the night, where he had last seen the steamer's lights. They had disappeared. He began to feel depressed.

Turning forward, a dash of icy spray carried on a gust of wind caught him full in the face. He cowered under the blow.

Then he thought of the wound in the counter. Securing the wheel, he crept to the rail and peered over the side of the schooner. As he did so, her stern rolled low in the trough of the sea, and the open seams sank out of sight under water. The schooner was surely filling, he thought.

The wind was increasing slowly. Strained by the collision, the vessel might be torn to pieces by the violence of the gale. He might not be able to keep her to her course, and she would then drive ashore where he would have no hope.

He was alone on a wreck; he had thrown away his chance of rescue, now he must face the probability of an awful death.

Bill was only a boy. He had been half-wild in his ambitious enthusiasm, but now the reaction had come.

There were other ills, too, for him to face than the fear of death. He had gone to the wheel at eight o'clock feeling fresh enough, but now he was tired from work and excitement. The weather had grown colder. Snow was driving along on the wings of the gale where mist had been flying before, and the flakes struck his face sharply. He was wet to the skin, and his outer garments soon were glazed with ice.

For ten long hours, should the schooner float so long, he must stand at that wheel before even daylight would come to cheer him.

How those hours passed he has never been able to tell. But daylight did come at last. It found him almost dead with exhaustion and cold, but still standing at the wheel.

Somehow the light revived him, and he realized that he was terribly hungry. Securing the wheel, he dashed into the galley. There lay a big piece of boiled beef and a loaf of bread, with the teapot still standing where it had been left by the cook. Catching up these he ran on deck again, and placing them on the top of the cabin, helped himself to his food and drink with one hand while he steered with the other.

Nothing revives a tired boy like a hasty meal. Bill was soon gazing about more hopefully. He noticed then that the wind was aft on the quarter, so he secured the wheel and ran forward to ease off the sheets.

This made the schooner jump. Bill could see that she had taken in much water, but she was still able to make good speed, with that wind to drive her.

This set him to speculating as to the whereabouts of the schooner. She might even be abreast of Long Point, he thought. No land was visible, but he was sure she had had a fine run, and he had held her on her course. If he were so far along as that, the big elevators of Buffalo would loom up through the snow before dark.

This was a cheering thought. It served to help him pass the greater part of the day.

During the afternoon the wind increased, but the vessel did not gain in speed. This made him anxious about the safety of the masts. But there was nothing for him to do but hold on as he was, and look and pray for a sight of the Buffalo elevators.

But the night drew on, and no elevators appeared. The weather was so thick that he could not see the land if it had been in sight, and he could not tell where he was. He was likely to run ashore at any time.

He became more depressed than ever. He was almost exhausted for want of rest and sleep. Could he stand at the wheel another night?

He thought not. But he could and he would stand there till he dropped. Remembering the old days when everybody had thought him a fool, he resolved that if ever the vessel was seen by any one again, he would be found by the wheel, dead or alive.

Then night fell, and once more he found himself facing the gloom that had filled him with terror the night before. He nerved himself as best he could to stand to his post; but his thoughts wandered and somehow he began to feel as if he were suffering less from the pains that had racked him during the day. He was even becoming easy in mind and body. His thoughts seemed to carry him in reality to the place to which they wandered.

But just as he began to feel delighted with this, he realized that these feelings were due to the influence of a sleep that could end only in death. By a mighty effort he would rouse himself, only to doze away again a few minutes later.

Men on shipboard sometimes fall asleep standing, and in the face of danger. The lad was doing worse than that, for he was suffering from the cold

THEY GOT WATER!

(Continued from Page 1)

At the dinner table (the drillers board with the family when they are on the job, which usually lasts two to three weeks) Mr. Young showed them some catalogs he had gotten at the village store. There was one of the 50 gallon tank for water storage under pressure, another of the jet pump which pushes water down into a well in order to help lift the water up from the well, and still another with pictures of the hot water unit, etc.

Mrs. Young had dreamed about all these things. The water outfit and the well would cost \$2,000. Mrs. Young had said, "I know that I am 67, but if I can have just one year on this farm with all the water I want and not be obliged to measure it by the cupful (and stint at that) then I'll rest in peace the rest of my days."

One of the drillers said (he wasn't cheerful about it either), "It does not look as if we would find water even at 200 feet, but my boss told me confidentially that if we do not find water at 200 feet, where you say we must stop, then to drill a day and a half more, going to 225 feet—the last 25 feet on the house because of the pluck you folks have shown!"

"Pluck, sand, courage or anything else," answered Mrs. Young, "I haven't any of these things left. An old farm couple ready to die, and putting \$1,200 into a hole in the ground!"

As the group ate, the drilling machine which had been put into operation just as the dinner call was sounded kept pounding away. During the mid-day meal the drill went down through another foot of ledge rock.

Suddenly there was a different sound to the drilling operation outside the kitchen window! The drill had dropped through the ledge rock, evidently into a split in the eternal rock foundation. An old and experienced driller sensed what that might mean. He leaped from the table and his overturned chair went smashing on the floor. There was no excusing himself and he left the kitchen door wide open when he raced through. The Youngs followed.

One hundred seventy-one feet! A rift or crevice in the ledge. Water! They couldn't pump it dry. Up 101 feet from the bottom of the drilled well the underground water (which doubtless comes from the mountains many miles away) flows at 30 gallons a minute!

With an electric jet pump installed, they are unable to lower the water an inch even at the 30-gallon flow. More water than turkeys can drink, water for a bathroom, a tank of hot water—water for everything!

Water for everything except the lawn! The driller explained that because this underground water comes from such a distance down in the earth, it will be ice cold even in the hottest summer weather, and to sprinkle it directly on a lawn parching under a hot August sun would wilt the grass with much the same effect as an early frost.

Mr. Young confesses now that he was of a mind to order the work to cease at 170 feet. Says he needed a new tractor like all outdoors, and it didn't make him happy to see its purchase price poured down a hole in the ledge. Mrs. Young merely smiles in an indulgent sort of way and says now she guesses she'll "wash her hands of everything!"

The century-old farm now surely has the water to do it!

— A.A. —

BILL GATES AND THE "BELLE QUEEN"

(Continued from Opposite Page)

as well as from exhaustion. How many times he slept and roused himself he does not know; but at last he dreamed, as it seemed to him, that the rest of the crew of the Belle Queen

were once more on board, that they had just tacked the schooner and were heading away for Buffalo, and that a big steamer was bearing down on them as the one had done the night before, except that now her lights were flashing up in brilliant red flames at intervals, only to die out and disappear at times.

There she was, on the weather bow, drawing nearer with every swell, while he stood unable to turn the wheel or do anything to avoid the impending collision. The Captain and the mates yelled at him to put down the wheel, but though he strained every muscle not a turn could he make. Then, with a blow that knocked him across the deck, the steamer struck the schooner, and Bill awoke.

He was certainly lying on the deck, but not as the result of a collision. He

had fallen from sheer exhaustion. With his teeth chattering with terror—for he realized the peril in which he was placed by fatigue, and his inability to longer resist its influence—he scrambled to his feet. The vessel had broached to when he fell, and with a hasty motion he put up the wheel. She fell off at once, and the next moment Bill had forgotten alike his danger and his fatigue.

One more feature of the dream was real. Not only had he been knocked down, but there was the flashing red light fair on the starboard bow. Quickly turning his head further to the right, a fixed white light was plainly seen through the night, while the lights of a tug headed for the schooner were visible below the big white light.

Before him was Buffalo harbor and safety and rest.

He had saved the Belle Queen. And now the lad who had been called the most stupid boy in Sheridan was received when he went ashore as a hero. In great danger he had shown remarkable presence of mind, and under the most trying circumstances had exhibited unusual seamanship, bravery and skill. His conduct was commented upon and lauded in the newspapers, and everybody, both strangers and his own townsmen alike, echoed his praises.

Bill had found his vocation in life. He was a born seaman, and stupid though he had seemed in his youth, his early and his riper manhood showed that the dormant intellect of the boy only needed favoring conditions in order to develop qualities that would command both admiration and respect.

The End.

"IT'S NEW, TOO!"

"This farm's changed. Tractors roll where horses used to poke along. Machines are handling the heavy work. This telephone's new to me, too. It's a fine farm tool."

The number of rural Bell telephones has more than doubled in ten years and more are going in all the time.

Service has improved, too. It's clearer, faster, and more dependable.

Nine out of ten Bell telephones in rural areas are the newer lift-the-receiver type. The number of parties on party lines is being reduced, and nine out of ten have improved ringing, so that each party hears fewer rings. These advances are being extended as fast as possible.

Each day is a big and busy day of further growth and new development for the rural telephone.

BELL TELEPHONE SYSTEM

Prizes Galore for

From RUSSELL-MILLER MILLING CO., Minneapolis, Minn.
To each of the ten high State winners: One 50-lb. sack of Occident Family Flour.
To each of the 53 Pomona winners: One 10 lb. sack of Occident Family Flour.

From R. B. DAVIS CO., Hoboken, New Jersey
To each of the ten high State winners: One 24-ounce can Davis Baking Powder; 1 lb. can Cocomalt; 1 Davis Cook Book; 1 set Davis Quick Mix Baking Charts.
To each of the 53 Pomona winners: One 12-Ounce can Davis Baking Powder; 1 Davis Cook Book; 1 set of Davis Quick Mix Baking Charts.

From AMERICAN SUGAR REFINING CO., New York, N. Y.
To each of the ten high State winners: A Domino Picnic Basket containing 11 different packages of Domino Pure Cane Sugar.
To each of the 53 Pomona winners: Two jars of the New Domino Sugar and Cinnamon.

A GOOD LOAF of homemade bread has always been worth a lot, but, come next October when New York State Grangers meet in Elmira, N. Y., for their annual session and the wind-up of the big statewide Grange-American Agriculturist Bread Baking Contest, a prize loaf of bread is going to be worth hundreds of dollars to its maker!

For the past fifteen years, the New York State Grange and *American Agriculturist* have been joining hands in conducting annual baking contests. Each year thousands of Grangers take part in the local and county contests, and the excitement runs high when it comes time to pick the State champion and runners-up. Valuable prizes are always at stake—but this year's prize list tops them all!

SIX GRAND PRIZES

Instead of one grand prize this year, there will be SIX GRAND PRIZES—one for each of the contestants who place among the first six in the final state contest. The following *American Agriculturist* advertisers are donating the grand prizes:

- De Laval Separator Co., New York, N. Y.
- International Harvester Co., Chicago, Illinois.
- Kalamazoo Stove and Furnace Co., Kalamazoo, Michigan.
- Knox Stove Works, Inc., Knoxville, Tennessee.
- Speed Queen Corporation, Ripon, Wisconsin.

The No. 1 State Bread Contest winner will have her choice of one of the six grand prizes. The No. 2 winner will have her choice of one of the remaining five grand prizes, and so on in rotation for the rest of the six high winners. In order to facilitate delivery of the grand prizes to the six high winners, each county winner will be sent a blank on which to list her preferences two weeks before the state contest.

CASH PRIZES

Over \$250 in cash will be awarded to State Contest winners by the New York State Grange and *American Agriculturist*. The Grange awards will be

From KNOX STOVE WORKS, Inc., Knoxville, Tennessee
To one of the six high State winners: A New Mealmaster Combination Oil-Electric or Coal-Electric Range.

From DE LAVAL SEPARATOR CO., New York, N. Y.
To one of the six high State winners: A 17 cu. ft. Model F-120 De Laval Speedway Food Freezer.

Mrs. Irene Lavery, Geneseo, N. Y., chairman of the State Grange Service and Hospitality Committee.

in the form of a \$3.00 entry prize to each of the 53 county winners entering the final State contest, making a total of \$159 in entry prizes.

American Agriculturist cash prizes to state winners add up to \$100 and will be divided as follows:

First	\$25.00
Second	20.00
Third	15.00
Fourth	10.00
Fifth	5.00
Sixth	3.00
Seventh	2.00
Eighth to 27th, \$1 each	20.00

STATE AND POMONA PRIZES

The TEN HIGH State winners and the 53 COUNTY WINNERS will each receive valuable merchandise prizes from the following *American Agriculturist* advertisers:

- American Sugar Refining Co., New York, N. Y.
- Cooperative G.L.F. Exchange, Inc., Mills Division, Buffalo, N. Y.
- R. B. Davis Co., Hoboken, New Jersey.
- General Foods Sales Co., Certo Division, New York, N. Y.
- Russell-Miller Milling Co., Minneapolis, Minn.

The Pomona prizes have already been shipped to

Grange Bread Contest!

the chairmen of the Pomona Grange Service and Hospitality Committees for distribution to the 53 county winners.

Heading up the contest for the State Grange is Mrs. Irene Lavery of Geneseo, N. Y., chairman of the State Grange Service and Hospitality Committee. When we told her about the prizes that *American Agriculturist* advertisers are giving to Grange Bread testers this year, she wrote us:

MRS. GRACE WATKINS HOCKETT
American Agriculturist
Home Editor

"You certainly have worked for and obtained wonderful prizes for our contest. We are getting fine reports of bread contests from the different counties. I think you are doing a grand job. Many thanks."

Other Grangers who are helping in the mammoth job of running this state-wide contest are Mrs. Herbert Thomsen of Poughkeepsie and Mrs. Ola Scudder of Fleischmanns (both members of the State Committee); the 53 chairmen of Pomona Service and Hospitality committees, and the chairmen of nearly 1,000 Subordinate Granges.

On the *American Agriculturist* side of the picture, contest details are handled by Assistant Editor Mabel Hebel and Home Editor Grace Hockett. Ten thousand score cards, containing standards for scoring yeast bread and the contest rules, were printed and distributed by *American Agriculturist* last February, when the

MRS. MABEL HEBEL
Assistant Editor
American Agriculturist

bread contest got off to a fast start. Most of the Subordinate Grange contests have already taken place, and county contests are now under way. The names of all county winners will be published in *American Agriculturist* as soon as Pomona chairmen's reports are received.

As we go to press, word comes from Mrs. William Schulenberg, Dutchess County chairman, that their county winner is Mrs. Florence McEnroe of Amenia. Twenty subordinate grange winners competed in the Dutchess County contest. Mrs. McEnroe is the first county winner to be reported to contest headquarters.

Every one of the 140,000 Grangers in New York State is eligible to take part in the contest, with the exception of those who are professional bakers. Many Grange brothers have tried their skill and luck in past contests, and have even won a county contest or two—but the weaker sex always comes out on top in the final state contest!

From COOPERATIVE G.L.F. EXCHANGE, Inc.,
Mills Division, Buffalo, N. Y.
To each of the ten high State winners: 1-5 lb. sack G.L.F. Pancake Mix; 1-2 lb. sack of G.L.F. Cake Flour; 1-5 lb. sack of G.L.F. Quality Patent Flour; 1-5 lb. sack of G.L.F. Quality Pastry Flour.
To each of the 53 Pomona winners: 1-5 lb. sack of G.L.F. Quality Patent Flour; 1-5 lb. sack of G.L.F. Quality Pastry Flour.

From INTERNATIONAL HARVESTER CO.,
Chicago, Illinois
To one of the six high State winners: Model U-95 International Harvester "femineered" Refrigerator.

From GENERAL FOODS SALES CO.,
Certo Division, New York, N. Y.
To each of the ten high State winners: \$2.00 in cash.

From SPEED QUEEN CORPORATION,
Ripon, Wisconsin
To one of six high State winners: a Deluxe Console Speed Queen Ironer.

From SPEED QUEEN CORPORATION,
Ripon, Wisconsin
To one of the six high State winners: A Heavy Duty Speed Queen Washer.

From KALAMAZOO STOVE AND FURNACE CO.,
Kalamazoo, Michigan
To one of the six high State winners: A new 1950 Kalamazoo Gas Range Model DL-144.

We Clean the Pool

YESTERDAY my schoolboy helpers and I grabbed the opportunity presented by the first warm day and cleaned out the pool. The job had been done only partially from time to time and roots of water plants had run rampant in the muck at the bottom.

After removing the goldfish we dipped and toted the little water left there after this winter of light precipitation in our area. Then we had to use spade and shovel to break up roots of cat-tails and yellow flag. We lifted out the crocks which originally had held the red and pink waterlilies. These are being replaced by 1-inch pine board boxes, about 18x18x10 inches in size; these are filled with good rich soil, the divided plants put into them, and 1 inch of sand put over the top of the soil to prevent muddying the water. The rhizomes are set with the growing point level with the top of the soil.

We left some mud at the bottom of the pool in deference to the one frog that had wintered over there but still was not ready to come out for the summer. This mud is what the lilies like, and if they overrun their boxes they will go back to their former rampant condition even though they are small growing varieties. I took myself in hand and finally got rid of the sweet white lily that had taken over the pool to the detriment of the smaller and weaker—and choicer—varieties. Since this is a small pool, it is better to restrain growth somewhat. However, the pool does meet the condition that roots are below the average ice depth in winter, yet not over 3 feet deep.

Needless to say, we all came away from that job well besmirched. There's nothing like swamp ooze for that!

Now I'm afraid of what I see out in the chrysanthemum border. Our mild winter, topped off by a wintry March, wasn't to their liking. Here's hoping that more warm days will bring up enough shoots to give me a few varieties at least.

— A.A. —

TRY RHUBARB IN JAM

STRAWBERRY AND RHUBARB JAM

1 quart rhubarb 1 quart strawberries
1 1/2 quarts sugar

Cut unpeeled rhubarb in 1/2-inch pieces. Mix strawberries, rhubarb and sugar and cook mixture slowly until it is thick and clear. Cook rapidly to preserve the bright natural color and natural flavor. When the mixture begins to thicken, stir and watch carefully to avoid burning. When the sirup "sheets off" the spoon, lift kettle from heat and let stand a few minutes so mixture may stiffen slightly, thus helping to prevent floating fruit. Pour into clean hot jars and seal. Yields 6 to 8 6-ounce jars.

GOOSEBERRY AND RHUBARB JAM

1 navel orange (1/2 cup juice, 1/2 cup peel) 2 cups unpeeled rhubarb, cut in 1/2 inch pieces
1 cup water 3 cups gooseberries, chopped

Squeeze juice from orange. Remove white membrane from inside of peel, then cut peel in thin strips about one inch long. Add water to peel; cook slowly in small covered pan until tender, about 30 minutes. Combine cooked peel, liquid, rhubarb, gooseberries and sugar. Boil mixture rapidly, stirring frequently until it is thick, about 15 minutes. Add orange juice; continue cooking until mixture is again thick, about 3 minutes. Pour the jam into clean hot glasses and seal. Yields 4 to 5 6-ounce glasses.

A rhubarb product, whose possibili-

ties are too often overlooked, is juice. This may be made even from rhubarb which is too coarse to use for sauce. For large quantities of fruit punch, I have used rhubarb juice for part of the acid—quite an idea especially when lemons are high. However, much tasting is necessary in order to keep the rhubarb in its place!—G.W.H.

GREEN ONION SOUP

In the early days of spring there is nothing better for supper than a bowl of steaming hot green onion soup. It is the first of the garden and really hits the spot.

Chop 3 cups of tender green young onions, using part of the tops. Cover them with 6 cups of water, add 3 slices bacon diced, 1/2 teaspoon salt and 1/4 teaspoon black pepper. Simmer gently until onions are tender. Then thicken with 1 tablespoon flour, rubbed or blended to a smooth consistency with 1 tablespoon butter. Serve hot.—B. C.

— A.A. —

CUT NYLON CROSSWISE

When you're getting ready to sew on nylon, place the pattern pieces on the material so seams fall crosswise of the material. This practice will do a good deal to give successful results because seams that run lengthwise (warp-wise) on nylon show the greatest tendency to pucker. Other recommended ways of cutting nylon are to do it so seams fall on the bias, on a curve, or at any

APPLE TREES

By Elaine V. Emans

We who are glad of apple trees
Are legion, Lord: robins and bees,
And every lad when he discovers
He can climb them; apple-lovers
From orchard men to those who cook;
And all who swear there is a look
And feel of peace that clings about
A place where apple trees take root.

NEW KITCHEN CABINET

A very useful kitchen cabinet, for use as a mixing center, has been designed by Mrs. Mary K. Heiner of the New York State College of Home Economics. The upper shelves are shallow, the depth of one container, thus eliminating the usual reaching behind to get supplies. The lower section is equally well planned to make the whole job of mixing as easy as possible.

If you are interested in making this mixing cabinet, working drawings (with measurements, etc.) are available at 75 cents. Send your request for the drawings to Miss Ruby Loper, Van Rensselaer Hall, N. Y. State College of Home Economics, Ithaca, N. Y., and enclose check or money order made out to Treasurer of Cornell University.

New Cotton Crop

No. 2060. Simple uncluttered lines are coolest for summer — see this shoulder-buttoned dress accented only by scallops and big pockets! Sizes 12-20; 36-42. Size 18, 4 1/2 yards 35-inch fabric.

No. 2117. The casual look—for cotton! Rever neckline is new, neat-looking . . . panel yoke is slenderizing . . . hip pockets are hidden. Sizes 12-20; 36-44. Size 18, 4 yards 35-inch, 2 3/4 yards trim.

No. 2527. All ages love sun ensembles! This one—bare-top princess dress with bolero—is for little girls in the

6 to 14 size group. Size 8, 2 3/4 yards 35-inch fabric for dress and bolero. **No. 3525.** Sun-dress or street costume—depends on whether or not you are wearing the collared bolero. Note the cuffed basque bodice. Sizes 12-20. Size 16, dress and bolero, 6 yards 35-in.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 20 cents for each pattern wanted. Add 20 cents for our new Summer Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

Crunchy Corn Sticks are so easy to make and do such a lot for a meal!

Don't Wait for the Milk to Turn!

By Helen E. Ridley

EVERY GOOD COOK knows the moist crumb, rich flavor and fine keeping qualities that products made with baking soda have, but not every cook knows how to bake with soda when she doesn't have sour milk or buttermilk.

Recent experiments have proved that correct proportions of sweet milk and vinegar in combination with baking soda will give the same luscious texture always achieved with sour milk and soda mixtures, and there's no guesswork about it with the new recipes given below. The amount of milk and vinegar has been worked out for you, to make sure you'll get perfect results every time. So don't wait for the milk to turn. It's easier for you to turn to baking the new way.

Here's a basic recipe for waffles. It turns out the most luscious, tender light waffles you ever put in your mouth—so good, so easy to make. Try the waffles plain, then vary them as suggested below. You can serve several variations at one meal. Try serving a variety of waffles for lunch or supper as well as for breakfast.

GOLDEN CRISP WAFFLES

8 cups all-purpose flour 4 eggs, separated
2 teaspoons baking-soda 1/2 cup vinegar
2 tablespoons sugar 3 1/2 cups sweet milk
1 teaspoon salt 2/3 cup melted shortening

Sift some flour onto a piece of waxed paper. Measure 4 cups and sift with baking soda, sugar and salt into a large mixing bowl. Beat egg whites until stiff, then yolks until creamy. Add vinegar and milk to egg yolks; beat well. Add egg mixture and melted shortening to dry ingredients. Stir until batter is smooth. Fold in egg whites. Do not beat. Pour batter on heated iron to about one inch of edge. Bake 3 to 4 minutes or until waffles stop steaming. Serve with butter and sirup. Makes 12 to 14 waffles.

Ways to vary plain waffles:

BACON WAFFLES: Pour batter on iron in usual manner, then place 2 or 3 inch lengths of thinly sliced bacon over batter. Close iron. Bake.

PECAN WAFFLES: Sprinkle a small handful of pecans on iron, then fill with batter in usual manner. Close iron. Bake.

HAM WAFFLES: Pour batter on iron in usual manner, then evenly sprinkle 2 or 3 tablespoons of ground or chopped boiled or baked ham over batter. Close iron. Bake.

CORN WAFFLES: Pour batter on iron in usual manner, then sprinkle 2 or 3 tablespoons well-drained kernel corn over the batter. Close iron. Bake.

COCONUT WAFFLES: Pour batter on iron in usual manner, then sprinkle 1 or 2 tablespoons shredded coconut over batter. Close iron. Bake.

Corn sticks just aren't up to par unless they're made with soda, and now with a brand new recipe using vinegar and sweet milk instead of sour milk, soda corn sticks can come to the table more often. Here's the recipe:

CRUNCHY CORN STICKS

1 cup sifted flour 1 egg
1 cup yellow corn meal 2 tablespoons lemon juice
3/4 teaspoon baking soda and sweet milk to make
1/2 teaspoon salt 1 cup
2 tablespoons sugar 4 tablespoons melted butter

Sift together into large mixing bowl flour, corn meal, baking soda, salt and sugar. Beat together egg, lemon juice, milk and melted butter. Stir into flour mixture and mix until smooth. Fill corn-stick pan 2/3 full. If iron pans are

used, preheat before filling. Bake in a hot (400 degrees F.) oven 20 to 25 minutes. Makes 10 to 12 corn sticks.

Because pie is an all-time favorite, here's a recipe for a new spiced pastry that scrumptiously teams up with all kinds of pie fillings. Try it with pumpkin pie. It's perfect for an apple or applesauce pie. And don't overlook its merits with mince meat or vanilla custard pie.

SPICED PASTRY

2 cups sifted all-purpose flour 1/4 teaspoon ginger
1/4 teaspoon cloves
1/4 cup brown sugar 1/2 cup shortening
1 teaspoon salt 1 tablespoon vinegar
1/2 teaspoon cinnamon 3 tablespoons orange juice or other citrus fruit juice

Sift dry ingredients together. Cut in shortening. Mix together vinegar and fruit juice and add to dry ingredients. Mix lightly with a fork. Roll dough 1/8 inch thick and use for pies or tart shells. Bake at 425 degrees F. about 10 to 12 minutes.

Makes enough for one 2-crust 8-inch pie; two 9-inch pie shells or 12 4-inch tart shells.

(Note: If you have sour milk or buttermilk and wish to use it instead of the vinegar and sweet milk, follow the recipes as given EXCEPT in WAFFLE RECIPES substitute 4 cups sour milk or buttermilk for amount of vinegar and sweet milk given. In CORN STICK recipe substitute 1 cup sour milk or buttermilk instead of the lemon juice and sweet milk in the recipe.)

A Happiness Factory

By Mae Colgrove Smith

ONE day in late autumn, we visited friends of former years and discovered a happiness factory! Their farm home lies "a look and a crook and a right smart distance" from large towns, as they say in the South. The place reminded us of a beehive or an anthill. A truck loaded with potatoes entered the road to the barn. Another dashed out after the driver had secured fox bait for a field trap. The parents were storing apples in the cellar. Two daughters were cleaning house.

The whole family is interested in taking snapshots and has a large collection of pictures of wildlife—a deer lying in a forest (a pose almost impossible to obtain), a stately ring-neck pheasant in open country, a rattlesnake crossing a road, and others of raccoons, foxes, etc. And, of course, there were pictures of farm animals, too. We liked one of fat horses grazing near the still

SUGGESTION

By Eleanor Alletta Chaffee

Let's not be a perfect couple
With never a wrong side showing.
Let's hang love's cloak on the clothesline
Where fresh summer winds are blowing!

Let it be patched and mended,
Faded and patched again,
Let it be mellowed by weather,
Soaked with a driving rain,

So it will last a lifetime,
So it will prove its worth;
Not laid away in a cedar chest,
But tested by tears and mirth.

water of a pond, their image almost perfectly duplicated in the water.

The father of the family is interested in many things. He showed us a vase holding a plant in blossom—a bulb that grew without soil or water. A large cactus in the room had developed a purple plum-like fruit, the result of placing a honey bee among the flowers while the plant was in bloom.

We saw the bountiful evidence of autumn: a heap of golden hybrid corn, hundreds of bushels—a boy cashing in on his agricultural course; honey in the comb; poultry; a garden—flowers everywhere; tamarack and locust on a bluff; a half-hundred butternut trees.

Life on the farm is full, rich, and independent. While this family enjoys modern amusements, they have entertainment and happiness that cannot be "bought." They can furnish their own recreation. For instance, they told us that sometimes at twilight they drive down the highway a bit and listen to the songs of the bells recently installed in their flourishing rural church.

Someone has said, "Own your own business, know your own business, mind your own business." On such principles America was founded. By such principles, this family is living. We went home from our visit with more faith in our country's future.

You've Only One Pair!

By RUBY PRICE WEEKS

YOUR FEET are simply killing you? Are you treating them with the proper respect? Better had. You'll be out of luck should they very suddenly refuse to function. And they might with the countless activities ranging from your regular housework through those hours of various outside tasks, plus perhaps an occasional night of dancing.

Of course, there may be something structurally wrong with your feet; but if there's nothing definitely wrong with them, discomfort probably comes from improperly fitted or cheap shoes. They are the first step to real foot trouble. Buy shoes which are right for your particular feet. No longer does smart footwear feature high heels exclusively. Heels may be low, medium or high, depending upon the wearer's preference and her type of foot.

But for feet to be comfortable, they must be given very special care, regardless of the type of shoe worn. Particularly is this true if one stands or walks for hours at a time. If in that class, take your weight off your feet whenever there is an opportunity and

then lie down with feet higher than your head for a while. That does wonders for a person. The relaxation not only rests one's poor feet but prevents their swelling. And one can't be glamorous with puffy ankles and feet!

Make it a ritual to bathe your feet every night if you are having any trouble with them. Use warm water; hot tends to cause swelling unless followed immediately by cold. Dry thoroughly and pamper spaces between toes where the skin is tender. Scrub bottoms, backs of heels, and any other places which are at all likely to callous, with a stiff brush. Dry well and rub in cream.

Wash your feet in the same manner each morning if you can possibly take the time. After washing, dry thoroughly and dust with body powder. As a final gesture, sprinkle foot powder in the shoes and slide your feet into them. You'll then be ready for the most strenuous day's work or play. The resulting comfort will more than repay you for the time given to their care.

Care for those feet. Remember, you've only one pair!

TIME-SAVER: When Sally's or Junior's dungarees begin to wear at the knee, you can mend them in a jiffy with patches like those shown above. They're made of cotton drill, are sanforized, have non-raveling edges, and come in six colors—brown, navy, black, maroon, green, and taupe. You just iron 'em on!

Mrs. Smafield shows her family a photograph of her \$50,000 check.

WINS \$50,000 IN NATIONAL CONTEST

The country's Number 1 prize cook—that's Mrs. Ralph E. Smafield of Detroit, Michigan, winner of the biggest contest of its kind ever held in the United States. Competing against America's top-ranking cooks in the Grand Ballroom of a New York hotel, Mrs. Smafield was awarded the grand prize of \$50,000! Mrs. Smafield—who is a busy wife and mother—says, "One of the first things I learned was how important good ingredients

are. Take yeast, for instance. I've used Fleischmann's Yeast for 6 years because I know what a fine, lively yeast it is. It's always fast rising and I can depend on it for perfect success."

No doubt about it! Fleischmann's Yeast is made extra active to rise extra fast—made to give you finest results when you bake at home. No wonder America's prize-winning cooks prefer Fleischmann's Yeast to all others.

5 doctors prove this plan breaks the laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

DEPT. A, MANSFIELD, MASSACHUSETTS

Sally Saves

Cooking Hints

FROM Sally Saves' readers come these cooking hints:

"Before peeling hard winter squash, scrub it thoroughly, then put it in a low temperature oven to wilt the rind. After it has cooled, you will find the squash easy to peel and cut up."—Mrs. Erwin D. Cooper, R. D. 1, Gillett, Pa.

"Cut left-over cake into 1½ inch pieces and place, about an inch apart, in a deep casserole. Cover with a custard similar to that used for custard pie. Bake in moderate oven until firm.

"You can make marble cake by cutting left-over spice or chocolate cake in small pieces and placing about an inch apart in square pan. Cover with your favorite white cake recipe, making sure that the batter fills all the hollow places. Bake in a moderate oven."—Mrs. George H. Dobert, Sand Lake, Tarborton, N. Y.

"Those of you who have your own potatoes stored in cellar bins know how they start to sprout or sometimes wrinkle in the spring. Instead of throwing them out later, I can the small ones before spring work starts.

As I peel the potatoes, I put them in cold water to prevent discoloration. Pack tightly in jars, adding a teaspoon of salt to each quart. Cover with cold water and cold pack, boiling a half hour. Small canned potatoes are delicious in stew and salad and even mash nicely."—Mrs. Laura A. Hunt, Box 5, Hillsdale, N. Y.

"I find that adding some cocoa to oatmeal makes it more palatable for my boys, and they eat it right up. A little extra sugar may be desirable when serving."—Mrs. Kenneth Oliver, North Anson, Me.

"Left-over pancakes dried thoroughly and then ground can be used in any breadcrumb recipe."—Mrs. Charles Barton, R. D. 1, Claremont, N. H.

"When canning peaches, I make sir-up from the peelings. Cover the peelings with water and boil until quite soft. Drain in a colander, then through a sieve or strainer, but don't mash. Boil the juice with cup for cup of sugar added, until quite thick and light red in color. It will keep in jars under paraffin and is good on pancakes."—Mrs. George Raps, Box 3, Clarence Center, N. Y.

"Ready-Made"

HALF or more of the work is done when you order needlework items like those pictured here. The material is furnished—and they're ready-made. You just put on those finishing touches that lift an article into the hand-made class.

BOOTIE & MITTEN SET—Kit No. 8545 comes in soft pink or blue bunny cloth, stamped with dainty designs for simple touches of pastel embroidery. Embroidery floss and matching ribbons are included in the package. Price per set, 98 cents. State color desired when ordering.

PILLOW CASES—Kit No. 8746 contains pair of pillow cases stamped for attractive embroidery and hemstitched for crochet edges. Two complete hot iron transfer alphabets, white crochet thread, and pink or blue embroidery floss are included in the package. Price per pair, \$2.50. When ordering, state color of embroidery floss desired.

LINEN GUEST TOWELS—Kit No. 8703 has attractive designs stamped on de luxe flamingo or wine linen, hand-thread-drawn hemstitched hems. Floss for working included in package. Price \$2.00. State color desired when ordering.

"PLAYTIME" BIBS—Kit No. 8657 contains set of two ready-made bibs in pink, blue or maize, Lady Pepperell fabric, finished with flannel backs, binding and tie strings. Percale patches for applique and the necessary embroidery floss are included in the kit. Price for the set, 85 cents. State color desired when ordering.

TO ORDER any of these items, write to Embroidery Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, New York, and enclose money order or check (no stamps, please) for the amount of your order. Be sure to give your name and address and the numbers of the articles you want.

When you make Brownies, don't stop with the chocolate ones! Equally delicious are the seven different kinds for which recipes are given below.

Brownies for Every Taste

By ADA SAVAGE TUCKER

WHEN WE think of Brownies, we are likely to have in mind the chocolate or butterscotch varieties. Here are other kinds, some quite sweet and others not so sweet. All have their uses and their own special appeal.

PECAN BROWNIES

$\frac{3}{4}$ cup flour
 $\frac{1}{4}$ teaspoon salt
1 cup pecan meats
 $\frac{1}{3}$ cup butter

Measure the sifted flour; sift with salt added. Lightly mix in broken pecans, reserving a few whole ones for decoration if desired. Cream butter; blend in sugar, then molasses and well-beaten egg. Add dry ingredients and mix well. Pour mixture into a greased 8x8 inch pan. Arrange nuts if used for decoration in such a way as to cut to advantage. Bake in moderate (350 degrees F.) oven for 20 minutes. Cut in finger lengths or in 2-inch squares. Makes 16 squares.

LUNCH BOX BROWNIES

1 package (9-oz.) dry mincemeat
1 cup boiling water
 $\frac{1}{2}$ cup shortening
1 cup brown sugar, firmly packed
2 eggs
1 cup sifted flour
 $\frac{1}{2}$ cups quick cooking oatmeal
 $\frac{1}{2}$ teaspoon salt

Break mincemeat into saucepan, add boiling water and cook 3 minutes, stirring constantly. Cool. Cream shortening and sugar; blend in beaten eggs. Add dry ingredients; mix well. On a greased 9x9 inch baking pan spread $\frac{1}{2}$ the oatmeal mixture; over this spread the mincemeat filling, then the remainder of the oatmeal mixture on top; handle carefully to keep layers even. Bake in moderate oven (350 degrees F.) 30 to 40 minutes or until firm to the touch. When entirely cold cut into fingers 1x3 inches. Makes 24.

FROSTED BROWNIES

$\frac{1}{2}$ cup shortening
1 cup brown sugar
3 egg yolks
 $\frac{1}{2}$ cups flour (cake)
 $\frac{1}{2}$ teaspoon salt
1 teaspoon baking powder
1 teaspoon vanilla
1 egg white
 $\frac{1}{2}$ cup brown sugar
 $\frac{1}{2}$ cup chopped nuts

Cream shortening; blend in 1 cup brown sugar. Add beaten egg yolks and vanilla, then flour, salt and baking powder sifted together. Mix well, spread about $\frac{1}{4}$ -inch thick on 10"x14" cookie sheet. Spread stiffly beaten egg white over the mixture; over this sprinkle the $\frac{1}{2}$ cup brown sugar and chopped nuts. Bake at 350 degrees F. for 25 minutes; watch carefully. Cool slightly, cut into $1\frac{1}{2}$ x $3\frac{1}{2}$ inch fingers. Makes 28.

FRUITED BROWNIES

3 eggs
 $\frac{3}{4}$ cup brown sugar
 $\frac{1}{2}$ teaspoon vanilla
 $\frac{1}{4}$ cup flour
1 teaspoon baking powder
Few grains salt
1 cup broken walnut meats
1 cup dates, shredded

Beat eggs, sugar and vanilla well. Add dry ingredients sifted together.

Lastly add nuts and dates. Spread in well-greased 9x9 inch pan. Bake in 375 degrees F. oven 15 to 20 minutes or until firm to the touch. Let stand at least 5 minutes before cutting in $1\frac{1}{4}$ x3 inch finger lengths. Makes 21.

BRAN BROWNIES

$\frac{1}{2}$ cup shortening
1 cup sugar
2 eggs
2 squares unsweetened chocolate
 $\frac{1}{2}$ cup bran
 $\frac{1}{3}$ cup flour
 $\frac{1}{2}$ teaspoon salt
1 cup broken walnut meats
1 teaspoon vanilla

Cream shortening; blend in sugar and beaten eggs. Add melted chocolate (melted over hot water) and beat well. Add bran, flour, nuts and salt well mixed together. Add vanilla. Spread in greased 8x8 inch pan and bake in moderate 350 degrees F. oven 30 to 35 minutes, or until firm to touch. Cool, then cut into $1\frac{1}{2}$ x $2\frac{3}{8}$ inch fingers. Makes 24.

GOLDEN FRUIT BROWNIES

$\frac{1}{2}$ cup shortening
 $\frac{1}{2}$ cup molasses
2 eggs
 $\frac{3}{4}$ cup flour
 $\frac{1}{2}$ teaspoon baking soda
 $\frac{1}{2}$ teaspoon nutmeg
 $\frac{1}{2}$ teaspoon cinnamon
 $\frac{1}{4}$ teaspoon cloves
 $\frac{1}{2}$ teaspoon salt
1 cup chopped nuts
1 cup chopped seedless raisins

Melt shortening; cool. Add molasses and eggs; beat. Add sifted dry ingredients; mix well. Add nuts and raisins and spread mixture in greased 10x6x1 inch pan. Bake in moderate 350 degrees F. oven 30 to 35 minutes. Let cool for 5 minutes; cut into $1\frac{1}{4}$ x2 inch fingers. Makes 24. These are not too sweet and are especially good with a cup of tea.

PEANUT BUTTER BROWNIES

2 squares unsweetened chocolate
 $\frac{1}{3}$ cup shortening
 $\frac{1}{4}$ teaspoon salt
1 cup sugar
2 eggs, well-beaten
 $\frac{1}{2}$ cup flour
 $\frac{1}{3}$ cup peanut butter

Melt over hot water the chocolate and shortening; add sugar and stir until smooth; blend in well-beaten eggs. Add flour and salt sifted together. Stir in the peanut butter, leaving tiny lumps. Spread in greased 9x9 inch pan and bake in moderate 350 degrees F. oven for 25 minutes. Cut in $1\frac{4}{5}$ inch squares while still warm. Makes 25.

When making chocolate brownies, try adding $\frac{1}{8}$ teaspoon oil of peppermint instead of vanilla—nice to serve with ice cream. Also, the large cooking peanuts go well in butterscotch brownies instead of walnuts or pecans.

Just before serving brownies, dust them with powdered sugar, especially the less sweet ones, such as the pecan and golden fruit varieties.

When a jar of fruit is opened and some is left over, plan to use it in a different way—in gelatin desserts, fruit salads, and in sauces for custards and cakes.

You can make better Strawberry Jam faster with CERTO!

And you get more too!

Oh what a wonderful difference when you make jams and jellies with Certo! More flavor and fragrance—they don't boil away! And it's so much easier, quicker—a one-minute boil does the trick! You average 50% more glasses from the same amount of fruit, too. Over 80 tested recipes with every bottle.

Here's **STRAWBERRY JAM** plus!
(plus rhubarb)

4 cups prepared fruit
 $\frac{1}{2}$ bottle Certo
7 cups sugar

Crush 1 quart fully ripe strawberries, and slice thin or chop about 1 pound rhubarb. Combine and measure 4 cups into large saucepan. Add sugar and mix well. Place over high heat and bring to full rolling boil... boil hard 1 minute, stirring constantly. Remove from heat and at once stir in Certo. Stir and skim by turns for 5 minutes. Ladle quickly into glasses—paraffin at once. You'll get about ten 6-ounce glasses.

For STRAWBERRY JAM—follow recipe above, using 2 quarts fully ripe strawberries crushed completely—no rhubarb.

There's magic in the word

HOMEMADE

A Product of General Foods

Kernels, Screenings and Chaff

By H. E. BABCOCK

I AM WRITING this right after having spent several hours with Boots Poelvoorde and Jack Conner going over their farms.

Late Spring

By all the records I have kept since we moved into the Inlet Valley over 30 years ago, this is a late, cold and somewhat dry spring. It has not been a bad spring to get work done, however, and the boys have theirs pretty well along. Wheat seems to be doing the best of any of their crops, but oats just haven't begun to grow yet although the boys got them in early and they were nicely up soon after the first of May.

Asparagus

We usually cut asparagus at Sunnygables shortly after the twentieth of April. This spring we had our first mess, and it wasn't too plentiful, on May 6. Most springs we have plenty of asparagus for freezing soon after the first cutting. It will take a warm soaking rain to bring on anything like the usual supply this year.

Pastures

I have two measures for adequate pasturage: (1) The growth must be lush enough so that a cow can eat all she can hold in less than an hour; (2) The protein content must be high enough so that cows will refuse grain.

The one bright spot this spring is that by May 1 on both farms the boys had rye, and brome and alfalfa, and brome and ladino pastures which met both standards.

On the field at Sunnygables which we sowed to winter barley and rye last fall as a preliminary step to seeding orchard grass, brome grass and ladino for an improved, irrigated pasture, the rye was so high on May 6 that we had to clip it. The winter barley, however, continues to lag behind the rye and, as I have said before, I can't see anything to recommend winter barley over rye for late fall and early spring pasture.

On the old stand of brome and alfalfa which we are test-grazing this spring, the brome grass and alfalfa are knee high and an interesting thing is taking place. The cows are eating the brome grass and are not biting off the alfalfa. In effect, what they seem to be doing is weeding the alfalfa.

The way they are operating leads us to wonder if they will actually delay the time when this field must be harvested. Jack has been hoping to set it back so that all his alfalfa and brome grass would not be ready at the same time.

Manure Troubles

In going over a 20-acre improved pasture which Boots has on his place, we were particularly interested to see what effect top dressing parts of it with manure has on the stands of ladino and brome. The manure used was the scrapings from the pavement in Boots' pen stable. It had little or

no straw in it. We were disappointed to observe that in the areas which have been top dressed during the past two winters the ladino is practically gone, and the brome is very rank. The cows are not eating this rank, very dark green brome.

On the other hand, areas which had been top dressed with 400 pounds of 0-19-19 are full of ladino. It is beginning to look as though we can't top dress our improved pastures with manure if we want to hold the stands of ladino.

On both farms there are several dozen loads of quite strawy manure accumulated in the pens. Just how to use this to best advantage is a problem. Some of it will be used to top dress oats on which seedings have been made, but none of us is sure enough of this practice to want to go all out on it. It may be that the boys will have to defer cleaning their pens until they have some land on which the manure can be spread and plowed under.

Nurse Cow Calves

To get his present dairy herd started, Boots raised a lot of calves on nurse cows. This method of raising produced some very big, husky heifers which got very fat on improved pasture. He sold some of these heifers and not all of them did well. It was therefore with some anxiety that we watched for the production of the heifers he kept. His own and DHIA records show that one, in 314 days, made 10,868 pounds of milk, 430 pounds of fat. Another, in 295 days, made 12,430 pounds of milk and 460 pounds of fat. A third, which is not yet dry, in 310 days has produced 11,360 pounds of milk and 420 pounds of fat. Other heifers promise to do about as well. While these are not phenomenal first calf heifer records, they at least indicate to us that good animals can be started on nurse cows.

Spring Calves

It is amazing to me how fast the boys on the two farms have built up their two herds. Boots has 40 females, all of which will be fresh by fall. His cows are mostly purebred and grade Holsteins, but he has three Brown Swiss-Holstein crosses which are worth a special report in themselves. I'll write about them at some later date. Jack, at Sunnygables, has between 30 and 40 head, over 20 of which will be milking this fall. His are mostly purebred Brown Swiss, but he has a couple of Swiss-Guernsey crosses which look pretty good. I'll report on them when I write about the Swiss-Holstein crosses in Boots' herd. Meanwhile, I'll make the generalization that the five crossbred heifers would have to be included in the top 25 per cent of the two herds.

Irrigated Garden

For years we have followed the good American custom of putting in a garden in the spring with great enthusiasm and high hopes, and then gradually letting the weeds and the

The modern tractor is more than a puller. Properly rigged, it is a pusher and a lifter as well. The pictures above and below show how Jack puts feed up to the second story of his hen house. Note the two-inch concrete floor (see arrows) which show at the right of interior picture. This floor was laid nearly 20 years ago on reinforced paper stretched over wood rafters and has been very satisfactory. —Photos by C. Hadley Smith

dry weather take over.

This year at Sunnygables we are continuing the tradition, but with a difference. We have laid our garden out along one edge of the irrigated pasture. We intend to sprinkle it as often as we think it needs water. Perhaps this will keep the ground soft enough so we can also control the weeds. On the other hand, I rather suspect that we probably will run into some problems, particularly in the way of diseases that will set us back on our heels. Well, if we do, it will be easy to plow the garden up and sow it to rye for fall pasture.

Applying Lime

This spring the boys have spread a lot of lime. Most of it has been put on with an attachment which goes on their manure spreaders. They find it most satisfactory. I believe that they figured they could make very good daily wages spreading their own lime

and, with the light manure spreader, they could get on land which would not carry heavy truck loads. The idea of a lime sower going on a manure spreader makes good sense. Also, the time is rapidly coming when, on farms like our boys are running, paid-out cash has got to be kept to a minimum.

Red Heads

To the Brown Swiss and the Rhode Island Red population of Sunnygables I can report an addition who matches the general color scheme. He is a red-headed boy, born May 6, 1950, to Jack and Jean Conner. I haven't heard for sure, but I have no doubt that he already has joined the 4-H, and has a Swiss calf getting ready to show at the fairs. As a matter of fact, a Swiss cow named Jean dropped a nice heifer calf just a few hours before the young fellow joined the Sunnygables staff.

MISREPRESENTATION STOPPED

PARTICULARLY during war years, we had a flood of complaints from subscribers who ordered cooking utensils from agents representing Steelco Stainless Steel, Inc., and did not receive the merchandise. At the time, we objected strenuously to the company's practice of continuing to take orders when no delivery date could be guaranteed, especially when the customer was not advised that it might be months before the goods were delivered. Eventually all claims were settled.

Now, however, the Federal Trade Commission has made public its findings in connection with the activities of Steelco Stainless Steel, Inc., and has issued an order to "cease and desist" from certain practices. Space will not permit publishing the entire order, but in general here are some of the practices that are mentioned and which agents are forbidden to follow:

Claims by representatives of Steelco that ordinary cooking methods result in destruction of vitamins, minerals or other food elements.

Claims that cooking in Steelco utensils will preserve minerals and vitamins, and will be conducive to good health.

Claims that these utensils have been endorsed or recommended by outstanding authorities in medicine or dietetics.

Claims that stainless steel is a new metal.

Claims that the utensils can be delivered immediately or within a certain specified time (if this is contrary to the facts).

Claims that eating food cooked or kept in aluminum utensils will cause cancer, stomach trouble, decayed teeth, or other illnesses.

This order was dated March 15, 1950, and the company was directed within sixty days to file a report with the Federal Trade Commission setting forth in detail the manner in which it has complied with the order.

No one at any time has claimed that stainless steel cooking utensils are harmful. The order of the Federal Trade Commission concerns only the alleged misrepresentations on the part of representatives of the company.

— A. A. —

WHOSE PROFIT?

I answered an ad which ran in a local paper and which offered details and working data on making money typing or doing longhand writing at home. I sent \$2 to the Williams Mail Service, Tampa, Florida, and received the material. They guaranteed satisfaction or money back. I wrote for more information and received a reply from a different concern, the Geis Mail Service of Tampa. I was still doubtful about the whole thing, so I returned the material to the Williams Mail Service. It came back marked "out of business." I then sent it to the Geis Mail Service with the same results. I'm now out \$2 plus a lot of postage. Is there anything you can do to help me get my money back?

We have never recommended homework plans of this kind. Experiences of readers have indicated that such outfits are mainly interested in the fee they charge. When subscribers actually get material, it is difficult to prove intent to defraud. A guarantee is no good after a company goes out of business.

— A. A. —

"Some time ago you collected some money for me, and I would like to tell you how much I appreciate this service, as well as all the nice things in the whole magazine. We have been subscribers for years."—Mrs. M. W., New Hampshire.

Student Killed As Car Hits Tree

Massachusetts Man's Car Swerves off Highway

MENDON, Tuesday—Seth Schofield Kelly, Jr., 21, of Elm street, East Blackstone, a junior at Cornell University, was killed early yesterday when his car failed to make a curve on Providence road, opposite the home of Walter Yanski, left the highway and crashed against a tree.

Officials believed Kelly fell asleep at the wheel.

Dr. John R. Cicchetti of Milford, medical examiner, who was called to the scene at 3:30 a. m., attributed death to a fractured skull and internal injuries.

Was on Way Home

The accident came on the 23rd wedding anniversary of the victim's parents.

Young Kelly was en route to his home from Westboro where he had been visiting Christmas night.

Mr. Kelly told officials that he went out to seek his son at the request of his wife, who is ill, because it was unusual for his son to be out at such a late hour.

Kelly, police said, had evidently been dead for some time before his body was found by Elgar Bartlett of Hartford avenue west, this town, who was driving toward the center of the town. The Kelly automobile was off the road about 12 feet in a sparsely settled section and not readily seen from the traveled way. Kelly was partially thrown out of the automobile by the impact.

Gulf's *GREAT NEW* No-Nox

DESIGNED FOR TODAY'S POWERFUL NEW ENGINES!

Today's new cars have the most powerful engines ever made. AND—

They require a super anti-knock gasoline.

Such a gasoline is the new No-Nox. It was especially designed by Gulf scientists—working hand-in-hand with leading automotive engineers—to give you maximum performance in your new car.

With a gasoline like this great new No-Nox, you can be sure your new car will perform at its brilliant best.

And the new No-Nox not only gives new cars peak performance. It also gives new life, new pep, and stops knocks in older cars too—even many with heavily carboned engines.

So no matter what model you drive, get a tankful of the new No-Nox today.

See for yourself what a difference it makes!

Whisper-Quiet, Knock-Free Power!

Easy, Fast-Firing Starts!

Quick, Safe Passing!

Unexcelled Mileage!

Good Gulf
(our "regular" gasoline)

is better than ever, too!

Good Gulf has also been improved to bring you better all-around performance.

For years Good Gulf has been a favorite gasoline with farmers from Maine to Texas—and now it's even better than ever, whether you use it in cars, trucks or tractors.

Get a thrifty tankful today—for sure, easy starts and smooth performance!

THE FARM PAPER OF THE NORTHEAST

MILLIONS for FRILLS— Pennies for Milk

THE liquor business of the United States spent over \$29 million for advertising last year. The tobacco industry spent almost \$40 million. \$76 million was spent for advertising toiletries and toilet goods. Over \$12½ million went for advertising candy and soft drinks.

I can find no figures showing the total spent on milk advertising, but the estimates I got from people who ought to know place the amount spent for advertising milk at around \$10 million. \$29 million to get people to drink more booze; \$40 million to urge them to smoke, and only \$10 million to get them to use the finest food in the world! No wonder the dairy business is almost always in the dumps!

Most of the money spent for advertising industrial products is spent by manufacturers. Dairymen are really the manufacturers of milk, but it is the retailers, *not the dairymen*, who spend most of what is spent for advertising milk.

No other product has the possibilities for appealing advertising that milk has. If anywhere near the money used to advertise other

By
E. R. EASTMAN

products was spent on clever milk ads, we could double the number of cows in America, and we wouldn't have half enough milk to go around. And the increased consumption of milk could do more for the people's health than all the drugs in the drug stores!

Just the other day a subscriber wrote to me criticizing some milk advertising that he had heard over the radio. He said it was dull and unappealing, and he was right. We not only need to raise and spend more money for advertising milk but we need to dramatize milk. There is little use in telling a boy that he should drink milk because it will improve his health. That's dull. But show that boy dramatically, by the same skillful appeals as are used for other products, that lots of milk will make him a better football or baseball player and he will need no urging to reach for more milk. Can you imagine what would have happened to milk consumption if Pop-Eye the Sailor had drunk milk instead of eating spinach?

Almost every person over fifty begins to generate various kinds of aches and pains. Dieticians and other scientists are agreed that liberal supplies of milk, even up to two quarts a day, are the best insurance for maintaining health after middle-age. But milk advertising must have dramatic appeal even for adults if it is going to be effective. It is the responsibility of you dairymen, the real manufacturers of milk, even more than that of dealers or retailers, to raise the money and to see that a competent job of advertising in all its different forms is done.

I am going to conclude with a very emphatic statement which may make some of

♦ Are you one of those dairymen who send the last possible pint of milk to market, while complaining about the amount your wife wants to keep at home? If milk is a cheap food for city consumers, it is doubly cheap for farm families.

If you want your boy to drink milk, tell him that it will make him strong and healthy so he can play basketball, football, and baseball better. Boys do not drink milk just because they are told it is good for them.

you mad. I am sorry if it does, but I must say it. Since I was a small boy, I have always been interested in the welfare of dairymen. From personal experience I know what the problems are. *But you cannot help people who won't help themselves!* In fact, there is no real permanent help except self-help. Therefore, a dairyman who does not think enough of his own business and his own products, to say nothing of the health of his family, to make sure that his family uses milk, butter and cheese to the limit, has no complaint coming about milk prices! There would be no surplus problem if the farmers who are now buying oleo used butter instead, and if every dairyman saw to it that every member of his family used at least a quart of milk a day.

In addition to the benefits to the family in the way of health, there is no food that is cheaper than milk at the wholesale price. Why sell it and then buy food for your family at retail?

And last and most important of all, unless dairymen are willing to do their part to contribute a few pennies to advertise the fine product which they produce, I see little hope for the future of the dairy farmer.

Money-Saver

A growing pullet on good green pasture is saving money with every blade of grass she eats, every ray of sunshine she soaks up.

She'll save even more if you feed her G.L.F. Green Pasture Growing Mash.

Green grass is cheap. Sunshine is free. Sunshine and grass provide a lot of the things growing pullets need—including many of the vitamins that cost real money when mixed into the mash.

That's the idea behind Green Pasture Grow-

ing Mash. It was developed especially for pullets on pasture, so the things the birds get from grass and sunshine are left out.

Saving—more than \$3.00 a ton.

Summing up—pullets on pasture eat less purchased feed, especially less mash. And they grow fully as well on a lower cost mash. These savings altogether add up to \$10.00 to \$15.00 per 100 pullets.

Cooperative G.L.F. Exchange, Inc.
Ithaca, New York.

Rambling Around New Jersey

By H. L. COSLINE

DOWN in New Jersey the other day I stopped at Hidden Acres, the farm of John Thatcher, located near Washington. With me was Don McKeeby, teacher of vocational agriculture in the local high school. John has been grass farming

Tunis Sweetman milking one of his Saanen goats.

for 10 years and says that he hasn't used a plow in all that time.

As we visited, I noticed a pile of concrete staves at one end of the barn and upon inquiry I found that Mr. Thatcher hasn't had a silo and hasn't put up grass silage, but that he is going to this spring. Heretofore his grass program has been restricted to hay and pasture. Most of his land has been in orchard grass and ladino which, as he said, "gets better every year." Up to now his management has consisted of pasturing early and making hay later.

Now with 53 milkers on 115 acres he will pasture 20 acres early and will put the first cutting of the balance of the crop into the silo. "The grass silage will be put in with a field chopper," said Mr. Thatcher. "I'm going to use 60 to 80 pounds of molasses per

ton and next winter I am planning, if present prices continue, to feed my cows on 18 cents a day for concentrates bought. I am going to feed a 16% ration at the rate of 1 pound to 4 pounds of milk."

At the farm of George Boersma, Tunis Sweetman, who has worked there for some years, has the privilege of keeping goats in the basement of the old barn. Tunis had the opportunity to buy out a herd with equipment and now owns 27 goats, part Toggenbergs and part Saanens. "It is a little difficult to get started in the milk goat business," said Tunis. "First it is necessary to have a license. The goats must be T.B. and blood tested, and you have got to have a market for the milk. I have the market just as soon as one or two details can be ironed out, and the price I will get is 30 cents a quart. The consumer pays about double that."

Contrary to the common idea, goats are not "smelly." They are clean and affectionate. Each goat will give from 3 to 4 quarts of milk a day.

If any reader is interested in raising goats we would just like to point out that there is no established market for goats' milk, and the first necessity is to find or develop a market for the milk.

I rode with Dick Lippincott, County Agricultural Agent in Mercer County, New Jersey, while he took soil samples from a couple of potato farms. Similar samples are being taken every week on several farms in 3 counties in the central part of the State. Samples are

A SERIOUS MENACE

OWING to the very serious and dangerous situation that has developed in New York State from rabies in foxes, the last session of the Legislature appropriated — and the Governor approved — \$60,000 to be shared on a 50-50 basis among the counties where rabies is prevalent, for the purpose of hiring trappers to get rid of this costly menace.

During 1948 the Veterinary College at Cornell examined and found rabid 258 foxes; also, 243 for the first eleven months of 1949. During the past five years, 1,235 rabid cows have been destroyed or have died. Many other animals, including dogs, cats, raccoons, skunks, rabbits, deer, sheep and horses have died from the disease, practically all of it contracted from rabid foxes. Animals contracting the disease die in a few days, but before they die they travel many miles and continue to spread the disease. The above figures, of course, do not cover half the story, for most wild animals die from the disease before they are discovered, and many rabid foxes are killed and not reported.

There are 20 or more counties in central New York where the danger from rabid foxes is very real, but so far Tompkins County is the only one to take advantage of the liberal State help. The health authorities and the Board of Supervisors in Tompkins County and the State authorities are to be highly commended for taking definite action to clean up the rabid foxes, but no one county can do it alone. A definite responsibility to take action rests on the leaders of all counties where this disease is rampant. If you live in one of these counties, talk to your supervisors about it. Your animals or you or your children may be the next victims.

YOU SHOULD HAVE IT

THE best book on credit service to farmers that has ever been published is just off the press and is called "Financing the Farm Business." It is written by I. W. Duggan, Governor of the Farm Credit Administration, and Ralph U. Battles, Assistant Chief of the Economic and Credit Research Division of the Farm Credit Administration. Although written by officials of the Farm Credit Administration, "Financing the Farm Business" is a very fair treatment of all the services, public and private, which loan money to farmers.

The book is written primarily for use in vocational classes in agriculture in the high schools of the United States, but because of the importance, particularly now, of farm finances, every farmer in the United States ought to read it. Certainly every person working with Farm Credit or in private banks doing business with farm people should have the well-written, easy to understand information that this book contains.

"Financing the Farm Business" is published by John Wiley & Sons, New York City, and can be had either from your book store or direct from the publisher.

SMELL OF IT!

ONE DAY years ago when we were first married and trying to get a start in life, I took the milk from the forty-cow dairy on our rented farm to the milk station. The manager yanked off the covers of the milk cans, smelled the contents, clamped the covers back on, told me the milk stunk and to take it out of there.

The loss of that milk was a bad blow and I have never forgotten it. Dealers and milk plant managers are more understanding and tactful now, but frequently we get letters from dairymen complaining that the milk plant has returned their milk because of "off" flavor.

The milk plant manager is usually right, for milk and butter quickly take up unsavory odors. They can be caused even by what the cow breathes and, of course, by what she eats or by some trouble in the udder. Certain weeds like leeks in the pasture will do the trick, as will silage and even some good

pasture legumes such as fresh clover and alfalfa.

A little prevention may save dollars. You cannot follow a cow around the pasture lot, but you can bring the cows in out of the clover or alfalfa for a couple of hours before milking. Silage should not be fed within four hours of milking; if it is frozen, it should not be left to thaw near the cows. Utensils should be clean, of course. Cows that are nearly dry very often give "off" milk. Smell it. If you don't like it, you can't expect the consumer to.

ARE YOU GROWING WITH OR AGAINST THE YEARS?

A FEW DAYS AGO a friend and I agreed that life would be easier and more pleasant if everyone could live out their allotted life span without any aches and pains, and be as strong and able to work at ninety (if one lived that long) as at twenty. Unfortunately, the process of aging begins even before birth and continues much faster after forty.

Doctors and scientists have conquered or controlled many diseases, so that the average life is years longer than it used to be. There are now in America more than 10 million persons over 65 years of age, and the Pennsylvania Medical Society estimates that thirty years from now over half of our people will be over 45. That means a tremendous problem of social and economic adjustment.

Most of these adjustments must be made by the older people themselves. My Mother knew how to do it. She had a frail, ailing body, broken down at fifty, chiefly by overwork; yet she lived to be 83 years of age and was about the happiest person I have ever known. She did it by developing many new interests. Her house was a regular museum. Her will to remain alive kept her alive. Her philosophy was well expressed when one day riding with me past the family cemetery she shook her fist at it and said: "You aren't going to get me yet!"

The time comes for all of us when we cannot do the physical work that we did when we were young. But discontent and unhappiness need never come to any of us if we substitute new and easier activities for the old ones that we can no longer carry on, if we continue to look on life as a great and interesting adventure, and if we have an abiding faith that this life is just a prelude to something bigger and finer to follow.

EDITOR EMERITUS

AFTER more than sixty years of editorial work, E. S. Bayard, Editor of the Pennsylvania Farmer, has retired from active duty and has been granted the title of Editor Emeritus, the first time such a title has been conferred on a farm paper editor.

The honor is well deserved. Few if any farm paper editors have contributed more to the progress of their own state than has Editor Bayard. We wish for him long years of continued activity and fun, and the happiness and contentment that come from such activity and good health.

Succeeding Mr. Bayard as editor of the Pennsylvania Farmer is M. C. Gilpin, a long time member of the editorial staff. Mr. Gilpin will continue the policies that have made the Pennsylvania Farmer a most excellent farm publication. We extend to him congratulations and best wishes.

WHY NOT?

THERE WAS A TIME no doubt when Northeast farmers were justified in leaving to the West the production of pork, even the pork they needed for their own tables. But now consider these facts:

1. Meat prices are about the highest in history.
2. A large number of farmers now have freezers, or at least access to a public locker plant. If you don't want to butcher your hogs yourself, the locker

management will pick them up, do the butchering, process them and return the meat all ready to put in your own freezer.

3. It is possible now to raise hogs on good pasture without too much expense and get better quality meat than you can buy. By using hybrid corn varieties, almost any eastern farmer can raise enough corn to fatten two or three hogs after they have been on a good pasture all summer.

Why not give some thought to raising your own pork?

CAN YOU BACK A HAY LOAD WITH A TRACTOR?

YOU of the older generation will remember the pride you and your neighbors took in the hand skills of the horse and buggy days—the ability to swing an ax and fell a tree within a few inches of where you planned; the skill to swing a cradle all day, leaving the grain in a perfectly laid swath, and a hundred other skills needed to accomplish the many and varied farm jobs of that day.

Now that the old skills have passed, don't forget it takes even more skill than ever to do a farm job in this mechanical age. In Pennsylvania recently, some Future Farmer boys took part in a contest in backing up, belting and stopping a tractor, and in spotting the drawbar. I was born too late ever to learn to back a tractor on a load of hay up a grade on to a barn floor at the first trial, or to spot a manure spreader exactly where it is wanted without taking longer than one should to do the job.

Milking a dairy with a machine on a fast milking schedule is a skillful job. So is good tractor plowing. If you don't believe it, ride some distance at plowing time and note the sloppy job that has been done in too many instances.

Yes, the old skills are gone, but farming today requires more real skill than ever.

WATCH OUT!

SOME OF both the old and new spray materials are highly dangerous and one cannot be too careful in handling them. Here summarized are some cautions that might save you from tragedy:

1. Read carefully the manufacturers' directions.
2. Never spill or leave poisonous material where any animal can eat it or lick it.
3. Watch that drifting or wind-blown spray material does not settle where animals can eat it.
4. Wear protective clothing.
5. Keep hands away from mouth.
6. Wear rubber gloves.
7. When through, change clothes and wash hands and face thoroughly.

EASTMAN'S CHESTNUT

IN THE LAST ISSUE I stole a couple of good stories from Carl Carmer's book, "Dark Trees to the Wind." Incidentally, this book is full of stories about the kind of folks you and I have known and loved all of our lives. Get a copy and read it.

Well, after the last issue of *American Agriculturist* was out, a friend wrote to say that Carl's stories were rightly named chestnuts, so here's another which I'll bet you haven't heard:

"The Averys were giving a large party one afternoon in their sumptuous, begabed cottage on the high bluff above the waters of a Finger Lake.

"'Here comes Cap'n Tom's sight-seeing boat,' said Ed Avery to all of his high-toned guests, 'with Cap'n Tom himself at the megaphone. Very salty and pungent fellow, Tom! Never says the same thing twice. Now keep still and listen to him and you'll hear something worthwhile.'

"So the party quieted down and sure enough in a few moments up over the bluff came a cracked, nasal bellow:

"'Estate of old Ed Avery,' shouted Cap'n Tom. 'Married rich an' ain't done a lick of work since.'"

AA's Farmers' Dollar Guide

CROP PROSPECTS: WHEAT: The latest winter WHEAT estimate of 690 million bushels is 24% below last year and smallest since '43. In New York, winter grains made little growth in April. Indicated production of 10,500,000 bushels of winter wheat in New York is 10% below last year.

HAY AND PASTURES: In New York, HAY and PASTURES started slowly. Poor outlook for new seedings and hay carry-over 40% below last year are causing some worry. Stocks of hay are low all through Northeast. On May 1 the condition of the hay crop is reported between 78% in New York and New Jersey and a high of 91% in Massachusetts, with all states poorer than last year.

GRAIN: OATS and BARLEY were in late. In the Northeast, CORN will be planted late and, unless season improves, acreage may be cut.

FRUIT: Indicated U. S. PEACH crop is 6,822,000 bushels as compared to last year's crop of 12,940,000 bushels. In New York, Hudson Valley peaches suffered heavy damage in February and there was spotty damage in western New York. Peach bloom was light, probably due to dry weather last summer.

Up to May 1 growers reported little winter or frost damage to APPLES, BERRIES or sour CHERRIES. Bloom is very late. This is the off year for many Baldwin orchards. National prospects for 1950 apple crop continue fairly favorable.

In early eastern STRAWBERRY states the crop was hurt by frost in April. In New York, May 1 conditions indicated a crop 20% above last year, which was very poor. In New Jersey, yields are indicated at 17% below last year.

MAPLE PRODUCTS: For 10 maple-producing states, 1950 syrup production was 20% above a year ago. In New York, syrup production was 632,000 gallons; last year, 538,000. Sugar, 49,000 pounds; last year, 28,000. Vermont, syrup, 762,000 gallons; last year, 554,000. Sugar, 158,000 pounds; last year, 195,000.

DEFICITS: In a recent speech, Senator Taft made graphic reference to government spending when he said, "Every time the sun sets, our government is 15 million dollars deeper in debt. How long can it last?"

Deficit spending is one of biggest factors tending toward inflation. Inflation causes labor unrest and demands for higher and higher wages. "White collar" salaries lag behind rising prices. Aged citizens who have saved for retirement are robbed of part of those savings. Individuals are encouraged to borrow too much money. History shows that eventually bust follows boom. Echoing Senator Taft we say, "How long can it last?"

FEED COSTS: In April, 100 pounds of milk would buy less grain than in any April since 1938. Purchased feed makes up about one-third of cost of producing milk and about three-fifths of cost of producing eggs. The late spring should make every dairyman and poultryman consider production of adequate home-grown feed.

FARM PROGRAMS: New "farm programs" are already being talked. Most carry some provision for fees paid by farmers to lessen government cost. One basic fault, as always, is that any plan will be administered by men who want to keep their government jobs.

ODDS AND ENDS: Congress may extend social security to hired labor on farms. Will not carry unemployment benefits, and will not apply to self-employed farmers.

Cash farm receipts for 1950 are forecast at 25 billion dollars; last year \$27.5 billion.

U. S. wool growers are supplying only 40% of domestic requirements.

Big 1950 bug crop is expected. Reason—the mild winter. Damage may total \$2 billion.

Congressional committee is looking into cost of "G. I." insurance. Claim is made that in spite of recent dividends paid to service men, National Service Life Insurance has cost taxpayers \$5 billion since it was set up.

ISOTOX Dairy Spray gives Mr. Rees exceptional results on flies, maggots:

Springrove Farm

TEL. HOLLY 2586

12610 HOLLY ROAD
R. NO. 1, HOLLY, MICHIGANALBERT F. LEHMANN, PROP.
JOHN REES, MGR.

California Spray Chemical Corp.

Dear Sir:

On August 12, 1949 our barns were sprayed with Ortho Isotox. One was the dairy barn the other was a pen barn for young cattle, in both barns the kill was excellent. In the pen barn there was larvae in the litter, which were killed when the litter was sprayed. In the first part of November it was extremely warm days and cool nights, the flies would come into the barn at evening and land on the walls or ceiling and die from the effects of the residual spray that was still active from twelve weeks before.

We are very well satisfied with Isotox and will use it each next year

Yours truly
Robert C. Rees

Robert Rees is Herdsman at the Springrove Farm, Holly, Michigan

MR. REES got unusual residual control. Dairy men from all parts of the country are reporting exceptionally fine results with ISOTOX Dairy Spray. Many claim ISOTOX gives them the best fly control ever. Get the facts—write today to nearest address below for free illustrated folder on low cost ISOTOX Dairy Spray with USDA-approved LINDANE.

So powerful, a little goes a long way!

ISOTOX Dairy Spray containing lindane is available as a wettable powder or liquid emulsion. Use wettable powder at rate of 10 pounds to 100 gallons water. Use liquid at comparable low dosage. Roughly, 1 pound powder or 1 quart liquid makes enough spray for average barn. ISOTOX Dairy Spray is packed in convenient small and large sizes. It is also available as a dust

Also controls mange, lice, ticks and many other pests

DEALER INQUIRIES INVITED

The Song of the Lazy Farmer

THERE was a time when I was young I would have more than gladly wrung the neck of ev'ry dog-goned hen out in Mirandy's chicken pen. Each bunch of birds she got, you see, meant lots of extra work for me; 'twas I who paid the bill for chicks and struggled with the brooder's tricks; 'twas I who left my bed at night to see that heat was still all right; 'twas I who furnished all the feed to satisfy each pullet's greed; 'twas I who weekly had to scoop a ton of litter from the coop; and if, by chance, some eggs were laid, Mirandy got what cash they made.

But nowadays the system's changed, the whole routine's been rearranged. Electric brooders purr along, it's seldom anything goes wrong; the house gets cleaned just once a year, there's nothing 'bout the chores to fear, 'cuz feeders hold a week's supply, the pipe-fed fountains can't run dry. Each high-producing pullet lays so well Mirandy gladly pays for her own chicks and for

the feed, and there's no longer any need for me to sit up with the sows or struggle with a bunch of cows; now I can rest my back and legs, and live off of Mirandy's eggs.

HERE IT IS . . .

Here's the farm building buy of the year—the exciting new, low-cost, all-steel Quonset 24 Special! It's easy to buy, easy to erect, easy to maintain—framed with extra-sturdy N-A-X alloy steel* for extra years of usefulness.

And that isn't all! The Quonset 24 Special is fire-safe, wind-resistant—makes every inch pay off. There are no interior pillars or posts to take up space—no danger of rot or unsightly sagging. It's the permanent answer to your implement and livestock shelter problems...can be built to any length to suit your needs.

See your nearest Quonset dealer today. Ask for full details about the Quonset 24 Special—the all-round building for year-round service!

Using Starter Fertilizer for Hay and Pasture Seedings

By George Serviss

A LUSH seeding of a hay or pasture mixture high in legumes means extra dollars in the dairyman's pocket. Such seedings not only mean more milk, but lower production costs and higher yields of the following crops. Unfortunately, dairymen do not always obtain such stands whether they seed in the spring or summer, or with or without a nurse crop. We know many of the reasons for seeding failures, but we do not know all.

We know that in the Northeast insufficient use of lime is the most important reason for poor seedings. We know that inadequate fertilization with phosphorous and potash contributes to poor stands, lack of persistence and low yields. Other important factors that make for poor seedings are nurse crop competition, deep coverage of seed, seedling diseases, and lack of moisture. All of these things, except nurse crop competition, affect summer seedings as well as spring seedings.

The value of a small amount of starter fertilizer applied close to the seed or to transplants for many crops has been known for many years. This holds true even where the general level of soil fertility is high. A little, but not too much, readily available plant food that seedling plants can quickly reach is extremely valuable. The major part of the fertilizer, though, should be applied in some other way. Corn is one good example; a small amount of fertilizer applied in the row or in the hill gives excellent returns. Another good example is tomatoes; a small amount of soluble fertilizer in the transplanting water starts the plants quickly and increases the yield. Not much attention, though, has been given the use of starter fertilizer for pasture and hay seedings until recently. Some work was done but either was not followed through or not given the necessary publicity. Recently the Ohio Agricultural Experiment Station conducted such work and has published the results. The results are really startling. Starter fertilizer does the same job with legume and grass seedlings as it does with other crops.

Best results were secured when the fertilizer was placed directly under the seed at a depth of 1½ inches. Locating the seed in this position is somewhat of a problem. In these experiments it was accomplished by putting garden hose extensions on the seed tubes and wiring them on the rear of the drill foot. About 200 pounds of fertilizer per acre was used. The grades that gave the best results were phosphate and potash mixtures. It should be remembered that that quantity of fertilizer is purely a starter and not sufficient except on soil in a high state of fertility to carry the crop for any length of time. For those who are having trouble getting good seedings, we suggest this as very worthy of a trial. Tests to date indicate that a fourth to a third less seed may be used.

August and early September seedings of alfalfa are usually successful in parts of the Northeast that are not too far north or the soil not too poorly drained for winter wheat to do well consistently. In the western New York wheat belt September is too late for best results, but in southern New Jersey it is not. One should be very cautious of making seedings at this time of year on fields where chickweed is a problem. Ladino clover and the grasses also usually do well when seeded in this period. Our own observa-

tions over a period of several years indicate that red Clover and alsike are not so likely to catch well. Some, though, feel differently.

—A.A.—

LADINO ROOTS OFTEN GO DEEP

We think of Ladino clover as a shallow rooted crop as compared to alfalfa and red clover. As found from field to field it is, but its roots will go much deeper than most people think if soil conditions are right. For instance on a good deep soil at the University of Illinois, Ladino roots penetrated clear to the water table which was at a depth of five feet. Nodules were found throughout the length of the roots. The character of soil on which a crop is sown often determines not only depth to which roots penetrate, but also character of the root system. Normally, where we have a deep soil we will find crops more "drought resistant" than where we have bedrock or hard pan within a couple of feet of the surface.

—George Serviss

—A.A.—

SIDEDRESSING OR TOPDRESSING

Sidedressing or topdressing crops such as corn or potatoes may or may not be profitable, depending upon soil or weather conditions, according to J. B. R. Dickey, former Pennsylvania Extension Agronomist. Nitrogen, he points out, is the most effective material, and to a lesser extent, potash. In wet seasons much of this soluble plant food is washed out or leached down out of reach of the plants, especially on very light soils. In dry seasons, however, late application may not wash down far enough.

On the heavier, more fertile soils, side- or topdressing may be disappointing, especially with the potato crop where too much nitrogen late in the season stimulates vine growth and often results in a light set of tubers. With corn the color of the stalks will indicate whether extra nitrogen is needed. If deficient in nitrogen, it will lack the desired dark green color. Sidedressing should be applied to corn not later than the second cultivation.

MAKE WAY FOR BEEF! Here is herdsman Don Hollingsworth and a 3-week-old heifer calf, one of the first products of Sperry Farms, Greenwich, N. Y., where Polled Shorthorns have taken over 100 acres of renovated land which was formerly a run-down apple orchard. From a start with three dozen cows and four bulls, owner Harry Sperry has been building up the herd which he hopes to make the largest of its breed east of the Mississippi.

—Eleanor Gilman

A Permanent Trench Silo

Designed To Fit Bay Stater's Labor Saving Program

By Jim Hall

JOHAN D. HOLOPAINEN and his son, Weikko, of Hubbardston, Worcester County, Massachusetts, wanted storage space for their grass silage designed so that one man could fill it without manual labor. From material they read and visits to other farms they reached the conclusion that it was a trench silo they

back and forth so that their working platform would be just where they wanted it.

From the two-foot thick footing the walls slant to an 8-inch width at the top. The concrete was poured in 30-inch layers and during the pouring, each layer was secured to the next by steel reinforcing that consisted of any junk steel they could find. Weikko says that were they to do it again, they'd pour the concrete-stone mixture the entire height of the 12-foot walls and have it no thicker than 12 inches at the bottom.

The sides, floor and one end of the silo are solid concrete with the walls slanting from 13 feet apart at the base to 16 feet at the top. At the open end, nearest the barn, concrete corners were formed to support the sectional frame partitions that are put in as the silo is filled. These partitions rest against 5 by 6-inch oak timbers that span the width of the opening.

(See illustration.) Because the walls slant outward from the bottom to the top, these timbers and the partitions can be raised just a few inches and

No scaffolds had to be erected to build this trench silo. The Holopainens used the floor of the truck and then a platform laid across the top of the stake body as a mobile working platform.

needed but that it had to be permanent. They didn't want to dig the silage out from under snow, and they didn't want to have to rebuild the sides and bottom after spring rains.

Choosing a site at the base of a sloping field about 70 yards from the barn, they went to work in the stony soil and scooped out their trench with a rented bulldozer. Because the land was so stony, they started using the stones to lay up walls two feet thick at the base. By the time they had the two 61-foot long walls built up to four feet, they knew that type of hand work would take too much time, so they changed their plans, built forms and finished the job with transit-mixed concrete to which they added equal parts of stone.

Instead of building a scaffold to work on forms, they worked from the truck platform for the lower levels and then from a platform laid across the top of the stake body. There was ample room in the trench to move the truck

Oak timber locked behind the concrete corners at the open end of the silo hold sectional partitions that are easily removed as silage is fed out. Using a dump truck, John Holopainen needs no assistance to back up to the side of the silo and empty the load in a few seconds.

tossed out as the silage is fed.

To get better traction when taking out silage by power loader, the floors were made rough, but Weikko has found it more efficient to chop down through the silage with an ax and throw the layers of silage on a dump-trailer with a hand fork. This is the only hand labor in their silage operation and takes less than 15 minutes morning and night. The silage is dumped from the trailer into bunks at the barn.

To protect the silage from weather, the Holopainens built a sectional roof of 2 by 3-inch rafters and 1 by 3-inch

The completed silo with sectional frame and aluminum roof easily removed for filling operations.

For **MASTITIS** Use

The Golden Drug Famous in Human and Veterinary Medicine for Its Broad Activity

VETERINARY AUREOMYCIN OINTMENT For Udder Infusion combines safety with effectiveness in treating mastitis.

You will find AUREOMYCIN OINTMENT

- QUICKLY RETURNS COWS TO PRODUCTION OF SALABLE MILK
- MORE EFFECTIVE THAN PENICILLIN
- ACTIVE FOR MORE THAN 48 HOURS
- WILL NOT INTERFERE WITH REGULAR MILKING HOURS
- FLOWS FREELY AND SPREADS RAPIDLY THROUGHOUT THE UDDER
- REQUIRES NO SYRINGE OR MILK TUBE
- PACKAGED READY TO USE, WITH SMALL ROLLED-IN INFUSION TIP, AND FULL INSTRUCTIONS FOR PROPER USE

For maximum efficiency in the use of AUREOMYCIN OINTMENT For Udder Infusion and best management practices and disease-control procedures for avoidance of reinfection, consult your veterinarian.

VETERINARY AUREOMYCIN OINTMENT may also be used for the prevention of superficial udder and other mastitic infections. When injuries to the udder or teat occur, it is advisable to apply this ointment locally to the wound and at the same time infuse each quarter adjacent to the wound with one full tube of AUREOMYCIN OINTMENT as a preventive measure.

In cases of acute septic mastitis, in addition to udder infusion, the injectable form of SULMET* Sulfamethazine Lederle should be used, by or on the advice of a veterinarian. Subsequent treatment may be conducted with SULMET OBLETS,* preferably under the direction of a veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

Finer Hay with Fewer Man-Hours

New Idea Tractor Mower available in manual or hydraulic lift models — gives you greater efficiency for every mowing job — from cutting hay to clipping hilly pastures and controlling roadside weeds. Easy to service anytime.

that's why a **NEW IDEA** is a good idea!

Hydraulic Lift Model Mower — now available. Adds even greater convenience for raising or lowering cutter bar. Permits positive, easy control of sickle at varied heights from ground.

Sturdy New Idea Cylinder-Pushbar Hay Loader — eliminates threshing, jamming and leaf loss. Saves valuable short pieces.

Brand-New New Idea No. 175 Elevator—elevates baled hay—Handles ear corn, small grains, filled sacks, boxes, etc. — at lowest cost.

Mail Coupon Today for Free Folders!

Watch those windrows roll up behind you — formed in a jiffy and just right for drying — when it's a New Idea Side Rake on the business end of your tractor. Tough but non-digging double-curved teeth lift and lay the hay down gently. They're shock-absorbing and a snap to replace. They give you top-notch tedding action at the touch of a lever. They work to save you work — to protect your hay every foot of the way!

And the tougher the crop . . . the rougher the ground . . . the more you'll appreciate the "extras" built into this reliable 4-bar rake. The extra stamina and steadiness of its rigid trussed-arch frame. The extra-large clearances for freer movement of hay. The extra protection against damage and delay provided by its quick-yielding reel.

Scores of other extra advantages are offered in the NEW IDEA Side Rake, and all other NEW IDEA Haying Machines. Exclusive features that spell extra value and savings. Proved advances that assure finer hay with fewer man-hours! Your NEW IDEA dealer welcomes the opportunity to explain them to you. Fully descriptive literature is yours for the asking.

A FORUM FOR Backyard Gardeners

UNFORTUNATELY the path of the beginner at gardening has a few pitfalls. Farm papers, bulletins and books can be helpful, but nothing is ever truly learned until the student has had experience.

For example, there is the young husband, brought up in a small city but thoroughly sold on the advantages of suburban living, who read that DDT was good for flea beetles on tomatoes and who, without reading the label, sprayed his plants with a DDT spray designed for insects. On his return home that evening he found that they (the plants not the insects) were thoroughly dead. Fortunately the season was still early and the cost of that lesson was the price of some new plants. Learning such a lesson the hard way and applying the new information successfully is as satisfying to a gardener as a "hole in one" is to a confirmed golfer.

Bugs and Blights

One of the most helpful disease and insect control materials for backyard gardens is a general purpose dust containing rotenone and a fixed copper compound. It is sold under many trade names, but if you will read the description and directions you will recognize it. For the backyard gardener, dusting is always easier than spraying. Rotenone will control most insects and the copper will control many diseases. It is not poisonous to humans, so you can use it liberally and often.

Mulch Raspberries

If you have room in your garden for a short row of raspberries, you will find one of the easier ways of maintaining them is to mulch between the rows with weeds, grass or sawdust. The new canes will push up through this mulch without any difficulty and it will help control weeds. Mulch can be added each year as it decays.

Every spring we get questions asking why the tips of some raspberry canes are dying. The damage is done by the raspberry cane borer. If you examine a dead tip carefully you will find that an insect has stung the cane and laid an egg in it. If you do nothing, the egg will hatch, the worm will burrow down the cane, and you will get few or no berries on that cane next year. The control method is to cut the cane below the worm and burn it. If the cane is hollow where you cut it, you haven't cut low enough.

Cross Pollination

If you have a few fruit trees and one or more of them refuse to bear, look into the matter of cross-pollination. Some varieties of fruits are self-fertile but many require cross-pollination from another variety, and others give better crops where there is cross-pollination. If you decide this has been your trouble, there are several remedies. One is to plant another variety near the tree which fails to bear. A quicker one is hang a bouquet of blossoms from another variety in a pail of water in the tree so that insects will effect cross-pollination.

Kill 'Em Young

Farmers know that the easiest time to kill weeds is before you see them, but many gardeners (particularly new enthusiasts) too often wait until weeds are well started before they sharpen up the hoe.

One of the easiest ways to kill weeds in the garden is to use a garden rake

between the rows. It is no harder and just as fast as a wheel hoe, and a rake costs considerably less money. To be effective, begin its use as soon as the plants appear, or even before if you left stakes at the ends of the rows and can stretch a string to locate them so you won't cultivate too close.

Late Plantings

To get full advantage of your garden you will need to make a second or even a third planting of many crops. Among these are snap beans, sweet corn, radishes, lettuce, carrots and beets. Later plantings can be made on ground that has been cleared of such crops as peas, radishes or any others that are off the ground by the middle of June or first of July.

Pruning Roses

It will soon be time to prune roses. There is a big difference in growth habits of roses which we refer to as climbers and those we speak of as ramblers. In the case of ramblers, new shoots come from the roots each spring, and after blooming season the old ones should be taken out right down to the ground. The sooner you do this after they bloom, the less damage you will do to the new growth.

The growth habit of the climbers is entirely different. The new growth starts as branches from the previous year's growth, and the pruning consists of cutting back the branches to a side branch. In a sense, pruning of the climbers is not as essential, but if you neglect them they will develop into a mass of growth that is neither pretty nor fruitful. Here again the logical time to prune is soon after the blooming season is over. Both ramblers and climbers blossom once a year in contrast to tea roses which have several blooming periods. The pruning of tea roses is another problem which we will go into some other day.

Lima Bean Trouble

A friend wants to know why he can't get a good stand of lima beans. Probably the trouble is caused by the seed corn maggot. A fly lays eggs in the seed beans in May. The worm that hatches eats the bean and prevents normal growth. Try delaying planting until the ground is warm and dry. Then if some beans do not come up, replant as soon as you can locate the vacant spots in the row. If your soil is heavy, try putting some peat moss along the row to help prevent a hard crust which might hinder emergence of the limas.

Your letters, whether relating your experiences or asking for information, are welcome. Just write to *American Agriculturist*, Box 367, Ithaca, N. Y.

Visiting Dairy Farmers in Chemung Co., N. Y.

By ERNEST GRANT

NEW, EFFICIENT milk coolers which save lifting are finding their way to many dairy farms. There is one on the farm of Steven Mizio and Sons of Corning, New York.

This side-door cooler holds ten cans, five in each of two rows. The empty cans set on a platform in the cooler. Each one is filled through an opening directly above it. A movable collar fits into the opening and directs the milk into the can. The strainer sets in the opening which is large enough so that the cover may be put on the can through it. There is no need of spilling.

In the bottom of the cooler, beneath the can platform, is a water tank

which holds five gallons for each can. The milk is cooled by water sprayed over the cans from pipes running across the top of the cooler.

There are two motors, one to pump the water over the cans; the other runs the pump which refrigerates the water in the tank below.

Mr. Mizio and his sons prefer the new type of cooler to the other type where cans are lowered into the water. It saves much lifting. The cans are placed in the cooler while they are empty. They are removed through the door in the side and do not have to be lifted up over the side of the tank.

The thermostat can be set for the desired temperature and operates automatically. Its efficiency is shown by an example given by the Mizios. One day last summer the morning milk was cooled to 56 degrees before the barn chores were done and the men went into breakfast.

HEATS WATER FOR COWS

BENJAMIN HILL, Jr., of Chemung, Chemung County, New York, has a fifteen-cow herd of high-producing Holsteins. He remodeled his stable last fall but didn't get the drinking cups installed before cold weather set in. He had to water his cows at a watering trough in the barnyard.

To keep the water from freezing, he set a bucket stove in one corner of the trough. The stove is built with a fire pot large enough to hold several large sticks of wood. A tube down one side to the bottom admits air and provides the draft. The stove extends several inches above the top of the trough.

On mild winter mornings Mr. Hill builds a fire in the stove when he finishes milking. By the time the cows are turned out, any ice is gone and the water in the tank has been warmed to a temperature so that the cows can drink with comfort. That they like it is proved by the amount that they drink—almost twice as much as when the water is ice cold. On extremely cold nights he builds a fire, shuts off the draft, and keeps ice from forming on the trough.

Mr. Hill has found that the cows drink the warmed water faster too, and he can water them in less time.

When they have all they want, milk production stays up. When they don't get all the water they want, milk production goes down.

Although he likes the system better than letting ice form on the trough and giving the cows ice water, and it has paid dividends, he will install drinking cups in the stable as soon as warm weather comes.

SOCIAL ORDER IN THE DAIRY HERD

MR. ELMER WHEATON, Horseheads, Chemung County, has a large pen stable for his milking herd of some sixty cows. The cows are let into the milking parlor one at a time to be milked.

In the winter time when the cows are in the stable all of the time, Mr. Wheaton has noticed that the same cow is always first to be milked and that the others follow in just about (not one hundred per cent) the same order each time.

In spite of this, he has not noticed any bossiness among the cows in the pen.

HOW GOOD IS A BULL?

THE INFLUENCE of just one good bull on the future dairy herd was brought forcibly to the mind of Harry Stowe of Elmira, New York, when he proved his six-year-old bull. Fortunately, in this case the influence was good and the owner was pleased.

Wait Farm M. O. J. Major 873501, a purebred Holstein bull, was proven in 1949 at six years of age. The first eleven dam-daughter comparisons showed that his daughters averaged 13,070 pounds of milk and 490 pounds of butter fat. This was an increase of 2,065 pounds of milk and 79 pounds of fat over the average record of their dams. Both sets of records were made

Wait Farm M. O. J. Major 873501.

on two times a day milking.

Eleven of Major's daughters are now being milked in Mr. Stowe's herd and he has twelve others coming on.

In addition to siring good producing daughters, Major shows well. He has been Grand Champion Holstein Bull at the Chemung County Fair for five consecutive years.

— A. A. —

GREEN PASTURES NEED FERTILIZER and LIME

New England Green Pastures winners in 1948 used about 1,200 pounds of fertilizer per milking cow. In 1949, the 18 winners increased this average to 1,443 pounds per animal. One of the state winners used 3,400 pounds per cow.

All but two of 1949 winners used super in the manure or directly on the sod. They also applied 0-14-14 and 0-20-20. Few used nitrogen fertilizers because legumes, once established, have a better chance to develop without nitrogen.

Direct from Cow to Milk Can

THE DE LAVAL MODEL F COMBINE MILKER

NO STOOP—NO SQUAT—With the De Laval Model F Combine Milker you don't stoop or squat. You work comfortably erect with udders at chest height for easiest attaching and removal of teat cups—and for close udder inspection.

NO CARRYING—With the De Laval Model F Combine Milker you don't waste valuable time and walk unprofitable miles every year carrying milk from barn to milk house. This Milker does the entire job for you!

• We invite you to take a good look at the simplest, fastest and most sanitary milker you can own. Hundreds of these De Laval Model F Combines have been in use for years...but during the next few years you will see thousands more go into operation, because this is the milker that completely mechanizes your milking operation.

The cows bring the milk to the milker, which delivers it directly into the milk cans in the adjoining milk house. The automatic De Laval Combine can fillers fill one can at a time and cans may be changed without interfering with the milking. The operator does not stoop, squat, carry or pour milk. Result is one-man operation for lowest production costs.

Whether you have a stanchion type barn or loose housing, the De Laval Model F Combine Milker installed in a simple, low-cost milking room will enable you to milk more cows in less time with less help—but with increased profits.

NO BARN ODORS—With the De Laval Model F Combine Milker the milk—from cow to milk can—is sealed during the entire milking process in an air-tight system. Barn odors, dust and other matter are sealed out.

NO POURING—With the De Laval Model F Combine Milker you don't waste your time straining and pouring milk. This modern milker has a built-in filter and empties the milk into milk cans—one can at a time.

Better table fare, at lower cost, with less work, and brought to you by dependable De Laval Speedway Food Freezers, which are designed especially for farm use. Three sizes—8, 16½ and 35 cu. ft.

Excess milk problem grows more acute as flush period reaches peak

THE steadily rising tide of milk which has been overwhelming the market for the last several months is now at its spring crest. Independent producers who have been depending for their market upon dealers' facilities, both country and city; and cooperatives with but a single dealer outlet both face increasing difficulty. More and more unorganized and unprotected milk is being peddled through brokers, in many cases at reduced handling charges.

IT'S THE DISORGANIZED SELLING THAT HURTS

AS LEAGUE spokesmen have pointed out before, it isn't the actual size of the surplus which destroys the price structure, so much as it is the distress selling through channels which have a greater interest in underselling the going market than they have in maintaining a fair price for farmers.

THAT'S why Dairymen's League members, and members of all marketing cooperatives, are deeply sympathetic with the plight of the unorganized producer and are vitally interested in helping him to dispose of all milk produced, in an orderly and reasonably satisfactory manner.

THE LEAGUE'S SURPLUS FACILITIES ARE IN GOOD SHAPE

WHILE many handlers of surplus in the New York metropolitan area went out of business during the great seller's market of the war years, fortunately, the Dairymen's League maintained its surplus facilities, kept them up to date and in some instances expanded them.

THIS guarantees a steady market for League members themselves, and greatly reduces the volume of milk that would otherwise be forced to compete for fluid outlets. It stabilizes the price structure.

UNORGANIZED dairymen throughout the milkshed should realize that it is the off-the-farm facilities of the Dairymen's League which are their greatest protection when milk supply exceeds demand. For the League not only tries to balance production reasonably with demand and to divert milk into the higher-price classifications at all times, but it also maintains facilities for handling a normal surplus in flush months in order that the market may have an adequate supply in times of low production. Protection like this can come only through cooperative effort. The man who tries to go it alone is only thumbing a free ride.

Letters to the Editor

RECOGNIZING SOCIALISM

I HAVE just read a book called "The Road Ahead" by John Flynn. It is about socialism in England and in the United States. Few people realize just how far socialism has gone in this country; in fact, I did not myself. It is the same thing as communism but they call it "Planned Economy."

If you have not read this book, by all means read it and urge every person over ten years of age to read it. It is an eye-opener. Socialism has, of course, been a dismal failure in England. England is now bankrupt and a fourth-rate power.

There is food rationing in England because they are not self-supporting and lack the cash or credit to buy enough. This is some of it: 1½ eggs per week, 3 oz. butter, 6 oz. oleo; 1 oz. lard, 1 oz. cheese, 1 oz. bacon, 8 oz. sugar, 6 oz. meat, 2 oz. corned beef.

They evidently do not classify corned beef as meat. These figures are, of course, for one person.

A force of 30,000 government men have the power to search homes at any time and for any reason without a search warrant. Only 40 people in England have net incomes of \$24,000 or over.

The Brannan Plan is only one of many things now on the fire to bring us to our knees. You and I are old enough so that it cannot hurt us for long, but I pity the young people.

—Philip Plaistrige, Winchester, N. H.

OVER-FED

YOUR STORY about the minister in the April 15th issue reminds me of one I heard.

It seems a young minister was being sent to a small town to preach. He spent a lot of time preparing his talk for his first sermon and made it a point to be there exactly on time. When he arrived at the church there was only one man there.

"Well," the minister said to the one man. "I came here prepared to preach a sermon. What shall I do?"

The man said, "I don't know, as I am only a cow-hand, but if I went down to the corral with a load of feed for the cows, and only one showed up, I sure would feed her."

"If you want to listen to me," replied the minister, "I'll preach you the sermon."

So he went up in the pulpit and started preaching about Hell's fire and brimstone, and what would happen to the man if he didn't walk the straight and narrow path. He preached a long time and gave him the works. After he got through he went down and shook hands with him and asked him what he thought of the sermon.

"Well," the man says, "I am only a cow-hand, but if I went down to the corral with a load of feed and only one cow showed up I sure wouldn't give her the whole load."—H. L. Munsey, Auburn, Maine.

In renewing my subscription to your splendid paper I want to tell you that I wouldn't miss the "Lazy Farmer", which is the best I have seen in any publication. I have known Jared Van Wagenen for many years and he has been my guest time and time again. I know of no man who sees farm and country conditions as sanely as Jared does, and I congratulate you on having him as a writer.—A. C. Hurd, White River Junction, Vt.

These six Future Farmers were among many who won honors at the 25th annual Convention of the New York Association of the Future Farmers of America at Waverly May 11 to 13. Each of them won a \$100-Award offered by the Future Farmer Foundation. From left to right are: Ed Callahan of Corning, Farm Electrification; George Chase of Phelps, Farm and Home Accident Prevention; James Keller of Marathon, Farm Mechanics; Ambrose DeMoise of South Cortright, Soil and Water Management; Arnold Cope of East Springfield, Dairy Farming; Robert Briggs of Davenport, the Star Award as the outstanding F.F.A. member receiving the Empire Farmer degree.

New York F. F. A. Celebrates Silver Anniversary

THE SILVER Anniversary Convention and Celebration of the New York State Association of Future Farmers of America was an inspiring event. Held in the high school at Waverly May 11 to 13, the business of the session was conducted in a noteworthy manner. Officers were elected. National President George Lewis of the State of Illinois was present and as a fitting part of the Silver Anniversary Celebration the founders of the organization were honored.

Honors presented at the annual banquet on Saturday evening, in addition to those won by the boys pictured on this page, were:

Six Empire Farmers who did not receive other awards won \$25 each from the Future Farmer Foundation. They were: David Taylor, Margaretville; Richard Byrnes, Gouverneur; Oscar King, Malone; Robert Long, Waterloo; Charles Dennison, Cato, and Gordon Donahue, West Winfield.

Herbert McFetridge of Geneva received \$100 as winner of the State F.F.A. Speaking Contest.

The New York Central Railroad makes \$50 available to each of two Empire Farmers toward their expenses in attending the National Future Farmers of America Convention at Kansas City. Winners of these are: Stewart Jones, Holland Patent and Eugene Blumer, Mexico. Alternates are William Behling, Weedsport and

Walter Cook, Westmoreland.

The New York Holstein-Friesian Association makes 5 awards of \$30, \$25, \$20, \$15, and \$10 to Empire Farmers who purchased their first purebred Holstein calves after enrolling in vocational agriculture and who have made the greatest progress since that time. These awards in order went to: John Siegel, Holland Patent; Frank Pendell, Whitney Point; Neil Storie, Hammond; Edward Frank, Westmoreland; Dale Stoker, Homer.

The New York State Bankers Association provides tuition and expenses to 2 boys to attend the Bankers' Farm Management School at Cornell in August. Winners were: David Taylor, Margaretville, and George Chase, Phelps, with Robert Briggs, Davenport, and David Grady, King Ferry as alternates.

On Friday evening an outdoor program was enjoyed at the high school athletic field. One of the high points of this program was the recognition of Stephen Salmon, principal of the high school at Vestal, and W. J. Weaver of the State Education Department, whose vision resulted in the formation of the first chapters of the Future Farmers of America just twenty-five years ago.

Also recognized at the meeting were past State officers, past Empire Farmers and past honorary Empire Farmers. Another feature of the evening's program was an amateur contest in which boys from various schools sang or gave solos on various musical instruments. The evening was concluded with a colorful fireworks display provided by Tioga Mills.

The new officers of the Association are: President, Oscar King, Malone; First Vice-President, Charles Dennison, Cato-Meridian; Second Vice-President, Lyle Embt, Alexander; Secretary-Treasurer, Stanley Saxton, Avoca; Reporter, Richard Byrnes, Gouverneur; Sentinel, John Odell, Westmoreland.

Approximately 100 Empire Farmer degrees were awarded, the largest number in any one year. The F.F.A. emblem which accompanies the award is a mark of real achievement, as owners of it have demonstrated their knowledge and in general have built up bank accounts and inventories averaging several thousand dollars. The future of farming in this country is in good hands.

In addition to the students and officers already mentioned, the following received Empire Farmer Degrees at the Convention:

GROUP A

Robert Keller, Marathon; John La-

(Continued on Page 14)

These two New York Future Farmers of America members were presented American Agriculturist Achievement Awards at the F.F.A. Convention at Waverly. From left to right: Arnold Cope of East Springfield and John Fero of Schoharie. This Award is a gold medal presented each year to a number of young people for all-round excellence in community and school activities with emphasis on leadership ability.

Dave Saves the Day

Puts "NEW LIFE" in his trusty Ford!

ON SUNDAY THE GANG IS GOING UP TO SWAN LAKE. WHY DON'T WE GO ANY PLACE ANY MORE?

CAN'T HELP IT, DEAR. WHEN A FORD HAS AS MANY MILES AND YEARS ON IT AS OURS HAS, IT NEEDS REPOWERING

AN AUTHORIZED RECONDITIONED FORD ENGINE COSTS JUST A LITTLE MORE THAN A MAJOR OVERHAUL. AND BROTHER, WHAT PEP IT ADDS TO YOUR FORD!

YOU SAY ONE DAY TO PUT IT IN? GOOD DEAL! I'LL SURPRISE NANCY - I'M GOING OVER TO SEE THE FORD DEALER THIS NOON!

I FIGURE THERE'S NO SENSE IN NOT GETTING THE BEST - THAT'S WHY I CAME HERE TO GET AN AUTHORIZED RECONDITIONED ENGINE FOR MY FORD

YOU'RE RIGHT! IT'S RISKY NOT GETTING THE GENUINE ARTICLE. IT'S LOW-PRICED AND WE CAN WORK OUT AN EASY PAYMENT PLAN FOR YOU

DAVE, IT RUNS LIKE A NEW CAR! WE'LL BE UP AT SWAN LAKE BY THE TIME THE REST OF THE GANG GETS THERE!

YOU SAID IT, HONEY! AND NOW OUR CAR WILL LAST US FOR MANY MORE THOUSANDS OF MILES

YOUR GUARANTEE OF THE REAL THING

- ALL wearing parts and surfaces reconditioned or replaced with new Genuine Ford Parts
- Guaranteed by Authorized Reconditioner against defects for 4,000 miles or 90 days
- See your nearest Ford Dealer or Independent Garage.

Good dairy barn management requires hot water—lots of it!

WHY carry utensils to the house for cleaning and hot water to the barn when your time is scarce and electricity costs so little?

A modern, automatic electric water heater in your milk house will give plenty of hot water for massaging udders, sterilizing milker parts, cleaning utensils, and for washing up.

There's a size and type of water heater to suit every need and budget. Our Rural Service Representative will be glad to help you select the right size of water heater for your dairy. And he can also help plan your milk house wiring so that water heater, milk cooler, milk house heater, and other electrical equipment will do their best.

The Question Box

Can you get a catch of birdsfoot in a pasture by scattering seed on top of the sod?

Generally this is a waste of good money and the practice is one reason for the idea that it is very difficult to get a seeding of birdsfoot. Seedings are not always successful, but a high proportion of them are when directions are followed closely. Briefly, the directions are (1) sow on well-fitted land without a nurse crop or with a very light nurse crop; (2) provide some quick fertility to get plants started, and (3) sow shallow on a firm seed bed and clip weeds if they compete seriously with the birdsfoot.

If 'high analysis' fertilizers are so much in demand, why do manufacturers put any 'low-analysis' fertilizers together?

There are at least two reasons. To some extent the public demands 'low analysis'. In other words, they have not yet been persuaded that 'high analysis' fertilizers are better. Second, the materials used in the fertilizer determine to some extent the analysis. In other words, if you are using low-grade material, you can't get high-grade analysis fertilizer. The possibility of making 'high analysis' mixtures, however, has been greatly increased by development of such materials as ammonium nitrate and triple strength superphosphate.

Is there any practical method of breeding long life into a dairy herd?

Disease, particularly mastitis, takes about as many cows out of a herd as any one cause. There are some new remedies for this disease which will help, but in the long run many believe that it is a question of breeding stamina into the cow so that she can resist infection.

At any rate it is a long-time process, but the necessary steps are to pick animals from families that are long-lived, grow them big, and follow a program of sanitation to control disease.

Can you plant sweet corn of different varieties side by side without affecting this year's crop?

It is not essential that you plant different varieties of sweet corn at a distance. Of course, there will be cross-pollination, but it will not affect this year's corn. However, if you save and plant seed from corn which is cross-pollinated by another variety, you will get a big variation in next year's crop.

What would you suggest as a program in case a man wanted to plow under the highest possible amount of green manure crops in one year?

The problem here is to grow quick maturing crops, get several of them in, and, so far as possible, grow crops where the seed cost is low and perhaps where at least one crop could be sold.

Certainly, if you are starting in the fall, you would want to sow rye and plow under early in the spring. Then you could grow a crop of peas and, if they were picked for market, the vines could be plowed under. You would still have time to put in a crop of buckwheat to plow under the following fall.

I am buying cows to build up a purebred herd and naturally am anxious to avoid buying poor ones. Are there any safe rules I can follow?

If a definite answer were given to your last question, it would have to be "No." Buying cattle is a matter of experience gained through the years. We know of one dairyman who sells surplus stock at the Earlville sale.

Frequently he buys an animal that is selling for less than it is worth, takes it home and brings it back in a month or a few months and sells it at a good profit.

Attendance at good sales will help you. Learn to judge size (other things being equal, a big cow gives more milk); get experience in judging type and study records, not only of the animal you are buying and its dam but also records of close relatives; in fact, of entire families.

If you can get the advice of an experienced breeder, you will find it very helpful.

Is it necessary to fertilize the lawn more than once a year?

Most homemakers who want a nice lawn fertilize both in the spring and fall, and some put on a second spring application in late June. This aids greatly in tiding the lawn over the dry summer months, particularly if you get a rain soon after the fertilizer is applied. The amount recommended is a pound of 5-10-5 or similar fertilizer to every 100 square feet of lawn. A well fed lawn is one of the best methods of controlling weeds.

Somewhere I read figures on the relative cost of feed, pasture, hay, silage, and grain. Do you have these available?

The U. S. Department of Agriculture reports that for each 100 pounds of total digestible nutrients, pasture costs 29 cents; alfalfa hay, 49 cents; corn silage, 91 cents, and barley (grain), \$1.40. This comparison is, of course, rough and is based on yields somewhat above average. Nevertheless, the figures give a reasonable comparison.

I have heard about the use of 'controlled atmosphere' storage for apples. Usually, this seems to refer to McIntosh. Can it be used for other varieties?

While some of the other varieties, for example, Northwestern Greening, Twenty-Ounce Delicious, Rome Beauty and Northern Spy, respond to this treatment it is not as effective as in the case of McIntosh and, in fact, the results make it doubtful whether or not the practice will be profitable on varieties other than McIntosh.

Is there any way to solve one of the big difficulties of ladino clover, namely, the fact that it is very hard to mow?

Many farmers tell us that ladino is easier to mow early in the season, and it can be mowed early where it is used for grass silage. Some farmers pasture it early and then take off the cows and harvest it for hay later. This not only helps the problem of difficult mowing but extends the hay-making season so that the job of haying doesn't all come at one time.

"Did you see any fish when you fell in, dear?"

Hay Hoist Pinch-Hits as Gutter Cleaner

JAMES P. WELCH, who's now doing most of the work on the dairy farm that he and his dad, James T. Welch, own on Route 2 near Troy, Rensselaer County, N. Y., had an idea. To it he added a lot of ingenuity and about \$50 worth of an electrician's labor to produce a power gutter cleaner that is almost as simple as one can be.

In a barn with two rows of cows heading in, young Jay, as his dad calls

rection out through the end of the barn and down to another pulley which can be attached to anchors firmly planted opposite the end of each gutter. The electrician was called in to install remote control switches near each gutter to turn the motor on and off. James built simple clutch controls of cable and pulleys which he strung over each gutter so that he could start, stop, and reverse the winch drum from almost anywhere.

A metal lined chute was built to fit from the end of the gutter to the manure spreader and that completed the installation. Now when James is ready to clean, he hooks the loose end of the cable to a point just above the tines on an ensilage fork and pulls the clutch rope. He holds the fork at the proper angle in the gutter while the motor pulls the fork and all the manure in front of it down the gutter, up the chute and into the spreader. When he has straw for bedding, the rig pulls a real big load, but with the shavings he was using the day the picture on this page was taken, he takes only about a quarter of the 15-cow gutter at a time to avoid having it spill over the edges of the chute. When one gutter is clean, James moves the pulley to the anchor opposite the second gutter, moves the spreader in line and repeats the operation.

Such time-savers as the gutter cleaner and the silage cart he built help give him the time and strength to look after the 40 head of Holsteins, grow the corn and grass silage, grain and hay he needs, and still be able to improve pasture, try a couple of acres of birdsfoot trefoil, and grow some corn for grain. Another labor saver that enables him to get along with only one part-time summer helper is his forage harvester bought last year. He also uses it to work on his uncle's farm in exchange for the use of his uncle's baler.

The Welchs own 80 acres and rent 50 adjoining acres. They did rent as much as 120 but the land is so close to Troy that much of it has been sold off as building lots—going for as high as \$1,400 each. Homes are built up along two boundaries of the farm. The senior Welch said that years ago it was a distinct advantage to be so close to the city to save long hauls with teams, but today's highspeed truck transportation and open highways give him little advantage.—*Jim Hall.*

James P. Welch of Troy, N. Y., rigged a cable to his hay hoist for power to clean gutters. He is shown here just keeping the fork at the right angle as the cable pulls fork and manure. It runs up a chute at the end of the gutter and right into the spreader.

him, found that it was taking too much valuable time to clean two gutters by shoveling manure into a carrier. He already had a three horsepower hay hoist built in the upper part of the barn, so he decided to use the same motor and winch to clean his gutters. It worked out easier than he had hoped.

First he removed the hay rope that ran from the winch through an overhead pulley and into the mow, and substituted a 5/16 inch cable. This cable runs through the same overhead pulley, but is taken in the opposite di-

A PERMANENT TRENCH SILO

(Continued from Page 7)

strippers covered with corrugated aluminum roofing. The sections, light enough for two men to lift off, are bolted together. The materials for the roof cost \$150 and the two men built it in a week. The total cost of the silo, excluding their own labor, was \$974.

Weikko figures that the silo holds between 250 and 300 tons of the high moisture silage they put in, but that isn't enough for his herd of 50 so he plans to raise the walls three feet. The addition will be perpendicular in order to use the same roof, and will add about 50 tons to the capacity.

Finished in time for grass in 1948, the Holopainens filled the silo in 10 days. Weikko would start mowing, with a two-way windrower attached, in the morning while his dad finished up the chores and then, when his dad came to the field with their dump truck, Weikko would switch over to their field chopper long enough to get the truck loaded. While John was tak-

ing a load to the silo, backing up to one side and dumping it into the pit, Weikko would leave the chopper and mow some more.

A light tractor with loader attached was left in the silo from the time they started filling, and each evening Weikko would run back and forth in the trench to level the dumped in piles and at the same time pack the grass. When the filling was completed, he drove the tractor out over the side and they put the roof on. The Holopainens were one of the top 18 winners in the 1949 New England Green Pastures Contest.

—A.A.—

An effective way to cure a horse of the habit of cribbing is to fasten securely a three-inch iron pipe lengthwise on top of the manger, where the cribbing usually is done. After gripping the iron pipe a few times with his teeth, the horse will give up the habit as not worth the wear and tear on his teeth.—*I. W. D.*

DITHANE Protects Your Crops All Through The Growing Season

Potato blight hasn't a chance with DITHANE. Regular DITHANE spraying or dusting protects your crop from disease *throughout the season*—and gives you bonus bushels of finer potatoes.

Reason: DITHANE controls early and late blight *without retarding growth*. On thousands of acres, crops sprayed or dusted with DITHANE have consistently outyielded crops treated with other fungicides—by 40 to 70 bushels per acre.

Because it's tough on plant diseases, yet gentle in its effect on foliage, blossoms and fruit, DITHANE safely controls many diseases of many crops. Tomatoes, celery, cucurbits, onions—all benefit from DITHANE sprays and dusts.

See your dealer for dependable DITHANE dusts and sprays.

FREE—Send for these fact-packed folders. They'll help you grow finer quality crops.

Potato Growers Differ On Proposed Marketing Order

By L. B. SKEFFINGTON

POTATO growers of upstate New York will have a chance to vote on a proposed marketing order. In the absence of any official announcement, pending study of the record, this is indicated. By far the majority of growers who turned up for a public hearing in Rochester favored such an order.

A number of growers were outspokenly against it. Some of these thought certain things should be done for better marketing of potatoes, but they doubted that a federal marketing order was necessary. A few expressed disbelief that such an order could be enforced properly; a few more thought it involved too much control and regimentation of the farmer's private affairs.

Throughout the three-day hearing conducted by the United States Department of Agriculture, I got two distinct impressions:

1. Most of the growers agreed there was something wrong with the potato business. Differences of opinion arose as to what might be done about it; how to control the fellow who will not go along with self-regulation. Only a few thought a marketing agreement without some force of law would be effective.

2. Most of the growers expressed belief in enforcement of grades. There was frequent complaint that the state had not properly or fully enforced grading laws. Most of this group favored compulsory inspection, but there was a split here. Some thought inspection of their own packs unnecessary, too expensive, or that general inspection of all lots would be physically impossible.

TO COST MORE

The final day of the hearing was devoted largely to discussing how inspection might work. The tentative draft of the marketing order was prepared by a committee headed by Harold J. Evans of Georgetown, president of the Empire State Club. The Farm Bureau Federation, Extension Service and other groups participated. The draft provides that where shipping-point inspection is not available, the state administrative office of the marketing order might issue waivers.

C. R. Icenoggle, supervising inspector, USDA, said this could be done promptly by the inspecting office giving telephone permission to move the lot where an inspector would not be on hand. All such lots would be subject to inspection at receiving point or wherever exposed for sale.

Harry H. Duncan, assistant director of the State Bureau of Markets, said considerable thought had been given to expansion of the state-federal inspection service to cover operation of such an order. He said it could be done "if the money is available." He said inspection fees probably would have to be raised as the result of cost studies now under way.

Elmer McCann, Chateaugay grower said he believed in inspection 100 per cent. Edward Gagnier, Cherubusco, said it would assure wider compliance with grades. Jack Bishop, Wayland, was sure it would improve market quality. Wilbur VanMaaren, Honeoye Falls, was equally sure that poor market quality lowers prices.

OPPOSITION VOICED

Phillip Luke, Fulton, said cost of inspection would be prohibitive; that many families cannot afford to buy U.

S. No. 1 Grade. He said "the price support feature alone" was enough to insure his opposition. Although the proposed order does not mention price supports, the Secretary of Agriculture has announced that unless there is a marketing order for the area, there will be no supports available.

Isaac DeHollander, Oswego, president of the State Vegetable Growers Association, said, "Once we have government controls, it will be hard to get rid of them." He doubted that growers would be benefitted, as acreage taken out of potatoes would be put into some competing vegetable crop.

After the hearing it was announced that the record will be studied and possible changes made in the draft of the order to be submitted to the committee for study. Then, if the Secretary so determines, the order will be submitted to a referendum, probably about mid-July.

Season Continues Late

Various estimates are that the spring season, as far as farm work is concerned, is 10 days to three weeks late. Cold nights have held pastures back, and in many cases cows will be weeks later in getting out to grass. A few warm days in early May were interspersed with frosts. Where oats went in late on well-drained land, they came up quickly, although at this writing there were some areas where growers still were hoping to plant.

Whereas in some years corn planting on many farms has been finished by the end of May, there were many where they were just getting started this year. Fruit bloom along Lake Ontario generally is late and there have been no reports of frost damage.

Garman Heads Growers

Cameron Garman of Burt has been elected president of the Western New York Apple Growers Association and Marcus E. Buckman of Sodus, vice-president. Lloyd Putnam, former Niagara County agent, has been hired as executive secretary. About six million bushels have been "signed," and an office is to be opened in Rochester.

LAST CALL FOR MINIWANCA SCHOLARSHIP

In the April 1 issue, announcement was made of our annual *American Agriculturist* Scholarship to the Leadership Training School at Camp Miniwanca, Shelby, Michigan. At that time applications were requested. The deadline for applications has been set at June 10.

All that is necessary is that you write to H. L. Cosline, Box 367, Ithaca, New York, saying that you would like to make application for the Camp Miniwanca Scholarship. In your letter give a summary of your activities in any organized youth groups to which you may belong, with particular emphasis on leadership you have been able to show. Also, give the names and addresses of three adults who know you well. Dates of the Camp are August 14 to 27.

— A. A. —

RAMBLING AROUND NEW JERSEY

(Continued from Page 3)

being sent to the College at New Brunswick, where various tests are being made. Later in the season, tests will be made of potato foliage. This is an experiment designed to determine whether information can be collected so potato growers can be advised whether or not it will pay them to make a side dressing of fertilizer and, if so, when the application should be made.

I visited a number of farms in addition to those mentioned, and on every farm I found that *American Agriculturist* was a welcome visitor and that it was being read with pleasure and profit.

The United States uses enough coffee each year for every man, woman and child to drink 800 cups.

Mr. and Mrs. John McEnroe of Amenia, N. Y., members of Amenia Grange. Mrs. McEnroe, winner of the Dutchess County Grange Bread Contest, will compete in the bread contest finals this fall with 52 other county winners for the title of state bread-baking champion and a slew of valuable cash and merchandise prizes. This picture of the McEnroes was taken on their 25th wedding anniversary.

How to Splice a Hayrope

THERE is no great trick to splicing a rope—that is, if you know how. Better take a little time to practice up on splicing now.

There are two kinds of splices—the short splice and the long splice. The short splice is less neat, and bigger

FIGURE 1.

pulleys are necessary so the spliced part can pass through. However, the short splice takes less rope and that is important if your hay rope is short.

The Short Splice

Take a look at figure 1, which will show you how to start a short splice. The two broken ends are untwisted for six or eight turns. Then butt the two broken ends together, as shown in Figure 1, and tie a simple overhand knot in the corresponding strands from each rope. (See Fig. 2). As you hold the rope in front of you, each strand as it comes from the left is tied to the strand coming from the right which lies directly back of it. Fig. 2 shows you just how this is done.

Then the loose ends are woven back into the rope over one strand and under the next. To do this, you will need a pointed stick. You can make one easily from a broken fork handle or from any round piece of wood about that size. Make a long point on it, and use it to pry the strands apart so you

FIGURE 2.

can tuck the loose end through. Tuck the strands through in turn. Referring again to Fig. 2, first tuck A; then E; then C; and continue in rotation. Do not complete the weaving of one strand before you start another. Follow same procedure on the other side of the splice.

A short splice is just as strong as a long one, but it is more bulky. Fig. 3 shows how the short splice looks when it is completed.

The Long Splice

Here is how you make a long splice. It takes more rope, so the first operation is to unlay each end of the broken rope for ten or twelve turns. Put the two ropes together just as you did when you made the short splice (See Fig. 4). Then carefully unlay strand A, and carefully lay strand B in its

FIGURE 3.

place. As you do this, keep strand B twisted tightly. This is particularly important with an old rope which may be rather worn. Continue this until you have from 6" to 9" of strand B which is still unlayed. Then tie strands A and B with a simple overhand knot as you did when you made the short splice.

Now take a look at Fig. 5. Follow the same procedure with strands C and D, unlaying strand D and putting strand C in its place. Use care here that you do not unlay strand F instead of strand D. When strand D has been unlayed and C put in its place, these strands should be tied with an overhand knot as you did with A and B.

Do not unlay strands E or F, but tie them with a simple overhand knot just as they are. The splice is completed by weaving each of the loose ends over one strand and under the other. Before

FIGURE 4.

you do this, cut each long strand off to a length from 6" to 9", depending on the size of the rope. The bigger the rope, the longer the ends should be.

Whereas with a short splice the rope at the middle is six strands big, rope with the long splice will be only four strands big at any one point. You will

FIGURE 5.

need a little practice to make a splice but it is surprisingly easy if you follow directions closely.

Replacing a Broken Strand

Here is a good tip. Sometimes one strand of a rope will break. In this case, it is unnecessary to cut the other two strands and make an entire splice. Unlay the broken strand four or five turns in each direction. Take a strand of the same size and lay it into the place where the broken strand was unlayed. At each end, tie the strand you have unlayed to the one you have laid in with a simple overhand knot, and weave the four ends over and under just as you would in making your splice. (See Fig. 6.)

When rope is coiled up, uncoil it beginning with the end in the center of

FIGURE 6.

the coil, and have the coil on the floor so that the rope uncoils in the left-hand direction, opposite to the direction of the motion of the hands of a clock. If it uncoils in the wrong direction, turn the coil over and pull the end up through the center. A rope uncoiled in this way will not kink.

When you coil a piece of rope on the floor, coil it from left to right in the same direction as the hands of a clock. Do not coil a rope when damp, and when it is stored, keep it in a dry place.

Large pulleys cause less wear on ropes than small ones. The general rule is that the pulley diameter should be not less than eight times the diameter of the rope. In other words a 1" hay rope should be used with pulleys at least 8" in diameter.

BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

Our White Leghorns are making high records in 1950 laying tests. In 1948-49 official egg laying tests, our Leghorns won as follows: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Pennsylvania, Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird). We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks... own two hatcheries with 530,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

SHAWDER'S ANCONA FARM, RICHFIELD 10, PA.

They Treat Turkeys Like Hogs

FARMERS who try it find that it pays to treat turkeys like pigs—to turn them into a cornfield to let them "hog it down." The birds have sense enough to balance their own rations, so don't over-eat even when the corn's green.

The way it's done by Helmer and Alf Thygessen, brothers who each raise 5,000 turkeys a year near Cossayuna, N. Y., the self-harvesting of grain begins in August. That's when birds on grass range are allowed to wander into 15 acres of corn grown especially for them. At first, they eat only along the field edges, going after ears and lower leaves. This also allows them to get out of summer heat into shade. A month later, when they've stripped all the ears they can reach, a tractor helps them by knocking down two rows at a time.

The birds continue harvesting after frost, wandering back to the pasture's late growth for green stuff, and their hoppers supplied with pellets all through the season. By Thanksgiving time, they have left only a few tattered stalks in cornfields which look as if locusts had gone through them.

Under these free-choice feed conditions, the brothers figure their birds get 80% of their growth from purchased feed, the rest from foraging.

They first tried the method three years ago after learning how successful it had been at the 10,000-turkey farm of Arthur M. Goodnow, Brandon, Vt.

He plants 20 acres of corn for his flocks, and plans increasing to 40 acres—250 birds per acre. He figures costs at \$50 an acre for fitting, seeding and fertilizing the corn, which yields about 70 bushels of ear corn and

from 10 to 12 tons of forage—with the turkeys doing all the harvesting. One cultivation, two at most, is all that's necessary—weeds provide just that much more food.

Goodnow says 80 bags of feed daily for his birds drops to 75 when they go into corn. Even more important is the way they put on weight. It used to take nearly 80 pounds of bagged feed to get an 18-pound bird. "Now," says Goodnow, "we feed almost as much, but get a 22-pound turkey."

Another result is decreased cannibalism. Apparently, when the birds have corn to pick on, they pick on each other less.—William Gilman.

These turkeys on Alf Thygessen's farm, Cossayuna, N. Y., have done a clean job harvesting lower ears and leaves. A tractor will knock down the rest for them, two rows at a time.

Timely Poultry Notes

SMALL egg size and inferior quality usually noticed in summer eggs is believed due in part to a drop in feed consumption. Mash eating for the remainder of the year will be particularly hard to hold. In May, mash consumption should have equalled or exceeded grain, and for the remainder of the summer grain can be gradually cut and replaced with pellets. Many poultrymen are successful in substituting a pound of pellets for each pound of grain dropped from the allowance. A flock eating 32 to 34 pounds of feed a day to 100 birds on 60-75 per cent production should do well on 12 pounds of grain a day, all the mash they will eat and 5 to 8 pounds of pellets.

Red mites are likely to be troublesome unless carbolineum is used around the roosting spots, in the nests and on the walls up three or four feet. Spraying or painting, using the material pure, is the best known remedy. Poultrymen using no roosts often push the litter to one side, spray with pure carbolineum and move it back to the sprayed area. It is not safe to go through a season without spraying until the house has been treated several years. If the house was treated in the fall, there is no need to repeat now.

Lice, while not particularly harmful to birds, should not go unnoticed. "Black Leaf 40" painted on the roost or one of the newer products such as Benzene Hexachloride used in the same way is the best treatment. In roostless houses, laths or sections of snow fence can be put on the floor temporarily, painted as roosts would be and the birds driven in the area for a short time.

Chemical capons are gaining favor as poultrymen continue to get premium prices for "caponettes". They are not upset by the injection of the sex hormone as is the bird by caponizing. The

operation so upsets birds that many disease outbreaks follow caponizing. Injection of birds with the sex hormone pellet is so simple that anyone can do it. Cost of the pellets has been recently reduced. The best age is probably around 8 weeks, though it may have to be repeated if the birds are to be held for heavy weights. Only birds in the very best condition should be caponized in the old way.

Cannibalism and feather pulling seem on the increase in laying flocks this year. Some seem inclined to blame the so-called high efficiency rations carrying more corn. I'll reserve my opinion on the amount of cannibalism and the cause, and will offer these hints which seem to be the best we know to do:

Feed salt for a day or two—1 tablespoon to a gallon of water.

Feed more oats.

Trim the upper beaks with an electric debaker or knife.

Use one of the anti-picking devices.

Crowding is more troublesome than usual, report many poultrymen. On this I have little to offer. It's a vicious habit almost impossible to break up. Do you have a sure fire remedy? Let's have it.—G. T. Klein.

—A.A.—

A POLE POULTRY HOUSE

Don Hudson, Seneca County, N. Y., has sent in the following story in regard to a pole hen house which Howard Smith has just built. The cost of materials for this house was \$1.20 per hen or 30 cents a square foot of floor space.

The building is 30 feet wide and 60 feet long and provides space for 450 heavy birds.

The main structure consists of 6 posts on each side, 5 posts for the middle with poles running across the top. Twenty-two poles were spread

over this framework at regular intervals as rafters. Soft maple poles were used for rafters; white ash in the rest of the house. Bales of straw were used along the side and ends. The rafters project over the sides and ends of house at least three feet to protect the bales of straw. Ample drainage is provided to keep water away from the dirt floor around the building.

The following is the detailed bill of materials used with their cost:

104 sheets of 12 foot aluminum roofing together with nails for installation	\$345.00
Hardware and nails, approximately	5.00
Windows for front, approximately	80.00
Plastic glass for ends and rear	20.00
Cost of cutting trees, trucking them to the mill and sawing them into 2x4 for roof supports	32.00
Cost of wire to cover roosts, poles and windows	22.00
Cost of baling straw used in side wall and end construction	36.00
Total	\$540.00

The total construction time was 90 hours and was provided by Mr. Smith and his wife.

About the middle of last December when two-fifths of the house was furnished, a temporary partition was installed so that birds could be housed in that portion of the house while the remainder was being completed.

The litter used consisted of a layer of bean pods covered with wheat straw.

Mr. Smith says this building provides good shelter for the birds, and the ventilation is better than for more expensive houses.

Mr. Smith says that if he builds another house of this kind, he will use locust posts, gravel for the floor, and wide planks underneath the bales of straw to make them last longer.

—L. M. Hurd, Cornell Poultry Department.

CHICKEN OF TOMORROW

The Northeastern Regional Chicken-of-Tomorrow Contest will be held at Durham, N. H., on June 27. Richard Warren, extension poultryman of the University of New Hampshire, will be chairman.

Controls Coccidiosis at Low Cost

**DR. SALSBERY'S
Ren-O-Sal
Drinking Water Medicine**

**Stops Costly Chick Loss—
At About 1c Per Bird Treated.
Easy To Use**

Prevents spread of cecal coccidiosis. Give larger dosage at first signs (bloody droppings) of an outbreak. Has reduced chick losses for thousands of poultry raisers.

*G.S. Factor Benefits

Smaller doses provide *Growth Stimulation benefits. Tests prove quicker weight gains, earlier egg production and improved pigmentation and feathering. Use right from the start.

Buy tablets for drinking water or powder for feed, at hatchery, drug or feed store. Dr. Salsbury's Laboratories, Charles City, Iowa.

When you need poultry medicines, ask for

Dr. SALSBERY'S

City Rubes and Country Slickers

By W. B. LEWIS

TO the minds of some, there are two classes of people: city folks and country folks. Disregarding where they live, there is really but one class, for they all speak the same language, read the same papers, see the same pictures, hear the same radio programs.

The people in the cities are often alluded to as city slickers, while country people are referred to as rubes and hayseeds. I have spent thirty-five years among country people and thirty-five years in the cities, twenty of those years in New York. There are more rubes per thousand people in New York City than among the same number of country people, only the city rubes are dumber. In the rural sections, there are some pretty slick slickers, too. Maybe because the air in the country is purer, the country slicker seems to smell worse!

Chasing Rainbows

Statistics show that three-quarters of our population used to live on farms. The 1948 figure shows that nowadays only one out of seven persons live on farms, providing our nation with food and helping to feed other countries. That's a big drop in ratio—from seventy-five out of every hundred to fourteen of every hundred. The difference shows how many rural folks have been deluded into going to the city and paying high prices for food, meanwhile breaking their backs to make someone else rich while they die poor themselves, when they could have lived in the country, raised their own food, and died well off, if not too lazy. Any day, I'll take the affirmative side of a debate that the farmer has far the best of it.

This morning it started to rain about seven o'clock. The storm was beautiful in its coming. Every farmer in the area knew by a hundred signs that it was brewing, and watched the dazzling display of zigzag chain lightning in a great sector of the firmament as they went about their barn chores and ate breakfast—warm, dry and well fed. You have all seen so many of those morning storms—decisive while they last but clearing up around nine or ten o'clock.

My mind went back to city people going to work at those same hours. They had to get out in it from 30 to 60 minutes on their way to work. They looked for rubbers and raincoat, and then remembered they were down at the office since the last rain, and so they went forth and got wet feet in gutters of running water as they fought for buses or subways or paid a dollar for a taxi—if they could find the taxi. The farmer does not have to go through all that. When he wakes on such a morning, he steps into dry, felt-lined rubber boots and is on the job. He and his men have a number of rainy day jobs, or maybe build the kitchen cupboard mother has been asking for.

Two Breakfasts

Last Wednesday morning I was in a home to which I had been called before daylight, and I had breakfast there. At the farm table were two sons, younger than the two daughters who were 21 and 22½. The younger girl had finished her studies at the State University, and the elder was a Vassar graduate. Both wore heavy slacks and shoes. Their windbreakers, caps and gloves lay on a chair. The older girl was going to run a tractor and plow, and the younger one was telling her brothers she wanted

more weight on the roller which she was about to operate with her tractor on a 20-acre meadow. I watched those girls eat—wheat cakes, a slice of ham, a plate of home fried potatoes, a dish of peaches, and two cups of coffee each. Both will be married in June to two boys a mile up the road, agricultural college boys who at nineteen started a produce and poultry farm.

In direct contrast (and I think you will agree it is a fair comparison), three years ago in order to gather certain information on breakfasts—which they tell us should be our best meal—I had the job of checking a drug store on Lexington Avenue in New York City from 8:00 to 8:30 a.m. when office girls were getting their breakfasts.

I checked seventeen girls in the half hour. All worked in neighborhood places, all were very well dressed, except for their feet. I was seated where I could see just what the soda fountain boys gave them. Two had Seidlitz powders; one of them tasted her orange juice and had three swallows of coffee. Another took half of her orange juice and half her coffee and two bites of toast. Two others took an aspirin; neither of them drank her orange juice, outside of a sip or two, and each tasted her coffee.

The rest of the seventeen girls finished their toast, coffee and orange juice, and one had wheatcakes in addition. Eight lit cigarettes. Now for their feet. It was 33° outside, and half an inch of slush on the walks. Four of the girls wore substantial rubbers; six wore good shoes; seven had open-toed shoes and cold, wet feet which the manager of the store said they would partly dry on the radiator in the ladies' room where they worked, if they had time, and, he added, "sniffles or worse tomorrow."

Who Are The Rubes?

So, with that scene in mind, when I saw Loretta and Grace eat last Wednesday morning I asked myself: "Who are the rubes?" These two, husky farm girls, who didn't need aspirin or Seidlitz powders, could probably mop up the floor with the seventeen city girls in a fair fight. They ate three real meals a day, and didn't have to worry about weight—the tractors took that off and made them tough.

I haven't picked a special farm. There are thousands of such farm layouts in this country. I have not chosen a special drugstore breakfast—there are thousands of such drug-store breakfasts every morning. Loretta and Grace probably possessed more combined education than the seventeen city girls I have described. The two farm girls are not worrying about losing their jobs or about promotions. I noticed at the farm a family car, and in the shed were two lighter "runabout" cars, all good. I'll wager none of the seventeen girls ever owned a car, though they have probably paid enough in taxi and subway fares to own one.

Well, maybe there is a difference after all between city and country people—in favor of farm people by far, who dress to meet the weather, can take a day off to attend the fair or go fishing without getting their pay docked; who eat three low-cost, high-class meals every day and don't have to leave a tip.

—A.A.—

A serving of beet greens will contribute about one-third of the vitamin A a person needs for a day.

SUNNYBROOK

Baby Chick Prices

Reduced!!

Because of the late season, we have lowered our baby chick prices. You will be amazed at the new low price for these highest quality chicks. We have them in all the popular breeds. They will be selling fast at this new low price, so you better wire or phone or write us today.

STARTED PULLETS

Our prices on Started Pullets are lower than it would cost you to raise them. You see, we have skilled labor and the best of equipment. Then too, our feed costs are lower because we buy by the carload. We have them in all the popular breeds, 4-6-8-12-16 weeks old up to ready-to-lay. We can make immediate shipment.

CAPONS

Our 4 week old Capons cost less than day old turkey poults. They are past the danger point for losses and bring highest premium poultry prices. Many turkey growers are now going into Capons. They are money makers. Let us tell you more about them. Write us today.

From U.S. Approved Pullorum Clean Breeders—of Course.

Wherever you live—you are a neighbor of Sunnybrook. By Parcel Post, Railway Express, by Air or by our own fleet of trucks, we get them to you safe and sound 100% alive, we guarantee.

WANTED old, horse-drawn peddler's wagon, with shelves, and drawers in superstructure and drop-leaf sides. Must be in useable condition. State price. Colin B. Keillor, Wading River, Long Island, New York.

MEN'S assorted hose, slightly imperfect, 6 pairs \$1.00. Ball Point Pen free with order. Economy Hosiery Company, Ashboro, N. C.

By J. F. ("Doc") ROBERTS

THE PROBLEM of knowing what to raise and what to do on our Northeast farms seems to become more difficult every year. But it also seems that every time Washington passes a farm bill, or labor goes on another strike, it becomes more apparent that we must grow what we use and depend less upon transportation, labor, and undependable laws, rules, restrictions and promises.

Fortunately, our Northeast farms can do just that with our God-given grasses, more livestock, more fences, and more homegrown grains.

Here are a few examples of our changing livestock conditions:

Dairy cows are high, and every dairyman has a tremendous investment in them. Obviously, replacements are also high if we go out to buy them; yet we must do everything possible to protect the value of our herds and our milk production. Just the minute replacement cows or heifers are put on wheels, whether from Wisconsin, Canada, or the nearest market, then costs mount up so fast that they are all out of proportion to the miles covered or the value of the animal.

Grow Your Own

Right now the increased land set aside to raise and mature each farm's own replacements has proved to be the highest paying acres on the farm. This will continue to be true with the use of our own grasses, silages, small grains and corn, none of which can be transported any more at a cost that can compete with our home farms. Perhaps you heard about the man in Iowa who bought second cutting alfalfa at \$7 a ton and sold it to a man in New Jersey for \$40 a ton, and who thought he was getting rich until he found out that it was costing him \$51 a ton to deliver it in New Jersey.

Furthermore, as these handling charges go up and up, our competition from the mid-West becomes less and less. As this trend continues, food for the East must be produced in the East, which in turn places the responsibility for surpluses, markets, and prices squarely on eastern farmers and their organizations. National laws and government controls will bring more headaches, will be more harmful, and more unnecessary.

Profitable Sheep

For many years lambs have been brought into western New York from the western ranges, fed and fattened in the winter and sold in the spring. Gradually costs of transportation for the lambs themselves and grain to feed them have increased until lamb feeding has become highly speculative and profits have become smaller in relation to outlay and expense. This leaves the field wide open for the return of ewe flocks into the Northeast; for example, 100 ewes should produce 100 lambs averaging 80 pounds on grass. At prices of the last few years (better than 20 cents a pound, and there is no reason to believe they will bring less for a number of years), the income to the Northeast farmer would be far greater with less investment and with almost no purchased grain than in feeding a load of western lambs. The wool alone from such a flock should pay their keep every year. Watch ewe and lamb flocks come back into the Northeast! My recent ad in AMERICAN AGRICULTURIST about yearling ewes brought more inquiries than there were ewes.

Beef cattle are facing exactly the

same situation. Any cattle operation that can use our grass, our silage, and our home-grown grain to mature and gain in weight is sound economy today in the Northeast, and has been for a number of years. But when we go out to compete with the mid-West on corn-fed and fattened cattle, we are just out of order.

Yes, our livestock and grasses are coming into their own. Population is increasing and improved diets of meat, eggs, milk and greens are rapidly replacing grains as food. Our geographical location and our natural grasses with our moisture all go together, and all are receiving the serious consideration they deserve.

We are beginning to utilize and improve acres which were going into surplus crops or which were being abandoned. The day of the abandoned farm of the Northeast should be over.

HEREFORD SALE

At the New York Hereford Breeders Association Show and Sale at Cornell University, May 6, the average price paid by buyers was \$598. Thirty-eight females averaged \$614; seven bulls averaged \$509. Top price of \$1,250 was paid by J. D. McKinnon of Elmira for Lady Rupert, consigned by Harry Bridger of Oak Point Farm, North Rose, New York.

— A. A. —

EMPIRE TO OPEN NEW MARKET

The Empire Livestock Marketing Cooperative, with headquarters at Ithaca, New York, has leased the H. H. Thomas Sale and Exchange Stables at Malone, New York. They will open a market there which will be the 7th in the State. The first market opened at Argyle, New York, in 1947.

The market is being remodeled and scales are being installed for weighing livestock. As soon as remodeling is completed, Empire will take over the operation. At least for the present, Friday will be continued as sale day.

E. Frank Sweet, who has been manager of the stockyards at Greene, New York, has been named manager at Malone, and William Thompson, former assistant at Caledonia, will become manager at Greene.

— A. A. —

OVERWEIGHT TRUCKS

A new law in New York State provides that Officers may stop trucks which look overweight and insist upon immediate weighing at any scale within three miles. The New York State law calls for tractor-trailers to weigh not over 30,000 pounds plus 750 pounds per foot for every foot between the first and last axle.

FOR QUALITY MILK USE

KLEEN-EZEY THE QUALITY CLEANER - SANITIZER IT HAS —

- high bacteria kill (including thermodurics) within one minute in water of any hardness.
- quick, thorough cleansing
- deodorizing that eliminates objectionable odors—doesn't merely hide them.

... and all three—sanitizing, cleaning, deodorizing — are performed in one operation. KLEEN-EZEY saves you time, labor and money.

"I do prefer KLEEN-EZEY to most cleaners."

A Quart a Day

By GRACE WATKINS HUCKETT

D ID YOU ever stop to think what a different world this would be without the cow in it? If you have run out of milk just when you wanted to make a custard or a cake or give the family a creamed dish, or prepare the baby's formula, you know what a great loss

it would be never to have any milk—not to mention golden butter, tasty cheese, delicious ice cream, and pure cold milk to drink.

Besides the good eating we get from dairy products, there's the contributions they make to good health, virility and fine physique. They're our best source of calcium, necessary for strong bones and teeth. Phosphorus, another essential mineral needed by every cell in the body, is found in milk; also, vitamins A, B, C, D, and riboflavin. The protein in milk is easily digested and completely used in building and repairing muscles and body tissues.

We have always known that milk was good for children, but recently there has been added stress on the need for milk in the diets of adults, especially those past middle life. Research by Dr. Clive McCay at Cornell University has shown that milk is especially useful during the later years because it requires no cooking or chewing and provides the protein and calcium needed in old age.

If someone in your family doesn't like milk and won't drink it, then you will need to serve more milk dishes in order to provide the required quart a day for each child and the minimum requirement of a pint for each adult. A quart for each adult is better. Besides the usual ways to use milk in the diet—cream soups, custards, sauces, puddings, cheese dishes, creamed vegetables, ice cream—milk can be used instead of water to cook cereals and to make breads, pastries and gravies. The following recipes use milk liberally:

BAKED HAM AND RICE

1 slice ham, 1½-inches thick (about 2¼ pounds)
1½ cups rice
1 quart milk
Paprika or curry (if desired)

Trim off most of the ham fat; cut ham in 6 serving pieces and brown lightly in a hot frying pan. Place half the rice in a baking-dish, cover with the ham and sprinkle remaining rice over the top. Pour a little of the milk into the pan in which the ham was cooked, stir well and pour into the baking dish. Add remaining milk; bake in a moderate oven (350 degrees F.) for about an hour or until meat is tender and rice is soft.

If curry flavor is desired, blend ¾ teaspoon curry powder into fat in frying pan before adding milk; if paprika is liked, dust top of dish lightly immediately upon removing from oven. Serves 6.

SHRIMP CURRY AU GRATIN

¼ cup butter
½ cup finely diced onion
½ cup diced celery
1½ tablespoons flour
1½ teaspoons salt
1 teaspoon curry powder
½ teaspoon ginger

1 teaspoon sugar
3 cups milk, scalded
1½ pounds shrimp, cooked and cleaned
3 tablespoons lemon juice
1 cup grated cheese
4 cups boiled rice

Melt butter, add onions and celery and cook until tender, while stirring. Blend in flour, salt, curry powder, ginger and sugar. Gradually add hot milk, while stirring; cook until thickened, stirring constantly. Add shrimp, lemon juice and half of the cheese; heat through. Turn into individual cas-

seroles containing rice and sprinkle with remaining grated cheese. Broil to melt cheese. Serves 6.

FISH BAKED IN MILK

2 pounds fish
1 egg, well beaten
½ cup dry bread crumbs
1 teaspoon salt
1 cup milk
2 tablespoons butter

Open up the fish lengthwise to permit its being placed flat in the baking dish (or fish fillets may be used), but do not cut through the skin. Spread the cut side with egg and sprinkle with crumbs and salt. Place the fish, cut side down, in a well-buttered casserole or baking pan. Pour the milk over the fish and dot with butter. Cover and bake in a moderately hot oven (400 degrees F.). Serves 4.

CARROT RING

2 cups grated raw carrot
1 tablespoon grated onion
2 tablespoons butter
6 tablespoons flour
2 cups milk
1 teaspoon salt
2 eggs, beaten separately

Melt two tablespoons butter in a saucepan. Add grated carrots and onion, cover and cook over low heat for 5 minutes. Melt 6 tablespoons butter, add flour and salt; blend well, add milk and cook until thick, stirring

small platter and carefully remove waxed paper. Cut into slices or squares to serve. Garnish with whipped cream. Serves 8.

COTTAGE CHEESE SALAD DRESSING

1 cup cottage cheese
1 egg yolk
½ cup salad oil
1 teaspoon mustard
½ teaspoon salt
2 tablespoons vinegar or lemon juice
Paprika

Add beaten egg yolk to the cheese and mix well. Add oil and seasonings and beat thoroughly. Makes a dressing somewhat like a stiff mayonnaise. Makes 1½ cups.

STRAWBERRY CEREAL PUDDING

¼ cup farina
2 cups milk
½ teaspoon salt
¼ cup sugar
2 eggs, separated
1 cup sliced strawberries, slightly crushed
2 tablespoons sugar

Blend farina with ½ cup cold milk. Scald remaining 1½ cups milk; gradually add blended farina while stirring. Add salt and ¼ cup sugar and cook over hot water until smooth and thickened, 5 to 7 minutes. Add a little hot mixture to beaten egg yolks and blend; return to remainder and cook 2 minutes longer. Remove from heat; cool covered. Beat egg whites until stiff.

Delicious Strawberry Cereal Pudding makes a colorful, refreshing, thrifty summer dessert.

— Photo Courtesy of General Institute, Inc.

constantly. Add beaten egg yolks, return to fire, bring to boil and stir well. Then add grated carrots and fold in beaten egg whites. Pour into a buttered ring mold, either individual or family size. Place in pan of water 1 inch deep and bake until firm in moderate oven (325 degrees F.) for 30-45 minutes, depending upon size of mold. Loosen edges and turn carefully onto hot platter. Fill center with hot cooked peas. Serves 6.

MOCHA REFRIGERATOR CAKE

2 squares unsweetened chocolate
1½ cups (15-oz. can) sweetened condensed milk
½ cup strong coffee
½ cup nutmeats, finely chopped
24 vanilla wafers

Melt chocolate in top of double boiler. Add condensed milk and stir over rapidly boiling water 5 minutes or until mixture thickens. Add coffee and nuts, blending thoroughly. Let cool. Line narrow, oblong pan with waxed paper. Cover with layer of chocolate mixture. Add layer of vanilla wafers; continue alternating this way until chocolate mixture is used; finish with vanilla wafers. Chill in refrigerator 12 hours or longer. To serve, turn out on

Add 2 tablespoons sugar to egg whites, beating between each addition. Fold pudding mixture into egg whites and chill. Fold strawberries, sweetened with sugar, into pudding just before serving. Garnish with whole berries. Serve with plain or whipped cream. Serves 6.

NUT BREAD

2 cups all-purpose flour
2 teaspoons baking powder
1 teaspoon salt
½ cup sugar
½ teaspoon soda
¾ cup finely chopped nuts
1 tablespoon butter
1 egg
1 cup buttermilk

Mix and sift flour, baking powder, salt, sugar and soda and stir in the nuts. Add melted butter to slightly beaten egg, add buttermilk and stir into dry ingredients. Mix just enough to moisten. Pour into buttered loaf pan (about 4x9 inches) and bake in moderate oven (325 degrees F.) for 40 to 50 minutes. Makes 1 loaf.

WHIP CREAM COOKIES

1 cup whipping cream
1 cup sugar
2 eggs, beaten
3 cups flour
3 teaspoons baking powder
½ teaspoon salt
½ teaspoon nutmeg

Whip cream, add sugar gradually, then beaten eggs and sifted dry ingre-

dients. Mix well and chill. Toss on a floured board, pat and roll ¼ inch thick. Cut with small round cutter dipped in flour. Bake on greased cookie sheet in moderate oven (350 degrees F.) 10 to 15 minutes. Makes 3 dozen cookies.

LEMON-ORANGE SHERBET

½ cup strained lemon juice
½ cup strained orange juice
¾ teaspoon grated lemon rind
½ teaspoon grated orange rind
1¼ cups sugar
3 cups sweet milk

Add grated rinds and sugar to mixed juices and milk; stir until sugar is dissolved. Pour mixture into 2-quart freezer and freeze at once; when mixture is frozen, pack in ice and salt and let stand for 2 to 3 hours. Approximate yield, 1 quart.

RASPBERRY MILK

2 cups red raspberries
½ to ½ cup sugar
Few grains salt
6 cups milk
½ to ¾ teaspoon lemon juice
Whipped cream

Crush chilled berries, stir in the sugar and salt and add to the milk. Add lemon juice and, if desired, press through a sieve. Pour into glasses and top with whipped cream. 6 servings.

PEPPERMINT FLIP

¼ cups milk
1 to 1½ cups FINELY crushed red and white hard peppermint candy
½ cup whipping cream
¼ cup COARSELY crushed peppermint candy

Scald milk in double boiler; add finely crushed candy and stir until dissolved. Chill and pour into glasses. Top with whipped cream and sprinkle with the coarsely crushed candy. 6 servings.

GINGER COOLER

1 cup milk, chilled
Pinch salt
½ cup gingerale
2 to 3 tablespoons vanilla ice cream

Pour in a tall, chilled glass. Add salt and stir in gingerale. Top with ice cream and serve immediately. Makes 1 tall glass.

STRAWBERRY CREAM PIE

1 cup sugar
¾ cup flour
1 teaspoon salt
3 cups milk, scalded
2 eggs
2 tablespoons butter
1 teaspoon lemon extract

Mix the sugar, flour and salt in a bowl; stir in the scalded milk and return to the top of the double boiler. Stir over boiling water until the mixture has thickened. Cover and let cook while beating the eggs. Stir a little of the hot milk mixture into the eggs and beat well. Return to double boiler and cook one minute. Add butter and extract. Line a baked pie shell with strawberries or other fresh fruit and pour on filling. When cool, top with whipped cream and serve.

JUNE WATERCOLOR

By Eleanor Alletta Chaffee

Ankle-deep in buttercups
He runs, and on his knees
June's golden dust is clinging;
The chorus of the bees
Lies like a spell. O moment
Of freedom and delight,
Let me set you in my heart
Against a coming night
When frost will take the meadow
And years will take the boy.
I heard you in my treasure chest
Of beauty and of joy.

SAFEWAY answers
the question:

How much of the Food Dollar goes for SELLING?

When discussing the costs of food distribution, people sometimes assume that the whole of such costs, or a major part of them, are run up by retailing.

Charts which show the farmer's share of the food dollar spent by customers as 50¢—and label the other 50¢ as “distribution”—do not make it plain that retailing is just one of many costs paid out of the food dollar.

This 50¢ total cost called distribution also includes charges for storage and freight, for grading, cleaning, processing, packing and wholesaling.

Further, this 50¢ is an average for all farm crops. Actually the farmer's share varies widely between different crops, depending on the amount of processing and other services required. But on the basis of this “average” food dollar, let's look at Safeway costs...

Q What part of the food dollar is spent by Safeway to do the retailer job?

A Less than 14¢. Yes, to cover all our costs from the time we put farmers' products in our stores until we sell them to customers, it takes less than 14¢ out of every dollar spent in our stores. This 14¢ pays our day-to-day retail costs—such costs as wages, rents, taxes, displaying food attractively, and inviting the public with advertising to come and buy. This 14¢ also includes a profit for Safeway.

Q How much profit does Safeway earn?

A Safeway's profit in 1949 was 1⅓¢ per dollar of food sales at our stores. All our costs of doing a retail business, plus a profit, total less than 14¢.

Q Is this 14¢ out of each dollar of Safeway sales smaller than the average costs for these same functions?

A Yes, 14¢ is a considerably smaller than average retailing cost, because Safeway

handles and sells more food per store and per employee. Safeway's system is one of low cost distribution of food. The efficiency of this system allows Safeway to return to farmers both *more total dollars* and a *larger share of each food dollar*.

Q Is this 14¢ per dollar of sales more—or less—than Safeway has operated for in the past?

A Less. The part of the food dollar for which Safeway performs its services is lower now than it was 10 years ago. Of course, the dollar volume of our sales is larger now, due in part to increased food

prices. But our labor and other costs have climbed even more sharply, requiring us to seek constantly new ways to operate more efficiently. With total population and per capita food consumption both larger than in 1940... we can do our job today for a smaller share of more dollars from more customers.

• • •
The Safeway idea of selling more food per store and per employee isn't ours alone. We are in free competition with many stores working toward the same end.

It seems to us that is good for everybody—for farmer, customer and store man alike. We invite you to test our ideas of how a store should be run by doing your food shopping at Safeway, where almost one-fifth of all customers are farm families.

Today in Aunt Janet's Garden

Plan to Water!

MY ORIGINAL fears for my chrysanthemums were justified, sad to relate. With only one or two exceptions have I ever known a more disastrous winter as far as perennials are concerned. Chrysanthemums especially suffered—not only mine, but those of friends all over the Northeast.

The fine hybrids fared worst. Common seedlings look fine! I have never made a point of buying chrysanthemums bred to resist cold. I may think twice now before I get any other kind. Those of the Chicago strain have been bred in the Middle West for winter hardiness, but I didn't happen to have one of them in my garden and therefore don't know whether even they would have come through safely.

Daffodils which I had grown for over ten years failed to show up this spring. The pink one, Mrs. Backhouse, disappeared completely. Some of the fall-planted daffodils either didn't bloom or bloomed on very short stems. Late planting and the very dry season account for this—not to mention the late spring!

From time to time readers have asked why their old-fashioned late double white daffodils blast and refuse to open. This usually results from too much heat or too little water. If the sheath covering the blossoms dries out from either cause, then the flower cannot expand. A newer double white, Daphne, is not so apt to blast as the older form. Just now one is showing off to perfection in my rock garden.

This summer will show up the effects of last year's prolonged drought. Many branches of shrubs will not leaf out and will be dead at the tips. If the summer proves to be another dry one, it will take watering and plenty of it to prevent even more serious damage. April rainfall was 2 inches short of normal and that has to be made up if plants are to thrive.

Best Cherries for Freezing

ALTHOUGH most people freeze cherries from the trees they happen to have, choice firm-fleshed sweet cherries make the best frozen product. Dr. Frank A. Lee of the New York State Experiment Station has made tests which show that soft sweet cherries are likely to be soggy after freezing, but those with firm flesh give attractive results.

Dr. Lee reports as best for freezing Schmidt, Lambert, and Bing cherries—all grown in New York State. Also he rates Victor and Napoleon (Royal Ann) as "quite satisfactory."

To prepare cherries for freezing they are stemmed and washed, drained, put into cartons, and covered with a sirup of sugar and water of the desired strength. This sirup is usually made of equal parts sugar and water unless you happen to prefer a less sweet product. I have eaten white oxheart cherries which were frozen just as they came from the tree with pit and stem still intact—all washed of course! These were put into cartons without sirup or sugar, and when partially defrosted

were used for topping for fruit cups. They could be eaten out of the hand like fresh fruit, but of course would not be good for dessert purposes.

Dr. Lee recommends adding ascorbic acid powder (Vitamin C) to the sirup. For this purpose it could be purchased at the drug stores and weighed accurately there, allowing for eight pints of packed cherries, 1.6 grams of the powder. He dissolves this amount in 1/8 measuring cup of water before mixing into the sirup. By this time we are all familiar with the fact that ascorbic acid powder helps to prevent darkening of certain fruits; besides this it aids nutritionally.

As with other products, freezing too many sweet cherries at once does not give best results. Twenty to twenty-five pints in a 20 cubic foot freezer at a time is about the limit, Dr. Lee says. For fast freezing these should be arranged with air spaces between boxes and one side of each box against the bottom or side wall of the cabinet. Allow ten to twelve hours for freezing. After the cherries are frozen, then the boxes can be packed tightly together for storage in the freezer.

TIPS FOR BUYING SHIRTS

DO YOU hate to buy shirts for hubby? Is it one of those "must" jobs that fill you with dread? Don't be dismayed; a good many women are like that. So perhaps a few tips or pointers in buying shirts will help you the next time you have to go to market for the men folks of your family.

Of course, you know shirts are sized by the collar, measured from center of the button-hole in each side of the band, and the sleeve length. A shirt marked 15-3 means a size 15 neckband with a 33-inch sleeve.

My husband has short arms so I have to be very careful and get the correct sleeve length for him. On the other hand my brother has long arms and his shirts must be purchased with an eye to a long sleeve or else the cuff will hit him halfway between the wrist and elbow.

Sleeves should have well placed fullness at the cuff and a long enough placket to spread the cuff out flat when ironing it.

The style of the collar has a lot to do with comfort. A man with a short, stocky neck will not be comfortable in a high stiff collar, and a man with a long, thin neck will be sure to expose his Adam's apple in a low-type collar.

The yoke should fit at the shoulders and the fullness be taken in evenly. Collar and center pleat should be perfectly tailored.

You can judge a well made shirt by the buttons. They should be smooth and even on the wrong side as well as the right, and firmly sewed on. Good buttons are usually found on good quality shirts.

Last but not least note the fabric of which the shirt is made. It should be close weave, firm, with threads that do not easily separate. It is wisest to buy a shirt that carries the manufacturer's guarantee that it is fast color and pre-shrunk.

Of course, here is the best tip of all: Let your husband buy his own shirts!

MAKE A RAINY DAY SCRAPBOOK

THE NEXT time the children are kept indoors on account of the weather, get them interested in making a "zoo" scrapbook. This will take only a small amount of your time and keep them busily occupied for hours.

Most all boys and girls love animals and, whenever possible, they should be taken to visit the zoo. Often, however, you live where this is an impossibility, but you can bring the zoo to the chil-

I LIKE LAWNS

By Inez George Gridley

I like embroidered dandelions on a pale green lawn Where robins strut and look for worms on a chilly dawn.

And October lawns all polka dots of red and yellow leaves In patterns that the gusty wind disturbs and interweaves.

Or neglected lawns with plantain spires and shaggy Queen Anne's lace, Thrown cozily across the knees of some old and rambling place.

dren by helping them create animal scrapbooks.

Let the children cut all the different kinds of animals they can find from old discarded books and magazines. Of course, this should include pictures of fish and birds, too.

When each child has collected enough pictures, he can then commence to paste them in his scrapbook. After he has pasted an animal in the book, show him how to letter its name neatly underneath. Leave plenty of space between each kind so that stories about the animals may be added. This information can be gathered at home, if available; if not, let your child look it up at the school or public library. He will want to tell about their home, their habits or any other information that may be interesting. In this way he not only learns the different kinds of animals, fish, and birds, but he learns something about each kind.

A "Zoo scrapbook" keeps the children busy and happy on a rainy or stormy day and greatly enlarges their store of knowledge.—B. C.

After five High School girl cheerleaders generously sprinkled the block in front of Ithaca, N. Y.'s City Hall with "Cheer," Proctor and Gamble's new detergent, firemen hosed the pavement, the street foamed with suds, and prominent citizens grabbed brushes and started scrubbing to oblige the cameraman. Incidentally, a free box of "Cheer" has been sent by its maker to every farm family in New York State, where the product is being introduced this spring.

Spring Cleaning Comes to Ithaca, N. Y.

A STREET full of suds, with everyone including Mayor Stanley Shaw lending a hand in the scrubbing, recently climaxed a six weeks' clean-up campaign in Ithaca, N. Y., sparked by WHCU, the Cornell University radio station. During the campaign, citizens were stimulated by daily broadcasts and \$600 in cash prizes, provided by WHCU, to clean up and fix up their homes and their town.

First prize of \$100 in the home renovation class went to Mrs. Harold J. Connor for complete renovation of her kitchen and bathroom. In the group class, a \$75 first prize was won by 250 Boynton Junior High School students who really went to town and polished up everything in their school from their desks to the handle on the big front door. Another first prize of \$25 in a class for children went to 4th graders at the Belle Sherman school for cleaning up and planting a little park-playground in their neighborhood.

Thirty-five merchants and industries cooperated, advertising home aids all down the line. Officials from City Hall, professors from the "Hill," health officers, nurserymen—anyone who could give a word of advice or encouragement was brought to the mike by WHCU. The County Health Commissioner pointed out health hazards from neglected garbage, and the Fire Chief stressed fire hazards from rubbish piles, faulty electrical equipment and other invitations to disaster.

Citizens were asked by WHCU to send in their suggestions for city improvement, and also their complaints. When demands for soot control, for care of neglected vacant lots and houses, and for park tidiness rolled in, WHCU aired the gripes and stirred authorities to do something about them. Boy Scout Troop 18 cleaned up the Tompkins County War Memorial in DeWitt Park, and the city painted benches and flagpole—but the question of planting grass seed in the bare spots made by ball-playing youngsters was decided in favor of the kids.

Extra men and trucks were detailed by the city to cart away junk during the last week of the campaign, and it turned out to be the greatest collection since the war years. The Kiwanis Club asked for usable discarded articles, held a White Elephant Sale, and

collected \$177 for its Youth Service Fund.

It was a great spring cleaning, and Ithaca, N. Y., is feeling much cleaner and brighter, as are thousands of other communities throughout the country that have held a clean-up campaign this spring.—*Mabel Hebel.*

—A.A.—

STALLING AT BEDTIME

One wise mother I know has hit upon a plan that gets the children off to bed promptly—and peacefully.

It is natural for children to try to stall off going to bed, for they are always eager for just a few more minutes of play. This mother told me that she had no more trouble of this kind since she made a "promptness rule." Every child is warned ten minutes before time to go to bed, and for every minute he is late a penny is subtracted from his allowance.

The mother realizes that this is a strict rule, but through it her children are learning that there is a penalty for not being prompt.—*B. C.*

No. 2144. What could be more versatile than the cap sleeve dress featuring a trim fitted bolero for the costume look? Sizes 12-20; 36-46. Size 18, 6 yds. 35-in. for the dress and bolero.

No. 2114. Whether made strictly tailored or touched with eyelet, this slimming side-panel shirtwaist dress is smart all day long! Sizes 12-20; 36-46. Size 18, 4 7/8 yds. 35-in., and 2 1/2 yds. eyelet.

"I can always depend on Fleischmann's for prize-winning results," says prize cook Mrs. MacLaughlin.

West Warwick Cook is Grange Contest Winner

Her family rejoices with prize cook Mrs. Anna G. MacLaughlin (center) over the award she won at a recent Grange contest. Both Mrs. MacLaughlin and her husband are officers in the Kent County Pomona Grange #3, and Mrs. MacLaughlin has been entering and winning Grange Contests for many years. "It takes more than experience to be a prize-winning cook," says Mrs. MacLaughlin. "It takes the best

ingredients, too. When I bake at home, for instance, I make sure I use a good, lively yeast like Fleischmann's. It's so fast rising and I can always depend on it for prize-winning results!"

It's true! Fleischmann's Yeast is made extra active to rise extra fast—to give you perfect results every time. No wonder America's prize-winning cooks prefer Fleischmann's Yeast to all others.

Two-Way Wonders

THE YOUTH'S COMPANION

Uncle Jack's Idea

AUTHOR UNKNOWN

FOREWORD

In this amusing story taken from the YOUTH'S COMPANION of February 1888, "Barbara Fury," a cantankerous old maid, meets her match in Uncle Jack.

UNCLE Jack Dalrymple was the best natured soul in the parish. His home was a trim little house at the end of the village, the front of which in summer time, with its two windows above the door and narrow porch beneath, and the vines overhanging the roof, looked not unlike the face of an old woman in a green bonnet.

Here the flowers bloomed, bees hummed, and Dame Nature, as if pleased with her surroundings, seemed to do her best.

Uncle Jack's vegetables, pigs, and chickens thrived, and nothing came to mar his enjoyment until the sad day when his sister Debby, who for many years had been his housekeeper, was laid under the turf in the church-yard.

For two months Uncle Jack lived alone; but, one evening, after thoughtfully smoking his pipe, he jumped up with the sudden exclamation, "I've got an idee!" Having performed an extra ablution, he donned a clean shirt, combed the thin side locks over the bald place on top of his head, put on his Sunday coat and hat, locked the kitchen door, and started for the other side of the village.

Here had lived Dr. Bell, an old physician who had now retired from practice and moved to the city. With him had lived for several years, as housekeeper, Barbara Fluery, who, on account of a certain infirmity of temper, had been nick-named "Barbara Fury," and the name had fitted her so well that many persons who knew her were not aware that it was not her real name. With the exception of this one fault, she was a model in looks, neatness, and industry, and was also a most excellent cook.

Barbara, who had come to look upon the doctor's house as her home, sat wondering with many misgivings on this particular evening what sort of life she would be likely to lead in the next town at her sister's house, where the rooms and accommodations were small and the children numerous. Hearing a rap, she opened the door and found Uncle Jack.

"Good evening, Miss Fury."

"My name is Fleury," she responded, in icy tones.

"Why, so it is," said Uncle Jack, rather shaken, but smiling blandly. "It's quite a nice evening, this evening, Miss Fleury."

"It will do," she said coldly, standing to hear his business, and not inviting him to sit down.

"I was feelin'," he said, with a little hesitation, "sort of lonely, and thinkin' you might be feelin' the same I thought maybe you'd think it no harm for me to offer you a little of my company."

The possibilities of the situation struck Miss Barbara at once, and its superiority to anything else that was likely to offer was equally clear, and in a moment she had decided in the affirmative.

"Take a chair and sit down," she

BOSTON, THURSDAY, FEBRUARY 9, 1888

said, in a tone greatly mollified.

"I don't care if I do," replied Uncle Jack. "The truth is, Barbara," he said, bolting into the subject which he had previously thought might take him an hour or two to arrive at, "I was thinkin' if you was willin', we might as well join hearts and hands, and let one roof cover us. I've a comfortable home as you know, I've a pen full of as pretty pigs as you'd see in a day's ride, I've been lucky with my chickens—"

"And I reckon they scratch and make more dirt than pays for their keepin'," she said.

"Well, if you come and take charge, you can do as you like with them. Sister Debby always got the chicken money, and I reckon I'll not be less generous to my wife, ha! ha! ha!"

"I'm able to keep myself, and need be no man's wife to get a livin', even if I never do another stroke of work," she said tartly.

"Of course, of course," said Uncle Jack. "I meant no reflections, but if I take a wife I keep and pay for her, and if she has money of her own, she can bury it in a vault, give it to the heathen, or buy a silver mine; it's all one to me. I only thought as I couldn't get along alone, maybe I'd take a partner, and concluded to give you the first chance. Now what do you say?"

"I ain't used to makin' up my mind in a minute, and like to turn things round a little before I make a bargain. I won't say no, and I won't say yes, tonight, but if you are of the same mind tomorrow, and come around

about this time, you'll get your answer."

Uncle Jack took this as a dismissal for the present, and with a smiling "goodnight" departed, rather encouraged than depressed, for, thought he, "if she did not think well of it, she'd have said no and done with it at once."

Uncle Jack was as punctual as the clock the next night at the appointed place, and after having the subject shifted from one side to the other, his Dulcinea finally gave in by saying she supposed she might as well make up her mind to it; livin' with him wouldn't likely be much worse than with some others she knew of.

"I suppose, Barbara, you wouldn't be willin' to go to the parson's tonight?"

"Not much!" she replied, with a perceptible sniff. "I'm not in such a hurry as that to make a fool of myself."

"How about tomorrow then?" he asked anxiously.

"This time next week, and no sooner. I don't see anyhow what started you on this track at your time of life."

Uncle Jack smoothed down his beard. "There were several things seemed to combine. First, there was the blossoms all comin' out at once, and somehow or other they always make me think of brides and grooms and weddin's. Then the robins are buildin' nests by the hundreds, you might say, but I don't know but I got the first idee from Shakespeare."

"Jake Spear! And what business is it of Jake Spear whether you get married or not? If there is anything in this world that I hate, it's a man that don't

know his own mind and is afraid even to sneeze without he gets leave."

"Shakespeare isn't a man," mildly replied Uncle Jack; "or I suppose he is too, either a man or a woman, I ain't quite sure which it is, but Shakespeare writ a book I've been readin' lately, and there was one piece struck me, called—called"—he was about to say "The Taming of the Shrew"—"called—well, it was a kind of a story of a man who wanted a wife, and was determined to have her, and he got her and she turned out first class. His name was Peter something, and hers was Katherine. Then there was another fellow, and when he got married they called him 'Benedick the married man,' and that's what I'll be next week, by your leave, my dear, ha! ha!"

"For a man to want to be called Benny or Dick, when his name is Jack, is silly, and I'll give you fair warning you needn't expect any such nonsense from me."

"Just as you please, just as you please," returned Uncle Jack serenely. "As Shakespeare says, 'A rose by any other name would smell as sweet.' But tell me what I shall do to the house; inside I mean."

"Nothing at all," said Barbara. "I will have no old women gossips prying around. It's not likely to be clean, but there'll not be dirt enough to choke me before I can get it put to rights."

"It's not so bad as you may think," said Uncle Jack. "Debby kept it spick-span clean, and I've tried not to let it get much behind. But you shall do what you like about it."

Uncle Jack took his leave. He met at his own gate his nearest neighbor, Joshua Wilson, who often came in to take a smoke with him.

"Walk right in, Joshua," he said blithely; "I'm glad of your company."

Uncle Jack lighted the lamp, and Joshua, struck with his holiday attire, asked if he'd been to a funeral. Uncle Jack roared.

"If you'd said a weddin', you'd been warmer. The truth is, Josh, if you wait till this day week you'll find me settled down with a wife."

"That's startlin'," said Joshua. "I was thinkin' if you was going to keep chickens you'd need to get married. It takes a woman to tend to 'em. But who's the lucky woman?"

"Barbara Fury."

"Bab Fury! For the land's sake! Why, man, are you crazy? That cantankerous old serpent?"

"Hold on," said Uncle Jack, "I don't allow to have my wife called names if I can help it."

"Now Uncle Jack, you know you've no better friend in this world than me, and I wouldn't be doin' my duty if I didn't speak discouragin' of such a team as that. You might as well yoke together a lamb and a tiger, for you know as well as I what she is for temper."

"Yes, I know; but I've got an idee that we're goin' to suit, that is, after we get used to one another."

"I kind of enjoy," said Joshua, "a good smart shower in summer time. It freshens the arth and clears the air. I get that kind at home from my wife. It comes hot and heavy, but it's soon over; while a regular cold nor'easterly drizzle that gives you crawls up your back, that's too warm for a fire

SLIM AND SPUD

How Shocking!

Eastman's Chestnuts
Free In Book Form

Because everybody likes a laugh *American Agriculturist* has prepared a book that is made up of page after page of Editor Ed Eastman's Chestnuts. Well bound and attractively printed, it makes a wonderful little gift to cheer up a sick friend—but you won't send it to a friend until you've laughed through every line yourself. You can get one free by renewing your *American Agriculturist* subscription for four years for two dollars, or six years for three dollars. This offer is good only until June 15. Mail your order to Jim Hall, *American Agriculturist*, Ithaca, N. Y.

and too cold without one, I hate, and if there's anything that will wear the life out of a man, it's an eternal scold. Think well, Uncle Jack, and be thankful for a little warnin'."

"I'm not easy scared, Joshua; come see me this day three months, and we'll compare notes."

Joshua Wilson was not the only one in the village thunderstruck at Uncle Jack's choice. He had calls and friendly warnings by the dozen, but to all he returned the same answer—that he expected to abide by his choice.

The wedding came off at the time appointed. Barbara was escorted into the house by the front door in Jack's best manner.

"Welcome home, my dear," he said, giving her a rousing kiss, to which she rejoined, "Don't be a fool, Jack, but tell me where to lay off my bonnet."

"Look at this first," said Jack, opening the door of the little parlor and pointing to an iced cake which stood upon the table. He had ordered it from the city, and the two doves billing on top had been his own suggestion.

"What do you think of it? It was baked in the city."

"Then you may know it is only fit for the pigs, made of stale eggs and strong butter," and she walked up stairs to take off her things.

Uncle Jack's eyes twinkled.

"Not fit to eat, only good for the pigs," he repeated, "Well, here goes!" and raising up the cake he marched with it out to the pig pen, and tossed it over to the pigs. Then he brought in the plate, placed it on the table, and sat down to read his newspaper.

Barbara evidently found matters upstairs more to her mind than she had expected. There were piles of soft blankets, comfortables, and bedding of the very best, while everything was as clean as a new pin.

Seeing the plate, she asked, "What did you do with the cake?"

"Gave it to the pigs, and they really seemed to like it," he said, in his usual tone.

"Can't you give a civil reply to a civil question?" she said tartly.

"Why, my dear, you said the cake was only fit for the pigs, and as I don't propose to feed you on any but the best of food, I took it right out to them."

"Jack Dalrymple! you're enough to provoke a saint!" and she flounced into the kitchen, where she found the kettle singing away and the table spread for supper.

"It's one of two things," she admitted to herself; "either Jack is a fool, or I have got my match."

So the days wore on, Jack always assenting to Barbara's propositions, however absurd, which often caused considerable damage and derangement; but Uncle Jack never lost his temper, though he was often the greatest sufferer through her whims.

One afternoon she had been chasing

the chickens from her flower beds, and, as Uncle Jack headed them off, he remarked, "Them's fine chickens, Barbara."

"Fine chickens, indeed! I wish every one of them had their necks twirled," and in a rage she dashed into the house.

"Hum!" said Uncle Jack. Into the coop he went, and ere long nearly a dozen hens lay in a row outside.

"Would you like me to help you pick them?" he asked, innocently, putting his head in at the kitchen door.

"Talk sense and I'll answer," she replied snappishly.

"I thought," he said mildly, "the chickens had better be got ready to-night, if they are to go to market in the morning."

"What chickens? Jack Dalrymple, what do you mean? You never have gone and killed all my chickens?"

Opening the door, and seeing the row of headless fowls lying in full sight, she sat down and cried.

"Why, Barby," said Jack, a little more scared than he cared to show. "Did you ever ask me to do anything that I did not humor you in if I could? I hated awfully to kill them Shanghais, but you said you wished their necks were twirled, and as they were yours, I did as you wished."

"The finest chickens I ever saw," mourned Barbara, "and laying eggs so steady, too. I'd rather they'd scratched up every green thing in the garden than to lose them."

But without saying more, she went out with Jack to pick the chickens. Barbara's face was still very grave as she stood looking at the chickens, ready dressed for market, lying on the kitchen table.

"Do you know, Barby," asked Jack, his eyes twinkling, "what is the reason these chickens will have no hereafter?"

"No," said she shortly.

"Because they have had their necks twirled (next world) in this, ha! ha! ha!" But no smiles appeared on Barby's face.

Uncle Jack harnessed up the light wagon next morning and went off to market and returned by noon. He brought with him, tied in pairs, a dozen chickens of the choicest breed he could find, and placing them in the coop he threw them some corn and went into the house.

The subdued look was still on Barbara's face, making Jack mentally exclaim, "She hasn't got over it yet."

He handed her a roll of bills.

"There's your market money, Barby," and went to hang up his coat.

"Come with me," he said, taking her by the hand, and leading her out to the coop. "Now I want you to take all the pleasure you can in these. I'll build you a chicken yard and fence it off so you will have no trouble."

She glanced at them and then at him. Her lip quivered.

"You are better to me, Jack, than I

am to you."

"Not a bit of it," he replied, putting his arm around her and kissing her. "I am well satisfied with my part of the bargain. I had an idee, and I carried it out, and, as I said before, I am satisfied."

As they sat together after tea, Barbara said, "You are always talking, Jack, about your idee; what do you mean by it?"

He gave her a curious look.

"I'm afraid you wouldn't like to hear it."

"I'll take the risk, for I know it is something I am mixed up in, isn't it?"

"Well, you are warm, as they say in the game. And as you promise not to mind, I'll let it out. You see I wanted a wife, and as I looked around, I thought of you. Now I'd heard that you wasn't easy to get along with," stammered Uncle Jack, feeling as if he was putting a lighted match to a bomb-shell.

"Go on, Jack," she said composedly. "I know worse things about myself than you can tell me."

"I had an idee," he continued, "that maybe the reason you wasn't always-always—easy-like in your mind, and maybe a little—rough," striving for as soft a word as possible, "might be because other folks have been cross-grained to you; so thinks I, if Barbara is treated right she will come round; the good is all in her just waitin' to be drawn out, and so I've found it."

"I have always heard that Jack Dalrymple was a friend to everybody, and that everybody was friendly to him; but I never knew how good you were until I had a trial of you; and I want to say once for all, that I'm goin to be as good a wife to you as I know how, and if the old Adam crops out now and then, as of course it will, just shut your eyes, as you've done all along, and shame me out of it. And if there's anything you would like me to do that will give you pleasure, just let me know."

"There is one thing I would like, if you would agree to it," said Uncle Jack. "We have been married now about three months, and I'd like to give a tea party—just a few of the nearest neighbors to supper; and I would like if you'd be just as pleasant to Joshua Wilson as you can."

"He never liked me, I know," she said.

"That was because he never knew you."

Barbara laid herself out for that party, and out-did Uncle Jack's fondest expectations. Such waffles, stewed chicken, peaches and cream, and other delicacies had never been seen in that house before.

Joshua Wilson was placed at the right hand of the hostess and received special attention, which so astonished him that he could scarcely eat for wondering; and he gazed at Uncle Jack in such a dazed sort of way that the host could hardly keep his mirth from exploding. As he bade him good-night, he said, "What was that you called her, Josh? 'Cantankerous old serpent,' wasn't it?"

"Hold on, Uncle Jack, I'll surrender! For the first time I can wish you joy of your wife, with all my heart. Such a change really makes me feel as if the millennium might have begun to dawn."

The End.

— A. A. —

If any school or public institution would be interested in having old copies of the *National Geographic* magazine, we suggest that they write to Perley M. Eastman, New York State Department of Agriculture & Markets, Albany, New York. Mr. Eastman feels that these magazines are too valuable to dispose of as wastepaper and he would be very happy to give them to a school or institution that would pay transportation charges.

Only 10 More Years
and I'll Be 65...

Then I Can Retire

Yes, thanks to my Farmers and Traders retirement plan, I can retire when I'm 65, with an income that will let me live comfortably and travel when and where I please.

You too can plan for retirement if you act now. Find out about the new Farmers and Traders policy that combines retirement and family protection in one low-cost policy.

THE LIGHTHOUSE MART SCITUATE, MASS.

Housework
Easy Without
Nagging Backache

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

Kernels, Screenings and Chaff

By H. E. HANCOCK

SINCE I came north in mid-April, I have had more visitors and more mail than I ever remember receiving in a similar period of time. Most of my mail has been about so-called farm programs. Many of my visitors have wanted to talk about their ideas for farm programs.

I must confess the whole experience has left me cold.

Super-Planning

Those farm programs which have been presented to me differ from other farm programs only in degree. Sometimes the difference depends entirely on one group's stepping in to manage American agriculture in place of the group which is already in power.

Now I don't know whether or not American farmers, in order to have a decent standard of living and feed the nation, are going to have to have a farm program. But if they do, we all had better stop kidding ourselves about the implications of any programs which require any degree of government participation beyond the fields of research, education and law enforcement. *They mean just one thing—more or less regimentation.* And like pregnancy, regimentation is a progressive thing.

Public Welfare

At the moment, agriculture has the worst press and the worst public relations of any substantial group in the country. Even John L. Lewis is not in as bad repute as the nation's potato farmers.

Now I'm not blaming potato men. Hundreds of thousands of them didn't want the price supports which put them in the dog house. But I am attempting to make a definite point.

Any farm programs which are not in the public interest — whether farmers are completely regimented or only partially so — inevitably will end in disaster for farmers. The only safe and sensible program for agriculture is a *food and farm* program, and I am suspicious even of it if it is based on government management. Fortunately, a plan for making a market for milk, meat, eggs, butter, cheese and fresh fruits and vegetables can be put over without government participation.

The nation's population is increasing. The proportion of its food-producing livestock (Unimals) is decreasing. Nutrition education — a legitimate function of government — is being undertaken on an increasing scale. *Better Meals for More People* is the only solution of farm surpluses which looks possible without more or less government management of agriculture.

FARM NOTES

For the past two weeks I have been watching a herd of 21 Brown Swiss cows select their grazing. I

have come to the conclusion that what a cow likes and, particularly, when she wants it are entirely unpredictable. But one thing is certain — *cows like variety.*

The herd I have been watching has its free choice of rye pasture, winter barley pasture, native pasture, and a stand of brome grass and alfalfa which is very luxurious and in which the alfalfa plants now stand above the cow's knees.

In the two weeks I have observed these cows, they seem to want to do a little grazing every day on the old established pasture. As I have already reported, when they are on the stand of brome and alfalfa, they eat mostly brome grass. When they go to the rye and winter barley, they definitely prefer the rye to the barley.

The grazing selection I have been noticing, and the desire for variety which apparently exists are borne out by what the boys tell me about how these same cows ate last winter. Then they always had grass silage of good quality, and good quality mixed brome and alfalfa hay before them.

Jack says that under these conditions the cows would go several days without eating any hay to speak of. Then, suddenly, they would go for the brome grass, and later, quite inexplicably, show a preference for the alfalfa.

I guess there isn't much of scientific value to be drawn from these observations beyond the fact that variety in roughage seems important at least to the cow which eats the stuff. Can it be that she responds to some inner impulses which haven't yet been charted by the scientists?

Shy Cows

On the farms in which I am interested, the dairy cows are in pen stables and milked in elevated milking stalls. During routine milking, the cows have become so used to entering their stalls and standing there until they are milked that with many of them the boys don't even have to close the doors which keep them in their stalls. In fact, I once suggested to Jack that I thought we had gone to unnecessary expense building the doors and sidewalls to the stalls; that we probably could have gotten along as well had we just drawn chalk marks.

However, there are occasions when everything the boys have in the way of confining partitions and doors is needed to keep the cows in the stalls. These times are when a white-coated veterinarian shows up, or a gal comes in wearing a white dress. Basically, I think that cows associate anything white with a vet whom they expect to stick needles in them, and therefore they take no chances.

It is also noticeable that a cow which runs free all the time is harder to tie and hold than a cow

which has had her spirit broken by standing hour after hour in a stallion whether she enjoys it or not.

As they have become experienced with elevated stalls, the boys have learned to break their first calf heifers to these stalls by letting them follow milkers through them for a month or so before they freshen, and by giving the heifers a little grain in the stalls so that they come to look on them as nice places.

Paved Barnyard

For the past three years as we could afford it, we have been paving the barnyard at Sunnysables. We now have the unique set-up of a cow stable with no floor in it — this is our so-called "bedroom" for loose cattle — and a barnyard which is completely paved. At least on one count the arrangements make sense. There's a roof over the barn.

To scrape our barnyard and paved areas where the cows eat and drink and congregate, and our pen stable, Jack has a blade which quickly fits onto the manure fork on the tractor. Until we completed our paving job, he had to push the scrapings into a pile and then fork them into the manure spreader. When we put in the last block of paving, we dug a pit for the manure spreader so that it could be set right at the edge of the paving. Now, when Jack cleans the paved area, all he has to do is push the scrapings over the edge of the pavement and right into the spreader. I believe I've mentioned before that these scrapings make excellent top-dressing for pastures, since there is little or no straw in them.

I hope soon to have a picture of this set-up for this page.

Trench Silo

After studying our trench silo at Sunnysables with four separate groups of engineers, and discussing how we might stabilize the walls permanently, we decided to take the cheap and easy course and merely clean it out with a bulldozer, thus restoring the walls to about their original slope. We also put through-out the length of it two strips of concrete two feet wide on which to operate our trailer and tractor when the silage is removed.

These strips provide a pavement which will be of some use in the future if we decide to abandon the trench silo idea entirely and use it for a road.

Meanwhile, we have some good people figuring on how to stabilize the walls permanently at not too great expense, and we have kept our total investment down to about \$250.

By the time this is published, we expect to have started filling the trench with unchopped spring growth of brome grass and alfalfa.

Spring Growth

Ever since farmers called the attention of experiment stations and agricultural colleges to the possibilities of grass silage, the specialists have been fumbling around for a fool-proof definition for grass silage.

For my money, Dr. Charles Rogers of the Ohio Experiment Station has come up with the best definition yet. He says that grass silage is the product which is made from the *spring growth* of pastures and

meadows. Thereby, in one phrase, he describes the source of grass silage and indicates the very important time when good grass silage can be made.

First Crop

Before we left Florida this spring, we bought a place in Ft. Lauderdale. On this place is one of the nicest mango trees I have seen in that area. This season the mangos started blossoming, as I remember it, in December, and bloomed a second time in February. At any rate, when we left our place in early April, our tree had on it a heavy crop of mangos about the size of my fist. By May 15 these were ripe enough to pick, and our friends have been shipping them to us so that they have been arriving nearly every day for the past week.

If there is any better fruit to eat out of hand than a mango, I've yet to taste it. There is only one drawback. A really ripe mango is so full of juice that the only sensible way to eat it is to take off one's clothes and sit in the bathtub.

Now that our mangos are being harvested and we've had a taste of them, we are looking forward to the next crop we expect to get — avocados. When we left in mid-April, we had two avocado trees on which there was a very heavy set of fruit, about pea-size.

Ladino Grazing

Two weeks ago I reported on the condition of an improved pasture on Boots' place in which the brome grass, particularly on areas which had been top-dressed with manure, was apparently on its way to choking out the ladino.

Since I made this observation, the cows have been really at work on the brome grass and, as a result, more ladino is showing up. Boots and I have talked the matter over and we are going to try to save this stand of ladino by top-dressing the field sometime in June with perhaps 300 pounds of 0-19-19, and then letting the field rest for a few weeks.

Rye for Silage

A few mornings ago a reader of this page called me up to ask about making some silage out of rye. It seems that he had a field which had gotten away from him and was showing such rank growth that it was beginning to lodge and he was worried about his seeding.

We had the same thing happen last year and did make silage out of a stand of winter grain which was mostly rye. The experience was not altogether a happy one. As might be expected, the rye fermented all right and kept well, but (even though it had been cut up in fine pieces) basically it was still stemmy rye when we came to feed it out, and as such wasn't very good roughage.

This spring, except for one small piece on which there have been no grass seedings and from which the boys expect to get their seed grain, we are keeping all our rye fields in check by *both* grazing and clipping because, like the farmer who telephoned me, we are more interested in the seedings than we are in the rye, particularly after it has served its purpose of supplying late fall and early spring pasture.

With AMERICAN AGRICULTURIST Advertisers

If you are interested in combines, a postcard to INTERNATIONAL HARVESTER COMPANY, P. O. Box 7333, Dept. AA, Chicago 80, Ill., or the coupon which appears on page 7 of the May 6 issue will bring you booklets describing the three McCormick combines.

Northeastern farmers are thinking more and more about the advantages of irrigation. Why not send a postcard for a free folder to W. R. AMES COMPANY, 3905 E. Broadway, Tampa, Fla.?

While you have your pen handy, also drop a postcard to the ALUMINUM COMPANY OF AMERICA, 2186-D, Gulf Building, Pittsburg 19, Pa., and ask for a copy of "Portable Sprinkler Pipe Lines to Profit."

To get best results from sprays for insects or disease, a farmer needs full information. From ROHM & HAAS COMPANY, Washington Square, Philadelphia 5, Pa., you can get four excellent bulletins for the asking. They are: "How to Boost Potato Yields," "Insect Control on Fruit and Vegetables," "Disease Control on Vegetables, Fruit and Ornamentals," and "2,4-D Chemicals for Weed Control."

There is nothing like a picture window to improve the attractiveness of a house. These days, most "picture" windows are "Thermopanes" made up of two panes of glass with space between for insulation. You will find the "Thermopane Book" very interesting. You can get it from LIBBEY-OWENS-FORD GLASS COMPANY, 2855 Nicholas Building, Toledo 3, Ohio.

A relatively new remedy for mastitis is aureomycin. Information about its use is available in the form of a folder available without cost from the Animal Industry Section, LEDERLE LABORATORIES DIVISION, AMERICAN CYANAMID COMPANY, 30 Rockefeller Plaza, New York 20, N. Y.

While you are writing, why not ask for a copy of the new edition of "Control of Poultry Diseases"?

Fly time is here again. You can get a free illustrated folder on fly control from the CALIFORNIA SPRAY CHEMICAL CORPORATION. Send your request to 147 Railroad Avenue, Lyndonville, N. Y., or to 150 Bayway, Elizabeth, N. J.

Miss Ann Carlton Hadley of Washington, D. C., and the new Diesel Orchard Tractor manufactured by the R. H. Sheppard Company, Hanover, Pa. Miss Hadley was chosen Queen Shenandoah 23rd, at the recent Shenandoah Apple Blossom Festival, and the R. H. Sheppard Company's new Diesel Orchard Tractor was there presented to the public for the first time.

SERVICE BUREAU

By H. L. Cosline

IT'S YOUR SERVICE BUREAU

IF YOU have a problem, write us. We are always willing to advise readers on any subject on which we feel competent. If we can't help you, we will tell you so.

The Service Bureau warns against unreliable concerns and money-grabbing schemes. We arbitrate and adjust differences of opinion between subscribers and commercial concerns, and attempt to secure payment for farm produce sold to produce dealers and commercial firms. We investigate the reliability of commercial concerns. We offer a reward for information leading to the imprisonment of swindlers, cattle thieves and chicken thieves. In addition the Service Bureau is glad at all times to help any reader in any way possible.

There is nothing we dislike more than to tell a reader that we cannot help him, yet that is sometimes necessary. The Service Bureau is not a legally licensed collection agency, and there are certain types of claims we cannot handle.

The Service Bureau cannot attempt to settle differences of opinion between relatives or neighbors, nor can we try to secure money due on notes, for labor done, or for rent and board. Complaints should be made promptly. We have found it practically useless to try to settle claims over a year old, and the sooner they are sent to us, the better chance we have of getting results.

We do not have a lawyer on our staff to handle legal questions, and many letters that come in deal strictly with legal problems. In these cases, we can only advise the subscribers to consult attorneys. Occasionally, we get a request for aid from a reader who has already put the matter in the hands of a lawyer. Whereas it might be a type of claim we ordinarily could handle, once it has been turned over to a lawyer, we cannot enter into it.

There is absolutely no charge to any subscriber for any service we are able to render. We do get results in a surprisingly large number of cases. Write American Agriculturist Service Bureau, Savings Bank Building, Ithaca, New York.

GOOD WORK!

The other day a letter came into the office from Arthur Henry of Waddington, N. Y. It told of his persistence in tracking down and bringing to justice three thieves who stole sheep from his property. There was almost nothing to go on, but he managed to ferret out enough clues here and there to land the culprits in jail. Our most sincere congratulations go to Mr. Arthur Henry and to Justice of the Peace J. Albert Wright for the sentences he gave. Here is the subscriber's own story of the incident:

"Last year I signed up for American Agriculturist, and I have on my barn the Protective Service Bureau sign. Believe it or not, I had two sheep stolen within 30 feet of it. It happened on February 17, 1950, although I didn't miss the two sheep until March 3. I immediately alerted the St. Lawrence County Sheriff's Office. As there were no clues, there wasn't much they could do.

"I did want to find the guilty party, so I continued looking around and questioning friends and others. One day, quite by chance, a man told me of hearing a couple of men talking about a sheep one of them had bought from a cattle dealer and four days later sold back to him. Mention was made of two men in a hen house with hens.

"That was my clue. I checked cattle

dealers and found two possibilities. I contacted Sheriff Frank Northrup, and he talked with one of these dealers. The man admitted buying two sheep and selling them in good faith. The Sheriff then went to the home of Judson Palmer who under questioning admitted taking my sheep. Also involved were Clarence Middlemiss, 17, and Marvin Middlemiss, 18. Palmer, 23, was given 90 days in the county jail; Clarence was placed on probation for 90 days and ordered to make restitution of \$10; and Marvin was sentenced to 45 days in jail."

— A.A. —

RAD SELLING

Last fall a man made a phone call from Portland (Maine) and asked for authorization to use my name in sending cards to disabled veterans at Christmas time. I am hard of hearing so my daughter answered the phone and relayed the message to me. After assurance that there would be no expense to me, I gave them permission. Soon we received a bill for \$10 for an ad in a magazine. I don't intend to pay it, but I get a bill every month.

Certainly our subscriber is right in refusing to pay this bill. Here in the Service Bureau we feel that the telephone is being misused when an attempt is made actually to sell goods or services over it. Of course, the magazine can claim that the situation was not misrepresented, but certainly our subscriber's word is as good as theirs. Anyway, in our opinion no responsible magazine would try to sell advertising by any such method.

— A.A. —

FINANCING A CAR

The National Better Business Bureau emphasizes the importance of a careful study of any agreement you make to buy a car, either new or used, on the partial payment plan. The Bureau states that the vast majority of car dealers and finance companies are reliable but that a few are not. They suggest that before you sign a contract you obtain in writing the following information, not in one lump sum but in separate items.

1. Cash delivered price including specified extras.
2. The exact amount allowed in trade, if any.
3. Finance charge, and for how long.
4. Cost of insurance and coverage provided.

THE FARM PAPER OF THE NORTHEAST

Just for a Day the Past Lives Again

By Jared Van Wagenen, Jr.

Bill Stempfle who for more than twenty-eight years has been Farm Bureau Agent of Steuben County, New York.

SOME few weeks ago I received an unexpected and very delightful letter. It was from William ("Bill") Stempfle, Farm Bureau Manager for Steuben County, New York, and what it said in effect came to this:

"We are planning as a tribute to the past an old-fashioned Farmers' Institute, to be so far as possible a reproduction of the type of agricultural meetings held in the state between 1886 and 1918, back in the days when what is now the Extension Service was a part of the New York State Department of Agriculture at Albany instead of being administered by the State College of Agriculture at Ithaca."

The letter also included a very gracious invitation to me which I accepted with more pleasure than I can remember as related to any happening of recent years.

Bill Stempfle has been Manager of the Steuben County Farm Bureau for more than twenty-eight years. There is an old country saying that you must both "summer and winter with a man before you really know

him." Now Bill has been very intimately summering and wintering with Steuben farmers for almost a generation, and if they do not know him by this time, it would seem that they never will. Most of the farm people who were middle-aged when he began his work have gone on into the silence, and it is the schoolboys of those years who have now taken their places and are carrying on.

Naturally Bill has come to be something of a law unto himself, and many of his policies are made right under his own hat. They tell me that his plans do not always coincide with those of the Central Office, but in the end it is Bill who usually wins out. I do feel that to a very exceptional degree he has won the confidence and regard (or shall I use the warmer term "affection") of his farm constituency. I first came to know him in the early years of his reign, about the time that the Farmers' Institutes were changing over into College-sponsored community meetings, and I have always admired him for his boundless enthusiasm and energy. Today he tells me, "I've got a wonderful job." As a

matter of fact, he is so in love with his work that for several years past he has not taken a vacation. You see there are so many things he wants to do, and so little time. However, that sort of devotion brings its own reward. It is pretty satisfying to be recognized over a long period of years as heading up the agricultural activities of a fine farming county such as Steuben.

We counselled by correspondence as to just what were the distinctive features of the old-time Farmers' Institutes which set them apart from present day community meetings and Extension Schools. We agreed that if we were to have an authentic revival of the past, then these things must be a part of the program.

First, we agreed, there must be an opening prayer—an echo of the bygone years when more often than now it was the custom to invoke the Divine blessing upon any undertaking. By the way, there was an Institute tale to the effect that many years ago a very literal-minded preacher at Ellenburg prayed that "the speakers may understand their topics"—surely an entirely proper and reasonable request.

When in 1812 Elkanah Watson was promoting the first Agricultural Fair in America under the "great elm tree" on the Common of Pittsfield, Massachusetts, he felt the need of a preacher to implore a blessing upon the new enterprise, but the severe Puritan Divines of that era were suspicious that his Fair was in reality the work of the Devil rather than a new venture in agricultural education and a number of them declined the honor. Eventually, however, one more daring than the rest was willing to undertake the responsibility, and Elkanah records with much satisfaction that the preacher "delivered an eminently appropriate invocation." (Continued on Page 16)

♦ A group of Farmers' Institute Lecturers in 1905. Many of our older New York readers have heard one or more of these lecturers. How many of them can you identify? The picture which appeared in "The People's Colleges" by Dr. Ruby Green Smith is produced here by permission of the author and of the publishers, the Cornell University Press.

Fresh Eggs

EVER eat an egg that tasted flat or strong, or had a slight "off" flavor? Some people have never tasted any other kind. Such people don't eat many eggs.

Good prices depend more on high egg consumption than on anything else. Restaurant and grocery men will tell you that their customers will eat many more fine, fresh eggs than they will those of fair or low quality.

In marketing your eggs G.L.F. has these points driven home every day. On the wholesale egg markets, buyers know what kind of eggs housewives are looking for. When they find fine quality eggs they'll pay good prices

for them. When there are plenty of eggs on the market—and there are plenty now—quality can make the difference between profit and loss.

That's why your market men keep urging you to protect that nest-fresh quality. That's why everything is done to deliver the egg to the buyer as nearly as possible in the same fresh condition it was when picked up at your farm.

Let's work together on this. Ask the man on the G.L.F. pick-up truck for suggestions on keeping that nest-fresh quality on the farm. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

Quality is a Team Play

Your Part

Keep nest-fresh quality by gathering 3 or 4 times daily, cooling promptly in a moist room. Clean and pack daily, grading carefully for size. Store in cool, moist place until shipped.

G.L.F.'s Part

An insulated, ventilated truck picks up the eggs weekly at your farm, takes them to a G.L.F. Egg Station where they are cooled overnight. Next morning they are inspected and shipped in a special egg transport to the market, retaining that same farm-fresh quality.

G.L.F. Egg Marketing Service

This new, modern barn replaces one that Tilley lost in a fire in 1947. The silo suffered very little damage. The barnyard and fences indicate the neat appearance of this Rensselaer County dairy farm.

Home Grown Grain Cuts Costs for Ernest Tilley

FIFTY ACRES of level, rich, well-fertilized tillable land are in pasture on Ernest Tilley's dairy farm at Hoosick in Rensselaer County, New York. His recognition of the fact that good pastures produce the cheapest milk, plus the steps he has taken to offset the cost of government-supported Western grains, enables him to go on making a well-earned profit from his 60-cow dairy despite declines in milk prices.

Ernest went through fire and flood to build up his labor-efficient, well-managed 203-acre place, but took his setbacks in stride, realizing that they could have been worse. When his barn burned to the ground in 1947, he was thankful that his year-old silo was of tile and lost to the fire only the framing around the chute, the wooden doors and five tiles. He started a new barn that fall. When the spring flood of '49 took five acres of his very best land down the Hoosick River, it was a blow, but with bulldozers and other modern power equipment it didn't cost him too much to rebuild the course of the river and slope off the washed area

Ernest Tilley keeps costs down and profits up by growing and mixing half the grain for his milk cows. The corn on the cob he is shown here putting in his hammermill is mixed with oats and bran.

so that he had two acres back in production by this spring.

The new 36 by 100-foot aluminum-roofed barn has 40 stanchions, plus bull and calf stalls. The stable is all sealed and insulated with cement-coated asbestos flexoboard, with temperature and humidity controlled by a two-fan ventilating system. His herd, which is mostly Holsteins, some registered and some grades, is let out for exercise every day in the winter for a few minutes or several hours, depending on the weather. His two bulls are a grandson and a double grandson of

Newmont Farm's Newmont Aristocrat.

In addition to 12 acres of corn for silage, Ernest grows 12 acres of corn for grain and enough oats to give him a mixture that really cuts the amount of his grain bill. He harvested 1,600 bushels of ear corn on the 12 acres last year. He grinds together in his hammermill 4 shovels of corn on the cob, two shovels of oats and one of bran—the latter to add bulk—and ends up with a supplement that ranges between 12 and 14% protein. This homegrown, home-ground grain is all the heifers and dry stock get. The milk cows get the same mixture plus an equal amount of purchased 20% protein dairy ration to bring the average protein content of their grain to about 16%.

By actual trial and checking production figures, Ernest has determined that his cows produce just as well when half of their grain is homegrown and half purchased as when they are on 100% commercial 16% dairy ration. He also found that as soon as he cut the commercial ration to less than half of the total, his cows' production started slipping.

The very orderliness of the farm saves costs. No time is wasted rounding up cattle, because the fences are kept in high perfect condition. There are no wide hedgerows to shade and to waste land, and no rubbish heaps to puncture tractor tires. He isn't a crank on the subject but it's one of those farms where everything is in its place and where all the work is done with one hired man plus a part-time boy in the summer. And, perhaps the most important feature of all, it makes money.—Jim Hall.

—A.A.—

RAISE YOUR GRASS SIGHTS

EVERYONE agrees that more and better grass is sound for this northeastern dairy country. The experiment station and college men have shown us that they know how to grow it, and many dairymen have demonstrated that such grass is a money maker.

With that set-up, why are there so many mediocre meadows and pastures in the Northeast? There are many reasons, but among them may be the tendency for many of us to think we are supplying the seed, plant food, and management for grass when we really are doing just half a job. Don't forget that the better the grass, the more lime and fertilizer it needs. Let's raise our sights and shoot at a real target.

Now is a good time to visit a few top dairymen to compare the grass they are growing with that on your own farm.

KOWTOWLS

A NEW AND EASIER WAY TO PREPARE YOUR HERD FOR MILKING

STRONG WHEN WET

"I've found Kowtowls good and strong and they don't go to pieces when wet—you can practically scrub with them." — CHARLES Lewis of Rock Tavern, New York.

"Kowtowls make it easy to get ready for milking. Just take two pails—one with fresh Kowtowls and with disinfectant solution right down the line with us. I like the idea of using one on a cow and then throwing it away."

SURPRISED... AND SOLD ON KOWTOWLS

"I was really surprised to find a disposable, single service paper towel that could be used to wash udders and teats before milking," says WISNER BUCKBEE of Warwick, N. Y. "I expect to use Kowtowls from now on."

Produce Cleaner, Better Milk

KOWTOWLS, the new sanitary, single service paper towels make washing and massaging of teats and udders before milking easier, more practical, more sanitary and less expensive.

Easy to Use

To prepare a cow for milking, simply dip a KOWTOWL in clean, warm disinfectant solution, wash udders and teats, then wring out KOWTOWL for massaging and drying. When you are finished, throw the KOWTOWL away.

Save Time and Trouble

That's all there is to it! Send for FREE sample and see for yourself. No more tiresome washing, boiling, sterilizing old-fashioned, hard-to-clean cloths and rags. No wasted disinfectant... your solution stays clean... good to the last.

Control the Spread of Mastitis

There's no chance of a KOWTOWL spreading mastitis from one cow to another during the washing operation. Each KOWTOWL is used on one cow and then thrown away.

HANDY FOR YOUR OWN USE, TOO—
Users say Kowtowls are a handy thing around the barn for their own use—to dry hands, wipe up tables, carts, etc., and they even find their way into the house. Send for FREE samples.

Endorsed by Veterinarians, Inspectors, Dairymen

Here at last is the practical way to give your herd the added protection of single service washing. KOWTOWLS have been tested and approved by Cornell University, University of New Hampshire and Utah State Agricultural College.

For better, cleaner milk... lower bacteria count... the grade of milk inspectors want and buy at top prices, use KOWTOWLS.

Your Milk Plant or Feed Store Has Them

You can get KOWTOWLS from your local milk plant or at most feed and dairy supply dealers. Ask the quality control man at your milk station, or have them leave KOWTOWLS when they pick up your milk. KOWTOWLS cost as little as \$1.70 per cow a year.

If You Can't Find Them

We'll gladly send you FREE samples to try out if you can't find them yet in your community. KOWTOWLS are new and we haven't been able to supply all milk stations and stores yet—but we want you to see what a good job they do. Just send this coupon or a penny postcard. KOWTOWLS are a product of Brown Company, producers of Nibroc Towels for industrial use.

THE BIGGEST CHALLENGE OF ALL

IT IS A never failing source of inspiration to look into the faces of a graduating class and think of the great army of young men and women who are starting a new chapter in their lives with great hopes and ideals. Graduation is well named "Commencement," for of course it is only the beginning and not the end. It was Charles Kettering, famous scientist and industrial leader, who tore up his diploma when he was graduated from college because he didn't want to think that he had finished anything. On the other hand, it was Olds, the automobile manufacturer, who said, way back in 1912:

"The car I now bring out is regarded by me as close to finality. I do not believe that a car materially better will ever be built, so I have called it my farewell car."

That was in 1912, mind you!

A young man visiting with me in my office recently said:

"The frontiers are all gone. There's not much left for my generation to do."

Fifty years ago a young man looking ahead could have made the same foolish statement with even more reason, for marvelous as have been the material changes of the last fifty years, we have only just scratched the surface. Not the most imaginative member of the Liar's Club can prophesy what the next fifty years will bring forth! We only know that nothing is ever finished. What wouldn't any member of my generation give to stand in the shoes of this year's graduates and live to see what they will see during the course of their lifetime!

But most of the progress of the past fifty years is material. It is based on gadgets, and we know our civilization cannot continue unless spiritual progress is kept abreast of material progress. Someone has said that we are ahead of the ancient civilization of the Greeks in nothing but our plumbing! Unless we can find a way—and soon—to balance material with spiritual progress by growing spiritually as well as materially, we may commit world suicide by means of our own marvelous gadgets.

That is the greatest of all challenges facing today's young men and women as they start now to lead the world to better things.

A BAD PEST

I HAVE never seen so many woodchucks as there are this year. We planted one of our gardens quite a distance from the house this spring and bombed out the woodchucks in eight or ten nearby holes. Soon after the peas came up, the woodchucks began eating them as well as the new lettuce, and we found that another bunch had moved in and dug new holes. We have bombed them, and are keeping daily watch for the next batch.

When the bombs are used according to directions, they get the chucks. But there are so many of them that it seems to be an unending job. When I think of the horses' legs that have been broken or injured in woodchuck holes, of the broken machinery caused by them, and of the total amount of good forage hay that woodchucks have ruined, I wonder why there isn't a concerted effort made to exterminate these pests.

TOUGH ON GRANDFATHER

A DOCTOR friend of mine who specializes in bone diseases, particularly of children, told me about a little boy who was brought to him with tuberculosis of the joints. "In trying to find a cause," said the doctor, "I asked about the milk supply and found that the herd that supplied the family milk had never been tested for TB, and that the grandfather who owned the herd was opposed to such testing and to pasteurized milk."

"It was tough," continued the doctor, "to have to tell that grandfather, who idolized the little boy, that the TB in the child undoubtedly came from

his dairy herd." A later test of the herd showed several cows with T. B.

Then the doctor went on to tell me that undulant fever, caused by unpasteurized milk from herds that have Bang's Disease, is more prevalent than the public realizes, and that the only safeguard is pasteurization of milk.

Personally I can sympathize with the many people who prefer unpasteurized milk, because I do. And I drink lots of milk. It's the finest food in the world and just about the most necessary from a health standpoint. But I know enough about the conditions under which milk is produced, and about the danger of its transmitting disease so that I would never dream of using it until it is pasteurized.

EXCELLENT APPOINTMENT

THE appointment of Harold Creal of Homer, New York ("Cap" to his friends) as Director of the New York State Fair is good news. Mr. Creal is a successful farmer and a long-time member of the New York State Legislature, and has proved by his life and works that he has a deep interest in public affairs. His experience and high ability well fit him to lead in the organization and conduct of the New York State Fair, one of the State's most important enterprises.

AESOP BROUGHT UP TO DATE

ONCE UPON A TIME there was a Farmer who raised two chickens, took them to the city, sold them to the Factory Worker, and with the proceeds bought two shirts. So the Farmer had two shirts and the City Man had two chickens.

Observing the transaction, the Planner told the Farmer he could get more money for his chickens by making them scarcer. If he didn't raise so many he could get more income for those he did raise.

The Planner also told the Working Man in the city that he must work fewer hours and get more money for his labor. This would raise the prices on the articles he made so he would have more money with which to buy. So, the Farmer brought one chicken to the city market. He got as much money for it as he had previously gotten for two chickens. He felt fine. This was the life! But when he went to buy some shirts he found that the shirts had also doubled in price. So . . . he got one shirt!

Now the Farmer has one shirt and the City Man has one chicken, and this is called either "The Planned Economy" or "The More Abundant Life."

—N. C. Seedsmen's News

A GOOD WORD FOR THE MAILMAN

WE ARE so used to modern blessings and conveniences that we take them for granted. I often think of how I used to ride a horse bareback to the village post office, once a week to get the mail and compare it with the R.F.D. service which delivers mail to almost every farm door in the United States every day.

On most farms the coming of the mailman is the big event of the day, not only because of the mail he brings but especially because almost all of the R.F.D. carriers are cheerful, patient, long-suffering and dependable, no matter what the weather conditions are.

If you feel as I do, locate your mail box where the carrier can reach it handily and take time once in a while to tell him that he is doing a good job.

THEY BELIEVE IN THEIR PRODUCT

SOME milk producers are really waking up to the necessity of advertising their products just the same as every other manufacturer does. For example, ninety dairy farmers in Somerville, New Jersey, have voted to deduct 10 cents a hundred pounds for advertising. Raritan Farms, their dealer,

contributes an equal amount. A committee of three producers has been set up to decide how best to use the money to convince their customers that milk is the best food in the world and that they ought to use more of it.

"AN OUNCE OF PREVENTION—"

AS YOU READ THIS, count up the number of days a year that you use each piece of your farm equipment. You'll be surprised, for the average use per year for most implements is less than twenty days. On the average, a binder is used only 7 days, a combine 11, a two-row cultivator 14, hay-loader 9, mower 10, and a two-plow tractor 57 days.

In the old horse and buggy days the life span of a walking plow was nearly 34 years. Today the average life span of most equipment is less than 10 years. The reason is that modern machinery is much more complicated and cannot take too much neglect.

I seldom ride through the farm country without wondering why farmers aren't more careful about storing their expensive machinery. Much of it rusts out before it wears out. The lack of plenty of lubricating oil on all moving parts will soon ruin any machine. The length of life of a modern farm machine is more dependent upon oil than upon any other factor. In the rush to get work done, many farmers will neglect to make a repair that they know should be made. Then it takes twice as much time and money to make the repair finally.

The cost of equipping a farm is necessarily higher than ever today. That makes it vitally important to cut costs by taking care of equipment.

SUPER-SALESMAN

This is an old one, but it is always good for a laugh:

The world's greatest salesman, according to legend, was a milking machine agent. He sold a machine to a farmer who had one cow. Then he took the cow away as a down payment.

EASTMAN'S CHESTNUT

ONE TIME years ago I drove up in front of a farm and looked out to see a farmer with a pitchfork chasing a well dressed city man down across the yard, both of them yelling at the top of their voices. The stranger went over the top of the gate without even touching it, climbed into his car and, with a great snarling of gears, went away from there fast.

I hesitated for a moment, wondering if I might not be chased off also, but when I finally got to the farmer he was leaning on his fork, breathing hard, but kind of grinning, and he said:

"That's the most fun I've had in six months!"

It seemed that he had a long-standing argument with a New York City milk barn inspector, and the uppity ways of the inspector had finally become too much for him.

Inspectors are better now, but some of the old-time ones were pretty tough, though there was sometimes two sides to the argument. Most dairy farmers now are highly cooperative in keeping their barns sanitary, but there were some in the old days who weren't. There was, for example, the young college fellow who was making a survey. Stepping into a farmer's barn at milking time, it was plain to him that the barn hadn't been cleaned for a month, flies were plentiful, the cows' flanks were plastered with you-know-what. The farmer looked up from his milking to say:

"You ain't a barn inspector, are you?"

The boy was quick to assure him that he wasn't.

"Well," said the farmer, "it's a good thing or I'd have throwed you out. One of those fellers was here from the city trying to tell me what to do with my barn. Said I ought to have concrete floors. Dumb fool! That shows how little them so-called experts know. But I put this feller in his place all right. I grabbed me a spade and all I had to do was dig down six inches to show him he didn't know what he was talking about. I got concrete floors!"

AA's Farmers' Dollar Guide

MILK: Prediction that fall and winter milk prices will be higher than previously expected seems justified. This will be welcome news to northeastern dairymen, who have been squeezed between lower prices and continued high production costs. Feed grains went up from 5 to 10 cents a bushel recently. It is expected that the June crop report will show some improvement in wheat, which may bring downward turn in grain prices.

Following a hearing at Elmira last February, the U. S. Department of Agriculture has proposed an amendment to the order which would raise the price of Class 3 milk by about 3½ cents. The Metropolitan Producers' Bargaining Agency is filing some exceptions or objections to the amendment. The evidence the Agency introduced at the hearing indicated that costs of making butter and cheese had advanced and that the allowance for manufacture should be increased to encourage manufacturers to buy more Class 3 milk. By the time the proposed amendment could be put into effect, it would be too late to do any good this year.

Anyway, the difficulty has been to sell Class 3 milk at the present price, so it is difficult to see how it would be any easier to sell it for more money. An increase in the allowance which manufacturers get for manufacturing milk would create a market and help keep distress milk off the New York City market—milk which is now going there to be used for price cutting, which continues to be as bad or worse than when we last reported.

POULTRY: There is considerable basis for the belief that poultrymen who weather the present low price period will be making profits next fall. Poultrymen are buying about 12% fewer chicks than last year.

It is sound business to keep old hens as long as they are laying, but it is also advisable to house pullets before they reach 5% production on range. One way some poultrymen are managing is to use "hen shelters" on range. Hens are moved there early in the summer but are not confined except at night. This gives time to clean the laying houses and still move in the pullets on time.

CCC INVENTORY: Around June 1st, the Commodity Credit Corporation owned 3½ million bales of cotton, 255 million bushels of corn, 127 million bushels of wheat, 439 million pounds of linseed oil, 88 million pounds of dried eggs, 99 million pounds of butter, 316 million pounds of dried milk, and 386 million pounds of rosin.

Under loan to CCC (which they may own eventually) were 543 million bushels of corn, 305 million bushels of wheat, 2 million bales of cotton, and 332 million pounds of tobacco. For the 10 months ending May 1, the Commodity Credit Corporation had a net loss of 155 million, just a little over one-half million dollars a day.

CREDIT: The public is using credit more liberally. Administration policy seems to be to favor easy credit as a help in maintaining business and prices. Proposal of government guaranteed loans to small businesses is one angle; easy credit on housing another. Recently *Wall Street Journal* commented it was easier to buy a home on credit than an automobile. Most farmers figure they should borrow less rather than more at this time. However, the mortgage debt on many farms recently bought has averaged 50 to 55% of the purchase price, which is equal to or greater than the price of these farms 10 years ago.

The present tendency of economists to analyze the business outlook every day reminds us of a man who takes his pulse and his temperature every hour. Business might be less jittery if left alone for longer periods.

CHANGES: Among changes predicted by Dr. Sherman Johnson of U. S. Department of Agriculture which should be studied by farmers are: continued increase in farm mechanization; more supplemental irrigation; a shift of small unproductive farms to part-time operation; some increase in size and some decrease in number of family farms; a rapid adoption of conservation practices; increased farm efficiency through greater use of lime and fertilizer; better feeding of livestock; better crop varieties, and more effective control of insects and diseases.—H. L. Cosline.

The Song of the Lazy Farmer

THE GALS are smart when they pick June to start upon their honeymoon; no other month in all the year is quite so fair and filled with cheer. The earth is green, the skies are blue, and ev'rything looks fresh and new; the temperature's exactly right, it's good for sleeping day and night, the gentle sun upon your back rules out the danger of attack by rheumatiz, yet ain't too hot like August will be, like as not. Especially if you're on a farm, it's hard to see how any harm can come to you as long as June is playing out its cheerful tune.

Both stock and crops upon the land are growing up to beat the band; the heavy springtime work is through, what jobs there are this month to do Mirandy and the hired man will handle better than I can. Which means I can relax a bit while neighbor has another fit because I won't help him today put up the year's first crop of hay; but it won't hurt if I don't go, he knew beforehand I'd say no. With hungry fish

down in the crick, to toil would surely make me sick; besides, my reputation soon would be lost if I worked in June.

it pays

Spraying CARROT CROP with Esso Weed Killer 35

to weed the Esso way!

Esso Weed Killer 35—is proving a great help in vegetable farming in eliminating harmful weeds. It is being used effectively on carrots, celery, parsley, and parsnips; and is being tested on other crops. Proved by tests at several state farm experimental stations, this product has saved time and work in cultivation ... produced large and healthy yields for great profits!

CONSTANT ESSO RESEARCH aids the FARMER

At one of America's largest and most modern petroleum research centers, Esso engineers and technicians are constantly seeking ways to make farming easier, better, more profitable. New products and methods are developed and tested in co-operation with state farm experiment stations to meet farming problems.

ESSO EXTRA MOTOR OIL—for Extra engine protection ... Extra oil economy in your car, truck, or tractor.

ESOLUBE HD MOTOR OIL—just right for heavy-duty diesel or gasoline tractor and truck engines. Dependable all-weather service for rough going.

ESSO EXTRA GASOLINE—gives tremendous power, long mileage and high anti-knock performance under load!

ESSO TRACTOR FUEL—for "distillate" burning tractors. High power, smooth efficient operation ... low flashpoint for fast starting.

ESSO STANDARD OIL COMPANY

The Great New DEARBORN LOADERS

**Self-Contained
Hydraulic Controls**

Can be added to basic "Standard" Loader!

Best loader idea in years . . . three great Dearborn Loaders for the Ford Tractor, all using the same basic frame! Each loader can be purchased complete. The new Dearborn line means you can always get the loader that best fits your needs. You pay nothing for extra power or parts until you need them. The Dearborn "Standard" Loader, shown above, lifts 750 pounds by Ford Tractor Hydraulic Touch Control; dumps by trip lever. Just add a few parts to get the Heavy Duty Loaders described below!

DEARBORN MOTORS CORPORATION • DETROIT 3, MICHIGAN

"Heavy Duty" conversion kit changes "Standard" Loader, (see large picture) to "Heavy Duty" Loader, above. Adds a hydraulic pump driven by tractor's crankshaft, capacity to 1,000 pounds. Tractor's hydraulic mechanism left free for rear-attached implements.

"Hydraulic Bucket Control" is added to the "Heavy Duty" Loader by another conversion kit, adding a two-way hydraulic cylinder for pivoting material bucket or fork. Load can be held, dumped or partially dumped at desired height.

**Material Bucket, Manure
Fork and Crane Attachments
Interchange on All Models!**

Material bucket, manure fork and crane attachments for Dearborn Loaders are sold separately and can be used on any of the three models. Manure fork is shown in large picture, material bucket in the two pictures at left, and crane attachment in small picture at right. All sturdily built for many years of hard use.

Ask your Ford Tractor dealer for a Demonstration

Your nearby Ford Tractor dealer will gladly demonstrate the Ford Tractor and the new Dearborn Loaders on your farm, without obligation. See or phone him soon!

Ford Farming MEANS LESS WORK . . .
MORE INCOME PER ACRE

We Make Grass Silage the Easy Way

By MARK ROBINSON

Wyoming Co., Pennsylvania, Dairyman

UNDER the influence of *American Agriculturist* I have gradually changed from corn silage and hay to straight grass silage for my winter roughage. My cows get no dry hay and eat an average of 100 pounds of grass silage a day.

As I felt my way along over a period of years, I had all the doubts and worries that you hear now on every side. With the benefit of hindsight, I now wonder what all the fuss is about. By nature, a cow is designed to make milk on May and June pasture. To preserve her feed for winter, we have three known methods—also used for vegetables. I like my vegetables frozen and, if it were economically possible, I believe the cows would like grass kept that way. In changing from hay to grass silage, my cows have switched from dried to canned food—a change we humans gladly made when we learned how to can.

We have known how to make grass silage for a long time. Why has it suddenly become the best practice? In my opinion, a revolution in the kinds of machinery available to the farmer has made grass silage possible. When our grass crop was handled largely by hand, it was important to dry it in order to reduce its weight. It was so important that we dried it, despite the difficulty and the great average annual loss of food value. No one wanted to lift all that water five times on the way from the field to the hay mow to the cow.

Now we can mechanize our winter forage completely. We can take grass in the field, put it into storage, take it out of storage, feed it to the cows, and put the manure back on the ground, without touching anything by hand. The key machine in this change is the forage harvester.

Editor's Note: We who edit *American Agriculturist* believe that the grass silage prizes offered by northeastern fairs in 1948, and which were originally sponsored by *American Agriculturist*, had a lot to do with the speed with which the grass silage idea has developed.

We use a cutterbar-equipped chopper to load two old dump trucks. The trucks dump the grass into trench silos. Our manure loader takes the silage out of the trench in the winter and loads the trucks again. We have to throw it from the trucks into the feed bunks by hand, but we won't next winter because all we need is a conveyor on the truck to unload it. Many farmers have built this accessory and it can be bought ready made.

The cows unload the feed bunks and make milk and manure. The manure that falls outside is scraped into a pile with a jeep snow plow, and then loaded on the spreaders with the manure loader. The manure that falls inside in the penstall is loaded directly with the manure loader. The spreaders put all that is left of the grass back where it came from.

This past winter it took three tons of grass silage to produce a ton of milk per day. If you count the snow plow moving of some of our manure as half a move, our forage moved seven and one-half times on the round trip from the field back to the field as manure. Roughly, we figure we handled over 3,000 tons of material once. If our trucks had conveyors to fill the bunks, we would have done it all while sitting down pulling levers.

We made about 550 tons of silage in 18 days with a crew of four. We put up all our first cutting in the last week in May and the first two weeks in June.

We did no work at night or on Sunday, and my wife thought I was a white collar man. Including breakdowns with the old trucks, and all the troubles you always have, we averaged one ton per man hour. Our peak capacity with everything perfect was over four tons per man hour.

We have never used any preservative in making our grass silage. I have heard about grass silage that was too wet, but I have never seen it. You can figure how much ours wilted in the time it took it to move from the cutter bar on one end of the forage harvester pick-up to the chopper knives on the other end.

In making silage in a trench, I feel it is important to back the loaded truck over the silage. This packing practically eliminates spoilage, but in order to make the silage support the loaded truck you must prepack with a lighter outfit. We used our jeep, but a tractor would probably work as well.

Our operation worked as smoothly as an assembly line. I doubt that the best and most elaborate equipment made could make hay on an assembly line basis. You have always got the weather, even with a mow finisher. Judged by the way a cow behaves on spring pasture, she likes her grass wet. With modern equipment, it is cheaper to handle your winter forage wet than to dry it. If you dry it, it only soaks up with water in the cow's rumen anyway.

— A. A. —

HEROIC MILK DRIVERS

The Milk Industry Foundation of New York has announced the names of seven milk men scattered throughout the country who have been awarded Pasteur medals for heroic service in line of duty. Typical are the records of three from the Northeast.

F. A. Maple of Collar City Creamery, Troy, saved the life of an eight-year-old boy who had broken through the ice into 15 feet of water. Mr. Maple crawled out on the ice with a rope where the boy was hanging by the edge and grabbed him, and men on shore pulled them in by the rope as the ice began to break.

Morris Toll of Abbotts Dairies, Philadelphia, captured a burglar who had robbed the home of a customer.

Louis Rogers of Abbotts Dairies broke into a burning house, got water from the kitchen and put the fire out before the fire department arrived.

Information Needed

The records of the New Jersey State Horticultural Society, organized at New Brunswick on August 17, 1875, show that Professor George Thurber of Lodi, Bergen County, was the first president.

We would like to locate one or more of the direct descendants of Professor Thurber in connection with the 75th anniversary of the organization meeting held at New Brunswick.

—Arthur J. Farley, Secretary
N. J. State Horticultural Society
New Brunswick, N. J.

Editor's Note: We are printing Professor Farley's letter in hope that some of our readers will be able to give us information relative to the direct descendants of Professor George Thurber so that we can forward the information along to Professor Farley.

**High-powered...
low-priced!**

P*L

ADVANCE-DESIGN TRUCKS

More for the job . . . more for your money! With the most powerful engine ever built by Chevrolet, P-L trucks are advance designed to offer you even greater advantages.

Here are trucks that can handle tougher jobs . . . trucks that can do your hauling faster, easier—with outstanding economy!

Always strong, always sturdy, Advance-Design Chevrolet trucks are built to last. Over rough roads and on the highways, they'll carry the load for you . . . and keep on doing it!

Yes, Chevrolet P-L trucks are far ahead. Check them for payload, performance, popularity, price. And check them for features. No other trucks give more . . . yet Chevrolet trucks cost surprisingly little to buy, to operate, to maintain. See your local Chevrolet dealer today.

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICH.

Performance Leaders**

On the hills or on the straightaway, the efficient new Chevrolet P-L trucks are far ahead in performance. They give you high pulling power over a wide range of useable road speeds—and high acceleration to cut down total trip time.

Popularity Leaders**

In every postwar year truck customers have bought more Chevrolets than any other make of truck—convincing proof of the owner satisfaction they have earned through the years—proof that Chevrolet is America's most wanted truck.

Payload Leaders**

For low operating costs per ton mile, smart buyers choose Chevrolet P-L trucks. They are advance designed to cut running and repair costs. Their rugged construction lets you deliver the goods with real reductions in operating expense.

Price Leaders**

From low selling price to high resale value, you're money ahead with Chevrolet trucks. Chevrolet's rock-bottom initial cost—outstandingly low cost of operation and upkeep—and high trade-in value, all add up to the lowest price for you.

Plus all these Plus features: TWO GREAT VALVE-IN-HEAD ENGINES: the new 105-h.p. Load-Master and the improved 92-h.p. Thrift-Master—to give you greater power per gallon, lower cost per load • THE NEW POWER-JET CARBURETOR: smoother, quicker acceleration response • DIAPHRAGM SPRING CLUTCH for easy action engagement • SYNCHRO-MESH TRANSMISSIONS for fast, smooth shifting • HYPOID REAR AXLES—5 times more durable than spiral bevel type • DOUBLE-ARTICULATED BRAKES—for complete driver control • WIDE-BASE WHEELS for increased tire mileage • ADVANCE-DESIGN STYLING with the "Cab that Breathes" • BALL-TYPE STEERING for easier handling • UNIT-DESIGN BODIES—precision built.

"ON THE FARM" STORAGE SAFEGUARDS YOUR CROP PROFITS

Crops stored in fire-safe Quonsets assure you of
full Government Price Supports

Permanent, all-steel Quonsets provide safe storage for all types of grain. Quonset's arch-ribbed, clear-span design offers maximum usable space, and Quonsets can be partitioned to meet varying crop needs. The durable, versatile Quonset assures you of economical storage for many years to come.

Quonsets provide safe storage for your feed grains . . . and permit you to hold your cash crops for higher prices and profits! And you can save more of your corn—use your corn picker to best advantage—by drying ear corn in the Quonset 32 corn storage drying building, as illustrated!

- quick erection

More Family Living from the Farm

By RALPH S. WILKES

SIGNS point to the fact that the farmer is getting caught in the squeeze between the falling prices of the things he has to sell and the rising costs of farming operations and family living. In a period of a falling price level, history shows that the prices of raw materials always fall faster than the prices of manufactured goods.

The farmer is a producer of raw materials which he sells at wholesale, while most of the things he uses are manufactured goods bought at retail. All about us we see the fallacy of attempting to overcome this situation by increasing his size of business in a country where farm surpluses are already a major problem. Beyond a certain point the farmer cannot increase his selling price per unit of product. Perhaps, then, the answer to his problem lies in the reduction of costs.

One of the important ways to reduce these costs is through the production of more food and other items for family living. How important are these items to the average family? What changes are justified in view of the present farm outlook? To answer these questions the vocational agriculture students and veteran trainees of the Penn Yan Public Schools recently made a study of the amounts and values of the things produced for family living on their home farms during the past year. Only surveys concerned with typical farm situations were considered in

the final summary, which included 42 farms. As you can see in the table below, the average value of products produced on the farm, not including the value of living quarters, was \$764.00.

Item	Families Using Home-Raised	Per Farm Quantity	Value
Fuelwood	23	22 cords	\$ 90
Milk	29	2700 lbs.	108
Butter	10	107 lbs.	64
Eggs	31	126 lbs.	56
Poultry meat	26	102 lbs.	32
Beef	15	252 lbs.	88
Veal	2	75 lbs.	35
Pork	25	250 lbs.	87
Lamb	2	75 lbs.	32
Potatoes	28	18 bu.	26
Garden vegetables	36	—	69
Apples	23	10 bu.	14
Berries	14	43 qts.	14
Other fruit	8	—	39
Maple syrup	3	2 gal.	10

The average family included in this survey was 4.3 persons. Five families preserved much of their food in home freezers, while 24 rented freezer lockers for all or part of the year.

Most of those who contributed to this study felt that there had been a general tendency to produce less for home use during the past three or four years than in times when the prices received for farm products were lower. Most felt that it was again time to produce more for family living.

It has often been said that we give more attention to the feeding of balanced rations to our livestock than we do to our own diets. H. E. Babcock has written frequently in *American Agriculturist* on the subject of the up-

Does Your Farm Have a Cycle?

A County Agent Discusses Father-Son Agreements on Farms

By R. W. CRAMER

DOES your farm have a cycle? Many of them do, just like the price level cycle and others. People are just beginning to realize that too many do. I wonder if you know what I mean. Let's take Joe for an example. A few years ago Joe bought a farm. It was potentially a good farm, but it was run down. Neighbors say that years ago it was one of the most productive, best looking farms around. That's when the former owner was in his prime and his son was home with him. When he was about forty-five, his son rented another farm because of insecurity and lack of business agreements at home.

Soon after that the farm started down hill. Less seeding was done. Pastures weren't kept up. Less manure found its way to the back forty. The size of the herd was cut. The fertilizer bill went down. All because the farmer found himself slipping in his ability to keep up the pace. As a last resort he discontinued the milking herd altogether and depended on wintering heifers for resale. Soon after, Joe bought the farm.

Joe didn't pay a lot of money for the farm, but he is going to have plenty in it when he finally gets it in shape. Since he took over, a lot of plowing and reseeding have been done. Some of the new seedings were partial failures because lime and fertilizer were lacking, but he is working on that. Once more manure is going out to the back forty. He has fixed up some fences and put a new roof on the barn. And he found time to put a new front porch on the house. Soon, at the rate he is going, this farm will once more be one of the most productive in the community.

Joe now has a young son. If you've

followed me this far, you're thinking maybe as I am, "Is this cycle going to continue?" Are Joe and his son going to work things out for the good of both and for the good of the community on a business basis together? Is Joe some day going to have the satisfaction of seeing the home farm continue? Is he going to be able to enjoy a little freedom in his old age? Is his son going to take over by business means a really productive going farm? Or is the cycle going to be repeated?

George Cowles, Ashville, New York, and others who have been to England will tell you that these farm cycles aren't so common there. Why? Because most farmers do not own their farms there. Most farm land there is rented from the wealthy landowners. But many families have worked and rented the same farms generation after generation.

Today in this country farming is a business. Shouldn't we then adopt some business methods? Father and son agreements and landowner-tenant agreements afford the best methods of maintaining an investment on the one hand and of getting started in farming on the other. Today neither party can afford to let the opportunity pass. Young dependable help is not available as hired men for the aging farmers to turn to. And how many young farmers can swing a fifteen to thirty thousand dollar deal to start with?

Yet, because of a real lack of appreciation of the need and value of business agreements, few are even considering them. Isn't this problem of farm business agreements one which should be attacked? I think it is. If the shoe fits, I suggest you write your county agricultural agent for whatever material he has on father-son agreements.

A FORUM FOR Backyard Gardeners

QUESTIONS have been coming in from backyard gardeners since this column made its first appearance in the May 20 issue. The questions are welcome for two reasons: They show that the page is well read, and they'll make coming pages more interesting.

Dividing Tulips

Mrs. Lorin Palmateer of Highland, New York, wants to know when to divide tulip bulbs. It is not necessary to divide them every year, but when it seems desirable—say every second or third year—it can be done any time after the tops die down, even late in the fall. Dividing them late will lessen the weed control problem. If you already have divided some, you may have found that you didn't remember which colors were in what spot. If you want to retain a color scheme, it is a good idea to mark them while they are still in bloom.

Early bulbs furnish blooms at a time when they are most appreciated. Last spring I saw a nice display of crocuses and next spring I am planning to have about a dozen on each side of the driveway near the road, and the same number on each side of the front gate.

Fertilizing "Glads"

Joseph Murray of Syracuse, New York, asks about fertilizer for "glads" after they are up. It always has been my opinion that the number one requirement for growing any flower—or vegetable either—is to have a soil that is well supplied with organic matter and plant food. It may require several years to get a soil into top condition. There is nothing better than well-rotted manure for adding humus, but it is usually cheaper to add plant food in the form of commercial fertilizer. Around a ton or more of 5-10-5 per acre is not too much for an intensive crop. This is at the rate of about 4 to 5 pounds per 100 square feet.

A side dressing is not a substitute for plant food that should have been added earlier. It can be a "pusher" if some nitrogen carrier such as nitrate of soda or sulphate of ammonia is used at the rate of about 2 pounds per 100-foot row.

Iris Borer

Mrs. George Eager of Canastota, New York, reports that her iris, divided only two years ago, are badly infested with root borers. In the same mail a letter from Mrs. Harvey Stone-

house of Fort Plain, New York, gives her method of borer control. Here it is: Use 2 tablespoonfuls of 50% wettable DDT powder and 1 teaspoonful of a detergent powder (such as you use to wash dishes) to a gallon of water. Spray early in the spring, then just before the iris bloom, and a third time in midsummer.

My own experience has been that borers do not interfere with bloom for 3 years, and by that time the plants need to be dug up and reset. When resetting, I am careful to remove any that have borers.

Sawdust Mulch

Mrs. Eager also asked about using sawdust as a mulch in the garden, berry field, and flower beds. Unless you plant your strawberries by the hill system (cutting off all runners), don't use sawdust on strawberries. Neither would I use it on a vegetable garden, because a garden needs a mulch every year and soon you would have too much sawdust mixed into the dirt. It works well on raspberries where new canes push up from roots rather than starting from runners as strawberries do. It is also fine for blueberries.

The common idea that sawdust results in a rapid and drastic increase in soil acidity is not true. However, it is important to leave the sawdust as a mulch rather than to mix too much of it into the soil. The bacteria that cause decay temporarily tie up available nitrogen, and unless you add a good amount of a nitrogen carrier along with the mulch, your plants may temporarily suffer from lack of nitrogen. You will need around 2 inches of a mulch to control weeds effectively. I would prefer peat moss, but it is rather expensive, and Mrs. Eager says she can get sawdust for nothing.

Killing Dandelions

I have been trying a new stunt on dandelions. Fearing that the drift from spraying 2,4-D might injure shrubs, I used an old-fashioned sprinkling can. The first application was mixed at half the concentration recommended for a sprayer. The dandelions began to curl up on schedule time, and now I am trying a less concentrated mixture. The sprinkling can uses more of the mixture than a sprayer, but I think it is safer. If you try this idea, let me know how it works.

Path Edging

Last evening while some of my friends were chasing a little white ball around the golf course, I did some edging along a path next to a flower border. This not only adds to the appearance of both the path and the border, but if done early enough it keeps the grass from spreading into your perennials. Just stretch a string along the border and use a half round edger to cut the sod along the string. Then use a sharp hoe—and I mean sharp—to cut under the encroaching sod. The hoe sharpening can best be done with a coarse file.

Thinning Vegetables

About the time you read this, many of the crops in your vegetable garden will need thinning. At a casual glance the thick tops will give an illusion of thrift, but in most cases you don't eat tops and every plant needs sufficient room to develop normally. Don't ne-

DITHANE Protects Your Crops All Through The Growing Season

Potato blight hasn't a chance with DITHANE. Regular DITHANE spraying or dusting protects your crop from disease *throughout the season*—and gives you bonus bushels of finer potatoes.

Reason: DITHANE controls early and late blight *without retarding growth*. On thousands of acres, crops sprayed or dusted with DITHANE have consistently outyielded crops treated with other fungicides—by 40 to 70 bushels per acre.

Because it's tough on plant diseases, yet gentle in its effect on foliage, blossoms and fruit, DITHANE safely controls many diseases of many crops. Tomatoes, celery, cucurbits, onions—all benefit from DITHANE sprays and dusts.

See your dealer for dependable DITHANE dusts and sprays.

FREE—Send for these fact-packed folders. They'll help you grow finer quality crops.

AG-3—How to Boost Potato Yields.

MINRALTONE HELPS BUILD CHAMPIONS

Douglaston Lady Augusta. Only cow of breed to be classified as Excellent and have four Excellent daughters. One granddaughter sold for \$13,500 — a record price for a Guernsey bred heifer. Another brought \$14,500 — highest auction price for a Guernsey in 1949. A great-granddaughter sold for \$11,500, a record auction price for open heifers; and a half interest in a grandson netted \$15,000.

Famous McDonald Farms Herd Protected Against

HIDDEN HUNGER*

The 1,500 acre McDonald Farms, Cortland, N.Y. has a wide reputation for the all-around excellence of its herd of purebred Guernseys, led by the great Guernsey champion, Douglaston Lady Augusta.

Mr. K. C. Sly, manager for J. M. McDonald, owner, has fed Hidden Hunger* fighting MinRaltone regularly since 1943. Mr. Sly says: "As a safeguard for the health of the herd, we have fed Near's MinRaltone for the last seven years. We use a combination of all three recommended feeding methods — free access, premixing and hand feeding."

What MinRaltone will do for one breed, it will do for all. Follow the lead of successful stockmen — feed MinRaltone regularly, year round. MinRaltone protects against Hidden Hunger* because it contains 11 essential mineral elements with Vitamin D. Write for free MinRaltone feeding booklet and complete details.

NEW YORK'S WHEAT GROWING CHAMPS

When it comes to growing wheat, they can't beat Tompkins County, say these two area farmers, Elmer L. Miller of Trumansburg (right) and George Beckwith of Ludlowville (left).

Miller won first prize, an engraved trophy, in the New York State Achievement contest conducted by Pillsbury Mills. His Yorkwin wheat entry, weighing 60.8 pounds per bushel, was also second best in the United States contest.

Beckwith, who showed Cornell 595 wheat, placed second in the State competition and sixth in the nation in the white wheat classes. He received an achievement plaque.

Public Relations Emphasized at Eastern Producers Session

YOU must conduct a good public relations program on cooperative matters," W. L. Bradley, head of a Buffalo accounting firm specializing in cooperative work, told 700 delegates attending the annual meeting of Eastern Milk Producers Cooperative Association at Syracuse last week. "When the public has the facts, it is rarely wrong in its judgment," said Bradley, and added that "it is the cooperative's job to keep the public informed."

Herbert L. Forest, assistant director of the dairy branch, USDA, praised the New York Milk Marketing Order as pioneering the pattern for other federal orders. He also urged support of plans to expand animal agriculture, stating that if animals and their products were used to the fullest extent as advocated by H. E. Babcock, "we would need more land to raise the things we need."

Dan Carey, assistant secretary of agriculture, urged producers to do some serious thinking about the future, pointing out that milk prices under the Order won't satisfy dairymen due to the feed prices being way out of line under government support prices of grain.

Kenneth F. Fee, New York State milk control director, said that the New York City milk price war had no apparent effect on total volume of milk sold. He added that daily average sales in New York City and Rochester were practically the same in '49 as in '48. No reference was made to effect of increased population. He also pointed out that increased production was responsible for only about 19 cents of the \$1.01 drop in uniform price in '49. Dollar payments for milk in '49 were down 10% from '48 and dairy costs down only 4.7%.

STEEL COMPANY HAS SHOW OF PRODUCTS

DIXISTEEL on Dixie Farms was the theme of the open house and Southern Agricultural Implement Show presented by the Atlantic Steel Company at Atlanta, Georgia last month.

At a preview of the show for about 50 editors, publishers and other press representatives, Atlantic President R. S. Lynch reviewed the struggle for existence of the little mill established in 1901 to produce cotton ties and barrel hoops and pointed out that this southeastern steel plant today covers 200 acres, makes 65 different products and provides jobs for 2,000 employees.

During a three-hour tour of the steel plant—from the scrap and pig iron piles to the loading area where finished steel products are shipped—the newsmen saw the roaring flames in open hearth furnaces, cranes moving white-hot ingots from the soaking pits, and flashing ribbons of steel being worked in various mills. At the farm and implement show more than 30 Southern manufacturers displayed products made from the Southern-made steel.

"MILK FOR HEALTH" MOVES TO ITHACA

"Milk for Health, Inc." has moved its office to 119 South Cayuga Street, Ithaca, N. Y. Up to this time the organization has been using office space loaned by the American Dairy Association of New York in the Onondaga Hotel, Syracuse, N. Y.

Ralph Eastwood, formerly with the Cooperative Research Division of the Farm Credit Administration at Washington, will serve as executive secretary of "Milk for Health."

Mr. Eastwood recently pointed to the fact that the latest report of the Milk Market Administrator cited the heaviest April milk production in twelve years, with 675 producers added to the New York pool since January.

— A.A. —

CERTIFICATES AND 13TH CHECK COMING

The Dairymen's League Cooperative Association, whose new address is 100 Park Avenue, New York 17, N. Y., has announced that new certificates of indebtedness and the 13th check will be sent out from the New York office on or before July 15. This 13th check, which dairymen sometimes overlook in figuring the returns on their milk, is a final accounting for the year made necessary because it is impossible to figure each month's return down to the last penny. Incidentally, certificates have been earning interest since April 1 even though they have not yet been received by members.

Oscar King of Malone, New York, was elected president of the New York Future Farmers of America at the annual convention at Waverly recently.

From the A. A. MAILBAG

THAT Carl Carmer story in the May 20 issue is captioned right: It's really a chestnut! Bet my boss and I started that story. Through the years I have seen many versions of it, but here is an honest to goodness true story!

In 1897, when I was 21—I got my first city job with J. B. Wattles Wholesale Commission House, corner of Perry and Michigan Streets on the old Elk Street Market in Buffalo, N. Y. I was a salesman on the walk with Mr. Wattles in the morning and candled eggs in the afternoon. My salary was \$11.00 a week.

Those were the days of no autos, and grocers drove to market and jammed the streets. Every day before closing, we checked our butter in boxes, tubs and prints, our eggs and our boxes of full cream (store) dairy cheese against sales (charge accounts) to see if anything was short. We had about 60 active charge accounts. Even if we were short 10 pounds of print butter, we would review the names of those that were in and we always found where Mr. Wattles (generally he) or I had charged the sale.

One night we were short a 34-pound box of cheese. We spent an hour on it and "no dice," but a 34-pound cheese was \$5.44 @ 16c a pound; so said Mr. Wattles, "Let's see who was due for a cheese," and we charged it to 14 customers of the 60 on his weekly statement which were due to pay every Monday. Eight paid the \$5.44 without comment. Six decidedly protested and we called it a "probable error." Then in came old Jim Garabee from his grocery on South Division Street. "Boys, I got a 34-pound cheese last Tuesday that is not on my statement and I want that added to my bill."

Mr. Wattles was honest and next week the statements of the 8 men that did pay were credited one 34-pound cheese @ 16c—\$5.44 due to error."

I just read the one about the man who spread maple syrup over his plate of potatoes and meat and so on. What a reprehensible way to use perfectly good syrup! Here is one that will line up with it if you have a place to print it:

"I put honey on my peas,
I've done it all my life;
It makes the peas taste funny,
But it holds them on my knife."

—W. B. Lewis, Machias, N. Y.

—A. A.—

AN AMERICAN VICE

WHEN THE late president of the Niagara County Bank came to Lockport, he asked the Bank's president what time they started their directors' and committee meetings. The president said they used to call the meetings for 9:30 a.m. but found that members did not get around until about 10:00, so they changed the time to 10:00, and then they got around about 10:30, etc., etc.

The late president took the position that meetings called for 10:30 a.m. should start at 10:30 a.m. I have been on the Board for something like twenty years since then, and I think I am correct in saying that every meeting I have attended has started within one minute of the call time.

On the editorial page of the April 15 issue you mentioned the importance of starting on time whether anyone is there or not. I think that advice is good.—F. J. L.

One of the advantages of selling fruits and vegetables at a roadside stand is that quality can be kept high.

Irrigation News

WEATHER:

Make your own!

FROM ALUMINUM COMPANY OF AMERICA

VOL. 1 NO. 3

NORTHERN EDITION

JUNE, 1950

IRRIGATES POTATOES WITH "BIG GUN" SPRINKLERS, GETS 660 BUSHEL PER ACRE

Butler County, Pa.—Farmers around here haven't been accustomed to giving much thought to irrigation. But last summer Wilbert Foertch, Butler Cy. potato grower, proved it can pay a handsome profit.

Weather in July and August was hot and dry. However, thanks to his use of portable sprinkler irrigation, Foertch harvested the biggest yield in the county's history—660 bu. per acre. Compare that with the state's average yield of 200 bu. per acre!

Mr. Foertch's young son, Earl, shows it's easy to lift a 20-foot length of lightweight Alcoa aluminum pipe—even the big 6-inch size.

Aluminum Takes Backache

Out of Shifting Laterals

More and more farmers insist on easy-to-move Alcoa aluminum irrigation pipe when they buy a portable sprinkler system. It weighs only about 1/3 as much as steel pipe—saves heavy work. For example, a 20-foot length of 4" aluminum pipe weighs only 16 pounds. That light weight makes shifting irrigation pipe a one-man job. Many farmers carry 2 or 3 sections at a time. Aluminum pipe is sturdy, long-lasting. It stands the gaff. Needs no painting or protection against weather.

WHERE TO GET IRRIGATION ADVICE

To obtain sound advice on portable sprinkler irrigation—consult your county agent or a reputable irrigation equipment supplier. They have access to the latest information on equipment and methods. They know the experience of other farmers near you who have used sprinkler irrigation successfully.

Minnesota Farmer Praises Sprinkler System . . . Extends Irrigation

Elk River, Minn.—Irven Hawkins' first year with sprinkler irrigation proved to him that portable aluminum equipment offers top yields—plus a whole list of "extras". He irrigated 30 acres of corn last year, more than tripled his yield. His irrigated land produced 124 bushels per acre, compared with an unirrigated yield of only 37 bushels per acre. Talking up the "extras" in a letter to the Moulton Irrigation Company, Withrow, Minn., Hawkins said, "For simplicity, lightness, durability and ease of operation, I cannot recommend your systems too highly". Incidentally, he is going to extend his irrigated acreage another 200 acres this year.

Is Farming Weather a Good Gamble Where You Live?

If your state is one where farmers generally rely on natural rainfall to make things grow, maybe it's never occurred to you to irrigate crops. Except perhaps in time of drought, when you've wished for a way to revive your withering crops. But that's not the main point of sprinkler irrigation. Farmers throughout the country have discovered that it is a profitable way to increase yields and improve crops in years of normal rainfall. The truth is—nature's rain seldom supplies the right amount of moisture at all the times it is needed to insure maximum plant growth. That's why it pays to own a sprinkler system. When you control the weather, profit is no gamble!

PICK THE PIPE THAT'S PORTABLE!

LIGHTWEIGHT, LONG-LASTING

ALCOA

ALUMINUM IRRIGATION PIPE

Lightweight Alcoa aluminum irrigation pipe is available in diameters up to and including 8 inches.

Sprinklers operate day or night with equally good results, except for slightly higher evaporation in bright sunshine.

When you buy aluminum irrigation pipe, look for marking, "ALCOA 63S-T6". It identifies a tough alloy, tempered for long, hard service.

Gulf brings you two great NEW gasolines!

1. *THE* NEW No-Nox

... designed for today's
powerful new engines!

Today's powerful new engines can't perform at their best with old-fashioned gasolines!

To get *peak performance*, fill up with the new No-Nox. Gulf scientists—working with leading automotive engineers—developed this fuel to give you whisper-quiet, knock-free power in your car!

You'll also get thrilling pick-up—easy, fast-firing starts—and unexcelled mileage!

And the new No-Nox gives new life, new pep, and stops knocks in older cars too—even many with heavily carboned engines!

2. *THE* NEW Good Gulf

... stepped up for better performance
at "regular" gasoline cost!

For years, Good Gulf has been a favorite gasoline with farmers from Maine to Texas. And now—

It's better than ever! It's been stepped up to give you even better all-around performance—whether you use it in cars, trucks or tractors!

If you want sure, easy starts and smooth straightaway power, you can rely on Good Gulf.

Get a thrifty tankful—today!

Now, more than ever, it pays to go—

A Visit With the Editor

PERHAPS it is because I am getting older and have a deeper sense of appreciation, but it seems to me that there has never been a spring when this Northeast farm country has been more beautiful than it is now. The spring was cold and slow in getting started; then suddenly came the miracle of the leaves and pink and white blossoms completely covered the old orchard back of the house and every other fruit tree and shrub, including some six different kinds of hybrid lilacs in our yard. It is surely a lilac and blossom year, for the whole landscape glows with beauty and makes it worthwhile to be alive and to have endured another long cold winter of our northland.

That is, it is worthwhile if we have developed some sense of appreciation. I wish every parent and every teacher would never miss an opportunity to develop appreciation of nature in the young. The other day I remarked to a friend that it seemed to me that I loved each succeeding spring better than any that had gone before. But it is sad that by the time most of us begin to understand and appreciate a little of our environment, it is time to die. If education does anything, certainly it ought to put us in closer touch and sympathy with our environment. In "Thanatopsis" you will remember that Bryant said:

*To him who in the love of Nature
holds
Communion with her visible forms,
She speaks a various language.*

But it does little good for Nature to speak to us in all "her visible forms," as she does especially in this glorious springtime, if we have "ears to hear and hear not, eyes to see and see not." The prayer of the teacher and the parent should be: "Teach us, O Lord, to help our children to see."

How tragic it is that most of us don't achieve much happiness because we are forever seeking the pot of gold at the end of the rainbow, the greener grass over in our neighbor's pastures, and have not learned to recognize and appreciate the diamonds in our own backyards. Says Henry Van Dyke:

*These are the things I prize
And hold of dearest worth:
Light of the sapphire skies,
Peace of the silent hills,
Shelter of forest, comfort of the grass,
Music of birds, murmur of little rills,
Shadows that quickly pass,
And, after showers,
The smell of flowers
And the good brown earth—*

*And when at last I can no longer move
Among them freely, but must part
From the green fields and from the
waters clear;
Let me not creep
Into some darkened room and hide,
But throw the windows wide
To welcome in the light.
Let me once more have sight
Of the deep sky and the far-smiling
land—
Then gently fall on sleep
And breathe my body back to Nature's
care,
My spirit out to Thee, Lord of the
Open Air.*

Our first appreciation should be of the privilege of association with the soil and with the plant and animal life, an association that strengthens character and cleanses the spirit. I have always objected to the term "dirt farmer," for dirt may mean something dirty or filthy, while the soil is the cleanest and most purifying thing in the world.

Ole Hansen used to be manager of a cooperative creamery in Nebraska. I remember his description of the seventh wonder of the ancient times, built by the son of Nebuchadnezzar, the Hanging Gardens of Babylon. "We are told,"

said Mr. Hansen, "that the wonderful aroma from the many millions of flowers in this ancient and magnificent garden was so strong that it penetrated the air for miles and miles."

Then Hansen compared the Hanging Gardens of Babylon with a modern alfalfa field: "As I traveled," he says, "through this fertile valley with its hundreds of acres of alfalfa in bloom, and as I inhaled the sweet scent coming off those floating fields, I could not help but think of what a wonderful garden spot this Nebraska alfalfa field was. I thought about the ancient Gardens of Babylon, and I realized that

right here we can discount them a million times with our valleys full of sweet smelling alfalfa."

Ole Hansen knew the art of appreciation. But we don't have to go to Nebraska. What is more beautiful than a northeastern apple orchard in bloom? Or for that matter, a growing crop of any kind, a fine herd of dairy cows "kneedeep in June," the woods and the meadows with their thousand shades of green? No land in all the world is so rich in things to see and appreciate as is our own northland.

One of my most cherished memories is of father on a Sunday afternoon starting off for a walk across his farm. I can see him yet as he went walking slowly down the lane, hands clasped behind his back. I can see him as he climbed his fence and sat there for

a long time, looking across the meadows, the fields of corn, potatoes and other crops that he was growing in partnership with his God. Father wasn't an expressive man, but I am sure that as he looked at these things and realized his partnership with Nature, he had a satisfaction, a sense of real happiness, which came from his ability to appreciate the simple, good things of life.

I know, too, that at the end of a long season's work, when Father went to his barn filled with the results of his labor, saw the cattle in their stanchions with their heads all turned one way waiting eagerly to be fed, there came again a glimpse of the thing we call happiness.

Well do I remember how Mother,

an OLIVER Crawler is better!

When spraying schedules must be met in spite of mud... when seeding steep slopes... when soil is sandy or sticky or soft—that's when an OLIVER Crawler pays off!

OLIVER Crawlers are built especially for the diversified farm in sizes and models to handle a multitude of ordinary and odd jobs... from land clearing to caring for cultivated crops. The versatile Model "HG", for example, is available in four tread widths—31, 42, 60 and 68 inches—and with ample clearance for work-

ing in row crops. And, the mighty Model "D" has plenty of power to hustle along multiple implement hook-ups in large scale operations.

Ask your neighborhood OLIVER dealer to help you pick the power that meets your requirements best. Also available is a full line of soil-saving machines that fit OLIVER Crawlers—loaders, 'dozers, terracers, etc.—plus a wide variety of mounted and trailer-type tools. The OLIVER Corporation, 400 West Madison Street, Chicago 6, Illinois.

SENSATIONAL NEW *Anti-Rust* FARM FUELS

prevent rust and corrosion
that clog fuel lines, pumps,
jets and damage fuel tanks

Condensation causes water to form daily in fuel tanks. This water rusts and corrodes your whole fuel system.

How fuel jet clogged by rust speck causes stalling, sluggish acceleration, sudden breakdown.

RD-119—the miracle anti-rust chemical now blended into all Sinclair fuels—stops rust and corrosion by coating your tank and whole fuel system with an invisible water-proof film.

So get top performance plus anti-rust protection—at no extra cost. Phone or write your local Sinclair representative today.

SINCLAIR

OTTAWA
Mule Team Tractor

7 Riding Models

Famous OTTAWA MULE TEAM and CHIEFTAIN series. Sizes from 5 to 20 HP. Engineered for longer life. Each model outstanding in performance, economy and lowest factory-to-user prices. Thousands in use. All have auto steering and excellent working visibility. Plenty of implements for plowing, mowing, planting, discing, harrowing, etc. 5-HP OTTAWA CHIEFTAIN shown at lower right has shortest turning radius of any riding tractor. Priced only \$342.

OTTAWA WALKING TRACTOR shown at lower left pays for itself in short time. Complete less tools only \$119. FREE details on all models. Rush inquiry today. OTTAWA MFG. CO., 1-031 Garden St., Ottawa, Kans.

"It's Handy"

A SOLDERING HELP

When soldering, if the metal is difficult to stick, try heating the material that is to be soldered. You will get a much smoother job, as the solder does not cool so quickly and has time to imbed itself in the joint on which you are working.

The three important factors in getting a smooth workman-like job of soldering are to have the right kind of solder, have the surfaces to be joined chemically clean, and to have the tool and the material hot enough so that solder will flow freely when it is applied to the joint.—I.W.D.

—A.A.—

OLD ICE BOX

A good way to make use of an old ice box is to use it for a teat cup solution rack holder. All you have to do is cut holes the size of the solution jug through the top and screw the rack on the inside. Have the jug sticking out about one foot and a half so you will have plenty of room for your teat cups. In this way the solution will be less apt to freeze during the winter.

Your teat cups will not get dirty and be thrown over by cows coming in and out of the barn. — Roger A. Labonte, Newmarket, N. H.

—A.A.—

KEEPS SCREWDRIVER FROM SLIPPING

When a screwdriver tends to slip out of the slot of a very tight screw, I apply a little oil and emery dust or fine sand and the screwdriver will hold very much better.

Sometimes a tight screw can be loosened by setting a punch on the head and tapping it with a hammer or on a screwdriver set in the slot. Holding a very hot rod or soldering iron on the head will also help to loosen it.—I.W.D.

—A.A.—

A HOME-MADE LEVEL

Make your own level. Fill a small flat bottle with water. Cap it and lay it on its side. A small bubble will appear. The surface the bottle is resting on is level when the bubble is centered. —Grace Coonfield, Clovis, N. M.

Readin', 'Ritin', 'Rithmetic, Plus Repairin'

By L. F. LEE

Vocational Agricultural Instructor, Newark, N. Y., High School

ATTENDING school in a farm machinery repair shop may not be everyone's idea of a proper educational procedure but it has proven very popular with vocational agricultural students at the Newark, N. Y., High School.

This year a group was excused from other high school classes in order that they could devote full time for three consecutive days to working on maintenance of farm tractors right in four local farm machine repair shops.

Tractors were brought in from the students' farms and overhauling was done by the boys under the direction of skilled mechanics. Emphasis was placed on maintenance jobs but major overhaul jobs, such as installing new gears, cylinder sleeves and piston rings, were done when necessary.

This type of training was started by the Newark vocational agricultural department three years ago with one local shop cooperating. Other shops joined in until this year four local

dealers were giving instruction in maintenance and overhauling.

The boys were given credit for school attendance as the work was under the supervision of the vo-ag instructor. Strangely enough, or perhaps not so strange after all, some of the boys who were not working to full capacity in their regular school classes, obtained excellent grades in the mechanical jobs.

Local tractor repair shops cooperating this year were: The Jackson-Perkins Co., A. G. Hutchinson Co., Arcadia Oil Co., and J. J. O'Meal Farm Machinery Sales and Service Co.

The training had the following advantages:

1—It was practical. 2—Work was done on a commercial scale, using modern tools and methods. 3—The boys repaired tractors from the home farms, working on the tractors of their choice. 4—Experience was gained which will prove invaluable to them in maintaining tractors on the home farm.

Newark, N. Y., High School students learn how to repair and maintain tractors by working right in commercial repair shops. The above group worked 3 days at the Arcadia Oil Company's Allis-Chalmers service shop. From left, they are: Lester Pulver, instructor; Donald Legee, Edward Roemer, Robert Klahn, Robert Hall, Principal; Sidney MacArthur, Elmer Frank, Conrad Mohr and Thomas Corkhill.

Purebred Ayrshires enjoying the sun on an early spring day at Brook Pine Farm near Hobart, Delaware Co., N. Y.

From 4-H Club Member to Dairy Farmer

FOR YEARS, parents and grandparents had to take on faith the value of such organizations as 4-H Clubs, Boy and Girl Scouts, and Future Farmers of America. They just hoped that the training the kids received would show up later. Now many of the boys who were members of such groups are farming for themselves, and many of the girls are making homes for young farmers.

For example, there is Ralph Gould who is now running Brook Pine Farm near Hobart in Delaware County, New York. Among the ribbons and prizes which he won as a boy is an *American Agriculturist* Achievement Award medal presented to him in 1935 for his excellent work as a Boy Scout. However, it is fair to say that in activities which pointed him toward farming, 4-H Club work holds first place. As a Club member he was interested primarily in purebred Ayrshire cows and for 6 years prior to 1940 he showed the Champion 4-H Ayrshire at the New York State Fair. Doubtless 4-H Club members over the State who were showing Ayrshire calves were glad to see him graduate from 4-H Club work.

In the fall of 1936 Ralph went to Cornell to start a 4-year course in agriculture. After graduation he worked as a partner with his father for 2 years and then bought the farm. Ralph has no regrets over his 4 years at college. He says, "I find that college contacts have been a help, not necessarily in dollars and cents, but in my general

outlook and in seeing the other fellow's point of view."

As you might expect in an intensive dairying area, Ralph has been and is improving pastures on his farm. He is putting some fields to orchard grass and ladino and some to birdsfoot and timothy. Also on the farm is a 20-acre field of birdsfoot which is cut for hay.

This is a big farm for any man to operate. Altogether, Ralph is farming about 400 acres of land and has 85 head of purebred Ayrshires. Recently, Ralph was notified that he had won an Ayrshire Constructive Breeder Award, a recognition given to Ayrshire owners on the basis of the herd test average and type classification of the herd. Disease is always a problem for any dairyman and speaking of mastitis Ralph says, "The herd has been under the State mastitis program for 4 years and we have been helped a lot in handling this disease."

Sometimes a young man starting to farm for himself finds he is so busy that he has no time for outside activities. In some way Ralph has found this extra time. He is a member of the Hobart Rotary Club; president of the local Dairy Herd Improvement Association and Artificial Breeders' Association, and a member of the Farm Bureau Executive Committee and Dairy Commodity Committee.

Ralph is still much interested in 4-H Club work. During our conversation he mentioned that he had recently attended a 4-H Club meeting where he showed members how to trim hoofs and clip their calves.

Ralph forsook single blessedness in 1942 when he married Miss Ann Hyde of Syracuse. They have 3 girls, Nola, 7; Susan, 4; and Nancy, 2.

There is no question but that many difficulties face the young man who aims to become a farm owner. But the average age of northeastern farmers is high, and it naturally follows that young men like Ralph Gould must take over and operate many of our farms.—H. L. Cosline

—A.A.—

ARTIFICIAL BREEDING GROWS

During 1949 there was an increase of 18% in the number of U. S. herds using artificial insemination. On last January 1 the number of herds in the program was 372,968, with 2,827,530 cows.

Wisconsin leads the states in number of cows in artificial breeding associations, with New York second. Following are the top states with number of cows: Wisconsin, 411,566; New York, 287,044; Pennsylvania, 233,311; Ohio, 216,117; Iowa, 192,783; Minnesota, 189,332; Michigan, 140,445; Illinois, 135,572; Indiana, 97,391; Kentucky, 70,040; Missouri, 69,042; Louisiana, 59,102; Tennessee, 50,967.

Ralph Gould with Brook Pine Lucky Linda, one of his purebred Ayrshires, who made 96 pounds of fat in March.

Brook Pine Lotus, one of the older cows on the farm, is 15 years old with a lifetime record of 101,315 pounds of milk and 4,162 pounds of fat. She was bred and raised on the farm and comes from a long-lived cow family, her dam having a lifetime record of 98,860 pounds of milk.

LATEST NEWS ABOUT WEED KILLERS

Remember these three words: BUTOXY ETHANOL ESTER. Everybody's talking butoxy ethanol ester—the low volatile, more powerful ester. Kills only where you aim it—vapors do not injure susceptible plants nearby.

WEEDONE BRUSH KILLER 32
Contains the butoxy ethanol ester of 2,4-D and 2,4,5-T. There's absolutely nothing like it. Use it for pastures, fence rows, irrigation ditches and roadsides. It kills over 100 woody plants: brambles, poison ivy, poison oak, certain species of oaks and pines, wild rose, osage orange, willows, wild cherry, hickory, buckbrush, sagebrush, elderberry, coralberry, honeysuckle, etc., as well as thistles, knapweed and other perennial weeds.

WEEDONE CONCENTRATE 48
The world's Number One selective 2,4-D weed killer for use in corn, small grains and other crops. Contains 3 lbs. 2,4-D acid per gallon... the ethyl ester formulation. Consistently more effective than salt formulations in treating perennial weeds and annuals in late stages of growth, during dry weather, and under other adverse conditions.

WEEDAR 64

An amine salt formulation containing 4 lbs. 2,4-D acid per gallon. Completely soluble in water. Will not clog nozzles.

ACP GRASS KILLER (TCA 90%)
A new grass killer, offering effective control of certain noxious grasses in crop land, pastures, irrigation and drainage ditches, roadsides, fence rows and rights-of-way. Also for controlling perennial grasses such as Johnson, quack, Bermuda and para. Lower dosages will suppress both annual and perennial grasses, such as crabgrass, foxtail, chess, bluegrass and red top, leaving a grass cover where desired.

WEEDONE CRABGRASS KILLER
A new non-poisonous crabgrass killer for lawns, parks, pastures and other turf areas. No toxic effect on soil. This important new product will not kill clover, bluegrass, fescue or other deep-rooted perennial grasses.

Just for a Day the Past Lives Again

(Continued from Page 1)

The orthodox Farmers' Institute program provided that following the prayer there should be an "Address of Welcome" and then a "Response by the Conductor." I remember with a passing wave of sadness that I responded many, many times.

But the highlight of the Institute was the evening session. One-day meetings were always three sessions — 10:30 A.M., 1:30 P.M., and 7:30 P.M. Two-day meetings usually omitted the evening session on the second day. The very earliest Institutes as held in 1886-87 were three-day conventions with a total of eight sessions. Invariably, almost from the very beginning and through all the years until the end, there was a "Question Box" at every session except the opening one.

During the day we tried to stick to discussions related to agriculture, but when evening came we frankly considered it time for local entertainment—singing, violin or piano solos, recitations and occasionally a dialogue or little skit. And then came what it was hoped would be the big event of the meeting—the "Evening Talk" (the universal phrase to designate this effort). This was usually given by the conductor or by a special guest, such as Governor Hoard or some other speaker from another state. Generally, the Evening Talk made little pretense of being agricultural. Sometimes it was entertaining and humorous, and in many cases it was almost purely inspirational. The "crews" of three to five workers were made up so that at least one member could take on this particular job.

I have listened to a large number of Evening Talks in my time and I confess to having perpetrated a good many. Two especially stand out in my memory across the years. One was "The Making of a Man" by Edward Van Alstyne, "the Sage of Kinderhook." Van Alstyne was an Elder in the Dutch church, an extensive farmer, a speaker of no small ability, and a very lovable gentleman. His address was a sermon which sent people home better than when they came.

The other Talk of which I am thinking was "Wheel Tracks in the Desert." It was by Joseph E. Wing, an Ohio farmer and author whose frequent contributions to the old Breeders' Gazette were in themselves agricultural classics. In earlier years he had been for two or three years a cowboy on a Utah ranch, and out of this experience he wove an evening tale which I am persuaded was a singularly finished and beautiful lecture. I know that when he ended, it took a long time for the applause to die into silence. Joe was the particular apostle of lime and alfalfa in the years when both of them needed a spokesman. His career was too soon finished. Somehow or other, he died almost before he reached his middle years, but I am thankful that I knew him and his whimsical humor, kindling smile and compelling charm.

The last item of the Farmers' Institute program was "Closing Remarks by the Conductor" — a title often best handled by grafting it on the Evening Talk. And now across the years I can still hear the "Come agains" at the close of the meeting and share in the friendly handshakings. I can see the moving lanterns under the church sheds where the patient horses were blanketed, and I can hear the squeak of sleigh shoes on cold, dry snow and some member of the crew saying rather happily, "Well, write off another one!"

Just for this once I am going to write a bit boastfully concerning "The Old Guard," meaning thereby those of us who assume this title by virtue of the

fact that our connection with the work goes back previous to 1918, the date when the Farmers' Institute work was divorced from the Department of Agriculture at Albany and made a part of the activities of the College of Agriculture at Ithaca. Let me say right here that in the end the change has all been for the best.

I remember a considerable list of these old-time campaigners, and probably there were as many more whom I have forgotten. Among those who were in the work before the turn of the century and whose period of service covered a considerable span of years, I recollect J. S. Woodward, George T. Powell, Edward Van Alstyne, Herbert E. Cook, Daniel P. Witter, Frank Dawley, Frank Converse, Frank Curtis, Frank Ward (a strange coincidence that there should be four "Franks" in this not very lengthy list). Then there was George Smith who came into the work at a very early date and who was for several years Director. John G. (Jack) Curtis belongs in the list of the Old Guard, but was of a little later vintage. I must not for a moment forget James E. Rice, Professor Emeritus in Poultry Husbandry in our State College of Agriculture. Without question he remains our most distinguished member. He has gone very, very far since those barn-storming days, but we are proud to remember that he began his long career in the rough-and-ready school of the Farmers' Institute.

Even in the period 1900-1910, special work for women was not forgotten. I remember the two good ladies who somehow or other acquired the titles of "Sister Wells" and "Sister Judd." Then there was Dr. Lucia Heaton, a physician of Canton whose favorite theme was "The First Year of the Baby's Life." Other pioneer women were Mrs. Ida Harrington, Mrs. Orra Phelps and Mrs. Della Jones. These were not the only women who had a part in the work but they happen to be those whom I best remember.

There was always more or less employment of speakers from outside the state. Some of them became almost regular visitors. Governor Hoard of Wisconsin, John Gould, Alva Agee, Joe Wing, and T. B. Terry, all of Ohio, came not once but several times.

Perhaps it may add a bit of human interest to tell how Frank D. Curtis laid down his work. In the 1890's, he and another old-time worker, William H. G. Gilbert, were holding a dairy school at Cuba in Allegany County. At the close of a busy day, Curtis said that he was all tired out and was going right to bed and see if he could get a good night's rest. Later in the evening, "Gil" looked into his room for a moment and received the cheerful assurance that he was perfectly comfortable and would be all right in the morning. Doubtless he spoke more truly than he knew, for in the morning it appeared that he had died quietly in his sleep in that hotel bedroom in western New York. I believe that is the only instance when any untoward happening marred the peaceful routine and fellowship which was a part of those days.

In the beginning I was hardly more than a boy just out of college thrown into the company of middle-aged or elderly men. Of all the Old Guard, I can think of only four who still linger on the scene. Jimmie Rice writes me now and then from his Florida home. Then there is Orra Phelps who in her eighties has just published a book, "The Martin Box," which is really her girlhood autobiography. I am not quite sure but I think Della Jones is still

(Continued on Page 29)

The Question Box

This past winter I had a lot of water in my cellar. I was advised by a plumber that roots in the drain were causing the trouble and that something should be put in the drain after the cellar had dried up. What would you suggest I put in the drain to kill these roots?

The material which the plumber had in mind for you to put into your sewer to kill out any tree roots which might be growing there is copper sulphate. It comes in large crystals and the usual method is to put a few crystals in the sewer and let them dissolve as the sewer is used, then put in a few more occasionally. The material is comparatively cheap and is quite effective. You should not use too much at a time nor much longer than it is needed, as too much of this isn't too good for the city disposal system.—I. W. Dickerson.

Why is it that so few geese are raised in the Northeast?

Apparently the big reason is that the public is not accustomed to eating goose meat, although in some cities where there is a heavy foreign-born population there is a considerable demand. Because geese eat so much grass, goose meat can be grown at less cost than chickens and it would seem that there is some possibility of creating a demand for the meat.

Until recently, hatching goose eggs in incubators has had its problems and the percentage hatched has been low. However, recent investigations have solved some of these problems, thus removing one handicap.

We plan to purchase a farm but it is covered with wild onion. What can we do to rid the farm of this weed?

The problem of clearing up a farm of wild onion is not too difficult, and today, with our newer chemicals, can be accomplished in two ways. The first method involves the problem of leaving the land fallow without any crop for one year and intensively working on cleaning up the wild onion in any fields where it is serious. However, it is not necessary to do this over the entire farm at one time as it can be done with one or two fields in any given year. Although wild onion does spread, its spread is slow enough so that each field can be handled separately.

If one were to go at it from the standpoint of cleaning up a field or a given number of fields in one year he could then do one of two things: The first method would be to make an application of 2,4-D on the onions early in the spring when most of the bulbs underneath the ground have germinated and when the wild onion plants are 4 to 5 inches tall. This application would kill the onion back to the first

bulb before any new bulblets are formed. However, if this application is delayed until the onions reach a height of about 10 inches or more (which they often do before too late in the spring) then one might better plow or disc up the land and let the onions again germinate and spray at the proper time.

In either method it is necessary to stir up the ground two or three times throughout the summer. This will usually rid a field of wild onion with three well-timed sprays and cultivations in between.

The operation of cleaning up wild onions is based on the fact that 2,4-D will kill the onion tops (when sprayed when they are 3 to 4 inches tall) down to the first bulb, but the 2,4-D will not translocate into the root beyond the first bulb. For this reason it is necessary to wait two or three weeks after spraying to make sure the 2,4-D has gone down to the first bulb, and then recultivate the soil to let the dormant bulb germinate, and then the entire process is repeated. Since wild onion plants have several dormant bulbs, it is necessary to control each one until they are eliminated before new bulblets are formed. In the middle or late summer of a very dry year which is not conducive to bulb germination, it may be necessary to apply one spray in the spring of the second year to be sure that the bulbs are all controlled.

In pastures where one does not wish to destroy the existing seed, wild onion may be controlled over a period of two or three years by applying the sprays early in the spring when the plants are at the proper height but before new bulblets are formed. Usually within two years an approximate 90% control can be obtained if the sprays are properly timed, but an application is usually needed the third year to be sure of cleaning up the fields. If legumes are present in the pasture it is usually necessary either to reseed the legume or wait for a natural stand of clovers to come in if soil conditions are satisfactory to obtain a natural stand of clover.

Although a relatively good kill can be obtained with 1½ pounds of 2,4-D acid per acre I would suggest using 2 pounds of 2,4-D acid-equivalent per acre to make more certain of better kill in each spray.—John VanGeluwe

What's a good way to kill ants in ant hills?

Chlorodane is recommended as one of the best materials to use. If you put one-eighth of a teaspoon of 40 or 50 per cent Chlorodane wettable powder in the center of an ant hill and water it into the hill with a sprinkling can, you should succeed in killing all of the ants.

What is the best age at which to market ducks and what is the common weight?

Young ducks are ready for market at about 12 weeks of age, at which time they will weigh from 5 to 6 pounds.

How much can a dairyman afford to pay for molasses compared to grain?

One rule is that molasses is economical whenever 6½ gallons cost less than a bushel of corn.

How does the composition of well-rotted manure differ from fresh barnyard manure?

There is very little difference in composition. This, however, does not mean that there has been no loss. Losses may run as much as 50%, but it takes around 2 tons of fresh manure to make 1 ton of rotted, which is where the loss occurs.

THREE-POINT LANDING!

Pitchforks can be dangerous, too; Johnson's found that painfully true, Leaped from wagon, fork in hand—Gosh! forks prick to beat the band!

Wonderful!

Dear Sirs:

Have exactly 61 replies to April 1st advertisement.
I think that is wonderful!

— Bernice B. Stanhope
Bunny's African Violets.

Amazing!

Dear Friends:

Have had truly amazing results from my first ads with your magazine. I'll have greater variety and greater quantity next year. Your subscribers are such nice, friendly folks to deal with. I've had some of the nicest letters I've ever read from folks who ordered from those ads.

Please run the enclosed ads in the next edition. I've been too busy filling plant orders to write the ads before this. I've included 50c in my check for my subscription.

—Mrs. Elizabeth W. Buschlen

Please Stop!

Dear Sirs:

Please stop my poultry ad ordered for the April 15th and May 6th issues. We have sold all we can possibly produce and orders are still coming.

— Frank Vainauskas

UNSOLICITED PROOF

The above letters are just samples of many received from hundreds of different people who have used classified ads in *American Agriculturist* in the past 12 months.

There is nothing amazing about *American Agriculturist* Classified ads except the low cost and results. *American Agriculturist* classified ads are the biggest advertising bargain in the Northeast. For 10 cents a word your message goes into

Unexpected Treasures

By James Aldredge

THERE isn't much chance of a farmer today repeating an experience that happened to Marion Cheeseborough in the year 1904. Cheeseborough, a tenant on the old Carr place in Otsego County, New York, plowed into a set of about ninety-six pieces of pre-Revolutionary china.

Before he could stop his horses, his ploughshare had broken twenty-nine pieces, but sixty-seven were in perfect condition. The Burdicks, owners of the place, immediately claimed the china. A lawsuit followed, the result of which was that the Burdicks got the dishes, but they had to make a settlement with Cheeseborough. The china was valued at \$2,500. It had belonged to a pioneer named Carr, who fled to Canada on account of the fear of raiders.

Nowadays people do not hide money about their homes nearly as much as they did only a generation or two ago. When George Brush died near Monticello around the early part of the century, searchers found little wads of money hidden in rubbish and holes around his house and barn. Six years after the miser's death, a tramp who happened to take refuge in his barn found \$200 in coins and bills in an old boot he tried on.

The government did not used to lay claim to uncovered treasure. The rule formerly was "Finders, keepers"—and people had a right to enjoy what they discovered.

A "Safe" Investment

Near Seaford, Delaware, Nathaniel Conway once bought an old safe at an auction. He waited some time before he bothered to open it, but when he did so, he found enough gold to support him in comfort for the rest of his days. He wisely refrained from telling the exact amount of his windfall.

At Pittsburgh, Pennsylvania, Peter Lelbauch lived in an old shanty. Whenever he went to the stores to trade, children ridiculed him and made him the butt of their jokes. They would have been more respectful if they had known how rich he could have made any one of them. When this old, unkempt miser died, more than \$30,000 was found craftily concealed in his lonely hut.

A \$3000 "Jar"

Near Pownal, Vermont, two hunters once sought shelter from a thunderstorm in a cabin where a strange character by the name of William Brown had made his home. The hut was in a sad state of decay by that time. As the hunters waited for the storm to slacken, they poked around among the odds and ends and came upon an old fruit jar in which more than \$3,000 had been hidden.

Richard Magee, who once lived at Stamford, New York, was known to have much wealth. But when he died, his papers and money could not be found. A careful search was made, but nothing was discovered. As a last resort, the executor had to have papers known to exist duplicated. In response to a request from one of the relatives, the house was once more ransacked, and, sure enough, in a little hole in the garret, \$9,000 in valuables was found.

At one time one of the richest residents of Matteawan village (now part of the city of Beacon, New York) was William P. Badeau. When he died, he left an estate of about \$500,000. It was not all discovered at once, however. He had been dead several weeks when somebody who happened to go into the cellar of his home found an old

MONEY FOR YOU

Perhaps you have heard your grandmother tell how her grandfather—or perhaps it was a neighbor—found an unexpected treasure. It might even be that you were the lucky person. For every true story of a find like the ones James Aldredge reports, which we are able to print in *American Agriculturist*, we will pay \$3.00. Here's your chance to get an unexpected check!

Keep them short and send them soon to *American Agriculturist*, Savings Bank Bldg., Ithaca, N. Y.

chest in which he had hidden more than \$40,000, mostly in gold and some in currency.

Stocks That Paid

Sometimes the owners of a fortune do not know it. Out in San Francisco, an elderly woman made a pleasant discovery. Back in 1882 she had bought sixty shares of Bell Telephone stock and took it for granted she had been swindled. Then an agent happened to call one day and revealed what a handsome bonanza she possessed.

Another time, when a certain estate was distributed in the late seventies, some bonds that were thought to be without value were not turned over. Years passed, and then one day the widow, who was in straitened circumstances, told her lawyer about them. There came a sudden change in her fortunes. Over \$800,000 in principal and accrued interest had to be distributed through the probate court of San Francisco!

Strange "Windfall"

About the strangest windfall that ever came to campers happened near Lake Washington, Minnesota. One night a group of men dragged a cedar log to their camp-fire. A wooden plug aroused their curiosity, and so they split the log more carefully than usual. It was a good thing they did so. More than \$600 in gold, \$68 in silver and \$500 in bills was found in this queerest of all caches. It goes to show that in olden times, when misers did not have the confidence in banks they have today, there was no telling where they would hide their savings.

—A. A.—

VERMONT TOBACCO

FROM a correspondent outside the state comes inquiry to Vermont Department of Agriculture as to history of tobacco growing in Vermont and whether there is any move toward its resuscitation. Source information is not at hand. This writer knows from observation that around 30 to 35 years ago many farms along Connecticut River in Windham County grew considerable acreages of cigar leaf tobacco. There was a big shadegrown acreage at Westminster. In recent years, no more than one or two farms in the state have grown it, commercially at least. Why the decline, I do not know; but if memory serves correctly, the practice went out in Vermont at same time many of the more numerous and larger growers down the valley in Massachusetts and Connecticut gave up raising tobacco and went into potatoes. Was that about the time, too, that the government was paying folks for not raising whatever they may have been raising? We should be glad of any information. Incidentally, we have heard of no move toward taking up the crop again.—Harold L. Bailey

FIRE PROTECTION

Are You Interested?

By E. W. FOSS

GOVERNOR DEWEY has recently signed into law a bill which in brief enables every county in New York state to provide better fire protection for its inhabitants. This bill does not require but gives the county commissioners authority (if they desire) to provide the services of a county fire coordinator and to sponsor a fire advisory board. Through this board and coordinator the bill enables you as a private citizen to secure better fire protection in the rural areas by permitting and encouraging county, town, and municipal cooperation. Just what are the possibilities?

1st. Have you ever heard of fires that kept on burning because phone calls did not get through or assistance from other towns was delayed?

Better systems of communication and the securing of mutual aid assistance agreements between neighboring fire departments can be had—if you will encourage it.

2nd. Do you know of fires that kept burning because there was too little water?

Many fire departments operating away from hydrant areas now have tank trucks to take care of this difficulty, while in countless other instances the farmer, often in cooperation with the Soil Conservation Service, has provided water holes, farm ponds or cisterns for fire protection and other uses. You can help to secure this water.

3rd. Has there been a fire in your neighborhood that could have been prevented?

An inspection of your property can reveal many fire hazards. Fire companies as well as insurance companies may provide inspection service—for your good as well as theirs. Welcome this service if it is provided, but meanwhile don't wait. You know of the lightning rod cable that got broken last summer, the loose brick in the chimney next to the wooden girder, and the pile of rubbish in the cellar next to the furnace. Let's do something about it.

4th. Do you know of a fire that might have been put out if you only had — what?

A handful of baking soda next to the stove to put out the fire in the frying pan or oil stove; a quart pump type fire extinguisher loaded with carbon tetrachloride that would have put out the fire in the carburetor on that truck filled with hay in the barn. A running water system with two sill cocks at every building and a length of hose to put out the grass fire that started—well, how did it get started?

5th. Was there a fire last year in your community that needed just one more piece of equipment than your town fire department possessed?

How much support have you given your department, either at town meeting, at the street corner, or with your

volunteer help? Many town departments are not only ready and waiting, but are going out on their own and surveying each residence to determine where the well is, how much water it has, where the electric entrance is, and filing all this information on cards placed at the truck for use when needed. Have you helped?

6th. What did your last fire insurance premium cost you?

You could cut that down appreciably by securing the services mentioned here. The State of Iowa cut their farm losses in half by farm inspections alone during a two year period before the war. Northeastern farmers and rural residents are as progressive as those in Iowa, so let's support this latest public law by talking about it, encouraging your fire department, and by being fire conscious.

— A. A. —

Picture Honors Nation's Land Grant Colleges

NASHVILLE, North Carolina, a little farming community of 1,500 was host May 22 to some of the nation's top government and agricultural leaders at the world premiere of a new movie honoring the country's 52 land grant colleges.

"Waves of Green," the technicolor picture produced by Dearborn Motors Corporation of Detroit, tells the story

Saddening to all guests at the Nashville premiere was the news on May 25th that Frank R. Pierce, president of Dearborn Motors, succumbed to injuries received in a plane crash the day before. Five others, including Mrs. Pierce, were injured in the crash of the company-owned plane at the Charlotte, N. C., airport.

of contributions to agriculture made by scientists of land grant colleges working with farmers to bring us the standard of living we have today. Some of the achievements dramatized in the

40-minute movie were: the rescue of the wheat crop from ravages of wheat rust; the development by Dr. F. R. Beaudette of the New Jersey College of Agriculture of a vaccine to halt Newcastle disease which threatened the flocks of the nation; and the development of crops suited to today's mechanized farming.

About 200 of the visitors were guests of Dearborn Motors on a special train from Washington to Nashville and return. Included were 48 members of Congress, representatives of several foreign countries, officials of the U.S.D.A. headed by Secretary of Agriculture Charles F. Brannan, other agricultural leaders and about 50 newsmen. From a viewing stand the special guests witnessed a 60-float parade depicting the advances North Carolina has made in agriculture in recent years. With hybrid corn, heat-resistant pasture crops and acreage controls governing cotton plantings, more and more North Carolinians are getting into dairying and beef and hog raising.

In addressing the crowd of 16,000 attracted by the parade and preview, Secretary Brannan made a plea for the controversial "Brannan Plan" without mentioning it directly. He said the nation's farm program should be revised to maintain high farm purchasing power, encourage production of foods that are most wanted—and encourage their increased consumption by keeping market prices "within easy reach of consumers."

Following the world premiere at Nashville, the picture was released for state premieres at land grant colleges across the nation.

PAVED BARNYARDS

IF ANYONE has ever found a good use for mud, we can't think of it right now. We used to think mud was good for pigs to wallow in, but now we know that even pigs prefer to keep their water and dirt separate.

Certainly a muddy barnyard is a handicap. It brings conditions that tend toward infected feet. There is a probability that cows that drag their udders through mud are more likely to get mastitis and, once they are in the barn, one of two things happen: either you spend a lot of time cleaning the cows or you send dirty milk to market.

More and more dairymen are paving their barnyards with concrete. Briefly, this is done by cleaning the barnyard of manure and other debris and seeing that drainage is adequate either by putting in tile drains or filling with stone, gravel or cinders and then laying a concrete floor.

It is recommended that a paved barnyard of 40 square feet per cow be provided, that the concrete should be 4 inches thick or 6 inches if heavy loads are to be drawn over it. The Portland Cement Association, 20 Providence Street, Boston 16, Mass., has some excellent information which you will appreciate having before you actually start paving your barnyard.

PERCENTAGE OF FARMS USING ELECTRICITY

This map by Edison Electric Institute shows the percentage of farms using electricity as of January 1, 1950. The black areas indicate that over 90 per cent of the farms in those states have electricity and that rural electrification is practically completed there. The states with the checkerboard effect have from 80 to 90 per cent of the farms electrified; those crosshatched both ways, 60 to 80 per cent, and those crosshatched one way, 40 to 60 per cent.

It Sure Pays to Feed Farm Animals SALT PLUS!

— Say Farmers Everywhere

Here's What STERLING BLUSALT Gives Them!

SALT... the most important mineral of them all.
COBALT... lack of cobalt causes loss of appetite and stunted growth of animals.
IODINE... regulates functions of thyroid gland and its secretion.
MANGANESE... helps prevent sterility... improves lactation.
IRON... essential for healthy red blood... helps prevent anemia.
COPPER... essential to convert iron into red blood cells.

Say you saw it in **AMERICAN AGRICULTURIST**

JOHN MOUL is shown checking the flow of grain through one of the automatic feed conveyors on the Moul's Poultry Farm, Inc., in New Hampshire. Plans for a new 5-deck building call for 30 automatic feeders.

New Hampshire Poultryman Likes Automatic Feeders

By **CHARLES L. STRATTON**

AUTOMATIC feeders are here to stay according to John Moul of Exeter, Rockingham County, New Hampshire. This poultryman doesn't have any birds of his own but he gets plenty of experience on his brother Melvin's poultry farm in Brentwood. This farm, known as Moul's Poultry Farm, Inc., and owned by Melvin and his son, Morris, has one of the world's largest brooder units and is now rapidly advancing toward its next goal—that of owning the world's largest henhouse.

The triple deck, 300-foot brooder house was completed about a year ago. It was pretty well filled up with birds the day John showed me around. The ground floor was divided into two 48 by 140-foot pens by a 20 foot grain room in the center.

Easy Feeding

Stepping inside one of the large pens, John explained that the ground floor was at present being used for housing the layers. Some 2,000 birds were in this single pen. They didn't seem the least bit scared. In fact most of them were busy feeding out of the long rectangle formed by the automatic feeder trough running completely around the pen. This was only one of the six feeders of this type used on the farm.

John said the birds were mated up at the rate of 8 "Rock" roosters to every 100 pullets. "Feeding is no trouble at all," he said. "We simply dump four bags of mash a day in the hopper, and that takes care of everything. The hopper is right next to the grain room so there is hardly any lugging of grain or time wasted during feeding. Grain isn't lost or spilled over like in the ordinary type feeders, and above all it keeps the birds interested . . . and eating."

He checks up on the feeders a couple times a day to make sure everything is running smoothly but that only takes a few minutes compared to what it would be if he were feeding by hand.

All three floors are radiant heated. The actual brooding units are on the upper two floors which hold about 6,000 broilers each. Due to the heat from the upper floors it was found the only extra heat needed for the ground floor was an oil stove in the grain room.

Still Growing

Day old chicks for the broiler industry is the main business. The hatchery, located a short distance from the farm, contains six streamlined incubators with a weekly output of around 60,000 day old chicks. John's main work is

culling. He divides all stock into three grades and says even a minor detail like an off-color feather will drop a bird down to second place.

Last fall there were 20,000 birds on the range with breeding scheduled to start in November. But the way John tells it, future plans call for a year round breeding program with no let-up. The breeding stock will then total approximately 50,000 birds.

This, of course, all depends on their new 600 foot, five decker henhouse. The first 300-foot unit was completed and put to use last fall. Estimated capacity will be around 50,000 breeders when completely finished. Fifteen automatic feeders will be used on each side, making a total of thirty feeders in the entire building.

This monstrous henhouse will not be completed this year, but when it is, it will be no more spectacular than the fact that 25 years ago Melvin Moul was a factory worker with a small henhouse and a sideline of 500 birds.

New Discovery Hastens Growth of Chickens

SOME of the most startling research done in recent months has been with certain subjects called "antibiotics" among which are aureomycin and streptomycin. Originally these substances combatted certain diseases which previously had been difficult to treat. Now research men, working for feed companies, state experiment stations, and the U. S. Department of Agriculture at Beltsville, Maryland, are on the track of important developments in the use of aureomycin and streptomycin in animal feeds.

It has been found that the addition of aureomycin and streptomycin to the usual rations for chickens will result in more rapid weight gains. Similar results come from the addition of Vitamin B-12, but experimentally the fastest gains have been secured when one of the antibiotics and Vitamin B-12 are both used along with certain other chemicals. One theory for the increased gains is that these antibiotics kill harmful organisms in the bird's digestive tract, thus leaving the field open for the growth of beneficial organisms.

At Beltsville, Maryland, a formula now being tested on chickens contains soybean meal plus aureomycin, Vitamin B-12, arsenic acid, folic acid, ascorbic acid (Vitamin C) and methionine, a protein substance which is

scanty in vegetable proteins. These are big words but you may need to become accustomed to them or more likely with their trade names when they are recommended for use by poultrymen.

The results so far show that chickens on this diet weighed 1.26 pounds in 6 weeks, while others fed without these trimmings weighed .85 pounds. It is interesting to know, also, that the gains were made economically. Those on the experimental diet gained a pound for each 2.25 pounds of feed, while the control birds on the regular ration gained only 1 pound for every 4 pounds of feed.

So far the tests have been made on Rhode Island Reds. Turkeys will be tried this summer, as well as hogs.

Some of the developments being reported by research men put to shame the claims made by the old patent medicine vendors. The only difference is that research men stick to facts. As yet, this new development is in the experimental stage and is not being used commercially.

— A. A. —

VACCINATION

Dr. Levine of Cornell says if you are going to vaccinate a flock of pullets for Newcastle, bronchitis and fowl pox, start with the first one at five weeks, the second at eight weeks, and the last at twelve to fourteen weeks. If you have birds of different ages, you can vaccinate one group of birds with Newcastle and the other with fowl pox vaccine at the same time, provided they are kept in separate buildings and proper precautions are taken to avoid the spread of the disease. There is not much danger of spreading these diseases. This does not apply to Bronchitis inoculation, which is highly infectious. It is not recommended that any one group of birds be given two different vaccines at the same time.—L. M. Hurd

— A. A. —

CHARCOAL IN CHICK RATIONS

California tests showed that when 2 percent charcoal was added to chicks' ration, their growth was not too good; 3 out of every 4 chicks in the lot had Vitamin A deficiency; blood clotting time was increased to more than 30 minutes because of lack of Vitamin K; and all chicks had eroded gizzard linings. Some had 'curled-toe paralysis', a lack of Vitamin G.

In the control lot, chicks were fed the same ration but no charcoal; growth was good, there were no cases of Vitamin A deficiency, blood clotting time was only 24 minutes, and gizzard linings were normal.—L. M. Hurd.

TOO LATE

Eddie had a broken ladder.
Meant to fix it, yes indeed.
But he used it once too often . . .
Hence on crutches he'll proceed.

—Graham Hunter

Did you VOTE today?

EVERY TIME you give expression to your views about government matters you are, in a sense, "voting"...especially when (as is your duty) you make your opinion known to your government representatives.

One of the most important matters on which you can express your opinion is the streamlining of government to cut down overlapping and expense and increase efficiency—as recommended by the Hoover Commission on organization of the federal government.

The recommendations of this impartial bipartisan study would save billions yearly, and *strengthen the country*. Democrats and Republicans alike, when they study and support the Hoover Report, are voting for "better government at a better price."

Turkeys for His Neighbors' Tables

WHEN a city man goes on a farm, most of his neighbors assume that he is doomed to failure. If the neighbors of William Rejaunier of Washington, New Jersey, had any such ideas they were badly fooled.

Back in 1940, Mr. Rejaunier, who had been a salesman, decided to move to the country. He looked the field over carefully and decided turkey raising offered some real opportunities. Now he has 800 breeders and raises and sells 3,000 birds annually plus thousands of baby turks from his 7,600-egg incubator.

These White Hollands are all raised on wire, and as soon as the poults are two or three weeks old they are allowed to go from the brooder to one of these wire porches. Half way up a bank as you drive into the yard, you will find three rows of elevated pens, with wire floors, most of them 20x20 feet. Around the sides of the pens are metal feeders, and at the end is a water pail set half in and half out of the pen so that the water can be changed easily. Each pen accommodates 66 full-grown turkeys.

Most of these turkeys are sold locally, many of them to consumers who come to the farm, others to hotels and restaurants. The farm has a quick freezer which can store birds not sold immediately.

Every detail on the Rejaunier turkey farm has been worked out to save time and to avoid losses. Says Mr. Rejaunier, "I believe that 95% of the disease difficulties of raising turkeys can be avoided by eliminating worms and the rest of the trouble of segregating sick birds and killing them if they do not recover quickly."

The success of the enterprise indicates that a careful study of the factors involved is more important than the previous occupation of the boss.

—A. A.—

HINTS ON POULTRY RANGE MANAGEMENT

Many poultry farmers have not taken care of ranges in such a manner as to make them an asset. Early in the season it may be necessary to mow productive ranges as often as every week or ten days. This serves to keep obnoxious growth down and provide an abundance of succulent green feed. Economy-wise poultrymen feel that such succulent green food is at least one factor that will help reduce the cost of growing replacement stock.

Another phase of range management is the judgment of poultrymen in putting the ideal number of birds to the acre. This depends upon soil type. In cases of good sandy loam it is ideal to place about 400-500 birds per acre and for heavier and lighter soils a corresponding increase or decrease in the number per acre.

Included in the problem of range management should be a system of culling. Perhaps about as good a suggestion as any is to carry a catching hook at all times to catch any birds

that appear undesirable. Such a plan may prevent the spread of disease and will undoubtedly reduce the feed bill. Using such a system will provide the best possible pullets for housing.

In addition, it is necessary to take pullets off the range and place them in the laying house at the right time. A good general rule is that pullets should be moved to the laying quarters before they attain 5 per cent production.

—H. W. Hickish

The Poultryman's Question Box

Would the eggs produced by a flock of hens after an attack of Newcastle be Grade A eggs? The dealer to whom I send my eggs had an egg inspector at his store who said that my eggs could not be sold as top quality eggs.

The egg inspector was partly right and partly wrong. It is true that when a flock of hens is hit by Newcastle disease all of them, as a rule, quit laying for a period of from one to perhaps three weeks, and then practically all of them go back to laying as well as before, sometimes even better. It is also true that the quality of eggs laid by some of the hens (but not all) after they resume production is not grade "A". The whites of these low grade eggs are thin and watery and the shells may be rough and occasionally thin and misshapen. But after a while many of these hens again lay eggs of normal higher quality. They have regained their ability to secrete thick albumen. Some hens, however, never regain that ability and therefore will always lay eggs of "B" grade or lower.

—L. E. Weaver

—A. A.—

A FORUM FOR BACKYARD GARDENERS

(Continued from Page 9)

glect thinning; it pays off in quality products. Half the fun of growing a garden is to have your non-gardening friends comment admiringly on your results. Of course you know they always think that it takes practically no work to grow a garden.

New Lawn

This is a good time to think about that new lawn. The best time to sow the seed is along the last of August. From now until late August the ground will be too hot and dry to grow young grass satisfactorily. In the meantime get the plot plowed, keep the weeds down, and gradually grade the area as you work it. This gradual grading will make it less likely that you'll have low spots after it settles. Ask your State College for a bulletin on lawn-making, or if you have questions on this or any other backyard gardening subject, we'll be glad to hear from you. Just write to The A. A. Gardener, *American Agriculturist*, Box 367-G, Ithaca, New York.—The A. A. Gardener

Don't Let Worms Lower Your

Wonderful Success Raising Baby Chicks

Mrs. Rhoades' letter will be of utmost interest to poultry raisers. Read her experience: "Dear Sir: I think I must be one of the very first to use Walko Tablets. Some 35 years ago when I started raising chicks I saw Walko Tablets advertised as an aid in preventing the spread of disease through contaminated drinking water. I tried a package for my baby chicks with happiest results. I have depended upon Walko Tablets ever since." Mrs. Ethel Rhoades, Shenandoah, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct post-paid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

FRANKLIN braided rug thread. Strong! Buy direct! Eight ounces, black, \$1.65; natural, \$1.50. Cash prepaid. Advise whether for lacing or sewing rugs. Suffolk Thread Co., Inc., 67 Chauncy Street, Boston, Massachusetts.

POULTRY picker, Greenbrier, 23 in., good condition. M. Halladay, Groton, New York.

MAKE MORE \$\$\$. Save more \$\$ with Grange Silo's 4 point profit plan. You reduce feed costs, turn grass into cash, save time and labor, increase milk yield. It's Grange for cost-free maintenance. More for your money. Write for full particulars. No obligation. Grange Silo Co., 1002 Main St., Red Creek, New York.

WHY SUFFER from summer heat? Air conditioning is no longer expensive as we guarantee that for \$2 you can make and install in one hour a simple device which will completely cool your home. No expensive or complicated equipment needed. No difficult alterations of house. Absolutely guaranteed to ventilate and cool your home. Send only \$2. 1817 West 66, Los Angeles, California.

DOWN THE

By J. F. ("Doc") ROBERTS

RECENTLY I went into one of our city general stores where they sell everything from chewing tobacco to airplanes. It was six or seven stories high with moving stairways and all that goes with it.

Just naturally I drifted into their meat department, where it looked as if there were five acres of counters surrounded by people three deep, particularly at the fresh meat counters. It looked like the beer concession at a political picnic except that the customers were mostly women.

There were meats of every type and description, yet not a piece that would weigh over 2 or 3 pounds. White-coated women presided over the counters, and there was not a sign of a saw, butcher's block, or sawdust to remind you that you were about to buy some meat. The way this meat was being sold, it could have been ribbons or "40 white thread."

A Long Trip

All this is not new to any of us, but what a long way it is from the animal we load on a truck as it leaves our farm! Briefly, this is what it has gone through: livestock dealer's profit and costs, or our own trucking costs to market; commission for having it sold; the amount the commission buyer receives for buying it; trucking costs to the slaughter house; killing costs; refrigeration and sales costs; delivery costs; cutting-up costs; waste; display cost; sales cost again—to say nothing of government inspection costs. And all this before it even gets to the consumer!

Is it any wonder meat is high? It has been figured out that it costs about 50 cents a pound just to handle a pound of sirloin steak over and above what the original owner received for the animal from which it came.

These handling costs have gone up so fast with increases in costs of labor, transportation, rents, and every cost of doing business, that the livestock farmer is also caught in the squeeze.

Most other types of farming cannot overcome these increased handling costs except with production increases through higher yields. The livestock farmer today has this important advantage: never before, in my memory, has he been able to get approximately 20 cents a pound at the farm for every pound of weight he can put on his animals, and today this applies to every type and kind of good animal on any farm.

The squeeze in livestock then can be

overcome, for there is no animal and no livestock feeding operation which costs 20 cents a pound to put on a pound of gain either by growth or for flesh and fat.

Keep Them Gaining

The lesson then is simple: keep your animals gaining in weight. When they stop gaining, it's time to move them. This means you must carry young livestock whether you are a dairyman or a livestock producer. This is, of course not possible for every cow in high milk production, but her calf can be doing her gaining for her, and her older heifers and bulls also. When her time comes, she can be marketed in flesh with weight.

Our meat-eating habits are also changing. People have proved they will eat meat if they have the money, and they also seem to be proving that they don't care much what it is, or else they just don't know what good meat is. Never before, not even during the war, has there been a time when all classes of all kinds of livestock were selling so close together. There are only a few pennies between the cost of good steer beef and cow meat, between sow meat and straight hogs, or between little calves and choice veal.

Someone at the Yards said the other day that if this keeps up, it won't be long before meat will be selling for just "so much a pound regardless of kind, cut, or what from."

All this has a meaning for every farmer: no matter what your animal may be, it warrants care, feed, attention, and a good home, all of which only you can give him.

— A. A. —

MORE FAMILY LIVING FROM THE FARM

(Continued from Page 8)

grading of the American diet through the strengthening of our animal agriculture. Where can this be carried out more effectively and to greater advantage than right on the farm through the production of pork, beef, mutton, poultry, eggs, and milk for home consumption?

During the war years, the home garden reached a peak in importance in its contribution to family living. Since that time there has been a tendency to shift back, yet the garden probably produces more food per hour of labor than any other enterprise on the farm. Labor represents a large part of the cost of purchased food. Therefore, a garden, efficiently managed, is probably more profitable than ever. Add to this the satisfaction and the nutritional advantage of having fresh vegetables at hand whenever they are wanted, and the argument for the home garden is doubly sound. Garden labor can be reduced by locating the plot for convenience and by planting for tractor cultivation as far as is practical.

It would hardly be practical in this

day and age to attempt to return to the almost complete self-subsistence of our ancestors. Rather, it appears that the farm family of today will do well to examine its needs, then produce for home consumption those items that are best adapted from the standpoint of existing facilities, labor requirement, nutrition, and personal likes and dislikes.

— A. A. —

FREIGHT ON COW FEED

Much of the increase in price which northeastern dairymen pay for dairy and poultry feeds does not go back to the mid-western farmers, but represents an increase in transportation costs. For example, as recently as 1940-41 a dairy ration which cost \$35.00 in the Northeast, represented \$21.00 to the mid-western producer, and the remaining \$14.00 went to pay transportation and other costs.

In contrast, in 1940-49 the ration which cost \$74.00 in the Northeast returned \$44.00 to the producer, leaving a spread of \$30.00.

One way that northeastern dairymen have been meeting the situation is to grow more grain at home and to produce better pastures and hay, so that less concentrates are required.

A Visit With the Editor

(Continued from Page 13)

after working all summer in the hot kitchen putting up berries and preserves of various kinds to feed her family in the winter, would with great pride and pleasure take her neighbors and friends down into the cellar to show them the long rows of canned stuff which she had preserved with her own hands.

Some time ago a farm woman wrote me about the things she appreciated most. "These things I love," she said:

"The sound and sight of wild geese in a snakelike line against a dull November sky.

"Roaring fires in stoves and fireplaces.

"The distant sound of a woodsman's ax."

Another woman wrote:

"I love the awakening of spring, heralded by the bluebirds, robins, and whippoorwills.

"I love the green tips of buds and leaves, the pure white, fragrant blossoms of the syringa.

"I love to watch my winter window plants revealing new growth and beauty."

Still another woman wrote:

"I love the long, low western hill guarding the home spot, the hill over which winds the long white road where people come to us, bright in the morning sunlight, dark under the storm cloud's shadow, or pale and peaceful under the evening star. Through this star as a child I saw the lost baby brother I had never seen; through it an answer could come to the long, long thoughts of youth; through it, when old age comes, I shall look to 'that still land beyond the evening star.'"

—E. R. Eastman

"Oh, Don't mind me — I'm just gonna shave!"

255th Earlville Sale

125 REGISTERED HOLSTEIN CATTLE
WEDNESDAY, JULY 5

Sale Pavilion, EARLVILLE, MADISON CO., N. Y.
T. B. Accredited, blood tested, calfhood vaccinated, many eligible for shipment anywhere.

—90 Fresh and Close Springers
—15 Bred and Open Heifers
—20 Service Age Bulls from 100 lb. to 1200 lb. fat record dams.

Hundreds have bought with satisfaction at these famous, oldest established Registered Holstein Cattle sales.

Every animal sold to be as represented. Sale starts at 10:00 A.M., dinner at noon.

Bring on the Berries!

BERRIES offer grand variety in flavor, color, and texture. Good as they are just as berries, there is practically no limit to the ways they may be used to jazz up desserts.

STRAWBERRY FLUFF

- 1 quart strawberries, hulled
- 1 cup sugar
- 3 tablespoons tapioca
- 1/8 teaspoon salt
- 1 egg white, stiffly beaten

Add $\frac{3}{4}$ cup of the sugar to $\frac{1}{2}$ quart of the berries. Let stand 15 minutes; then crush the berries. Measure juice and pour into upper part of double boiler together with enough water to get $2\frac{1}{2}$ cups of liquid. Cook for 15 minutes or until tapioca is clear; stir frequently; cool.

Reserve enough choice berries for garnishing; cut the remainder of the berries in halves; sprinkle with remaining $\frac{1}{4}$ cup of sugar. When tapioca mixture is cool, fold in beaten egg white and halved berries. Garnish with whipped cream and whole berries. Serves 6.

FRESH BLUEBERRY COBBLER

- 2 cups blueberries mixed with $\frac{1}{2}$ cup sugar
- $\frac{1}{4}$ cup shortening
- $\frac{1}{2}$ cup sugar
- 1 cup cake flour
- $\frac{1}{4}$ cup milk
- $\frac{1}{2}$ teaspoon vanilla or almond extract
- 1 teaspoon baking powder
- $\frac{1}{8}$ teaspoon salt
- 1 egg

Cover bottom of greased baking dish with fruit mixture. Cream shortening. Add sugar and mix well. Add beaten egg. Mix sifted flour with baking powder and salt. Add alternately with milk to first mixture. Add flavoring and beat mixture until smooth. Pour this cake batter over the fruit in baking dish. Bake in moderate oven, 350 degrees F., 25 to 30 minutes. Serve with lemon sauce. For emergencies one package of vanilla cake mix could be used on top of sweetened blueberries instead of the cake recipe. Serves 4.

LEMON SAUCE

Mix $\frac{1}{2}$ cup sugar, 1 tablespoon cornstarch and $\frac{1}{8}$ teaspoon salt. Add 1 cup

boiling water, bring to boiling point, stirring constantly. Cook over boiling water about 15 minutes, then remove from fire, add slightly beaten egg yolk, 3 tablespoons lemon juice and 2 tablespoons butter. Serve hot.

QUICK BLUEBERRY PUDDING

Blackberries, huckleberries, black raspberries, youngberries, dewberries, or boysenberries can be substituted for the blueberries given in this recipe.

- 1 quart blueberries
- 1 cup sugar
- $\frac{1}{2}$ cup water
- $\frac{1}{2}$ teaspoon salt
- 2 cups soft bread crumbs
- 2 tablespoons melted butter
- 1 tablespoon lemon juice if desired

Pick over the berries, wash, drain, mix with sugar, water, and salt, and boil for 5 minutes. Combine bread crumbs and butter; add to hot fruit; stir until well mixed, and let stand on back of stove for about 30 minutes—but do not let pudding cook. Add lemon juice and serve pudding while still warm with plain or whipped cream. Serves 6.

The same varieties of berries may be used in the following:

FRUIT WHIP SAUCE

- 1 cup fresh berries
- 1 scant cup sugar
- $\frac{1}{16}$ teaspoon salt
- 1 egg white
- 1 teaspoon or more lemon juice

Place all ingredients in a deep bowl and beat until fluffy and well blended. Taste and add more lemon juice if desired. The sauce is especially delicious over plain cake, angel food, or sponge cake. Serves 4.

ELDERBERRY PIE

For a treat available to most country dwellers, elderberries still may be found in many woods and hedges. Using sour cream is distinctive instead of the usual lemon juice.

- 2 tablespoons flour
- $\frac{3}{4}$ cup sugar
- 3 cups elderberries, cleaned, stemmed
- 1 cup sour cream
- 1 recipe plain pastry

Mix flour and sugar together; combine with elderberries and sour cream. Pour into unbaked pastry shell; adjust top crust; seal edges; make several slashes in top to allow steam to escape. Brush crust with sour cream; bake in very hot oven (450 degrees F.) 10 minutes; reduce heat to 350 degrees F. and cook 30 minutes longer. Yield: 1 9-inch pie.

Cool and refreshing are the following pies:

STRAWBERRY PIE

CRUMB CRUST

- 4 cups cornflakes
- $\frac{1}{4}$ cup sugar
- 1 tablespoon flour
- $\frac{1}{3}$ cup melted butter

Crush cereal very fine to obtain 1 cup crumbs. Add sugar and flour. Mix in melted butter thoroughly. Press mixture evenly into an 8-inch pie pan, making the bottom slightly thicker than the sides. Bake in moderate oven, 350 to 375 degrees, 7 to 10 minutes. This crust will harden while it cools. Cool before adding cooked filling. Yield: One 8-inch pie crust.

Note: 3 cups of bran flakes, wheat

flakes or oven-popped rice cereal may be used in place of the cornflakes.

FILLING

- 1 egg white
- 1 cup sugar
- $\frac{1}{4}$ cup water
- $\frac{1}{2}$ teaspoon cream of tartar
- $\frac{1}{8}$ teaspoon salt
- 1 teaspoon vanilla
- $\frac{1}{2}$ cups drained, sliced strawberries

Place unbeaten egg white, sugar, salt and cream of tartar in double boiler. Cook over boiling water, beating constantly, until mixture thickens and forms peaks, about 7 minutes. Remove from heat, add vanilla and continue beating until cool. Arrange sliced strawberries in cereal crumb crust. Pour filling over fruit. Garnish with

Cereal crumb crust makes preparation easy for this delectable strawberry pie. The idea is equally good for other berries!

whole berries. Chill one hour before serving. Yield: 1 8-inch pie.

GOOSEBERRY CHIFFON PIE

- 1 tablespoon gelatin
- $\frac{1}{4}$ cup orange juice
- 2 cups gooseberries
- 3 eggs, separated
- $\frac{1}{2}$ cup heavy cream
- 1 cup sugar
- $\frac{1}{4}$ teaspoon salt
- 1 tablespoon lime or lemon juice
- 1 baked pastry shell
- Few drops green coloring if desired

Soften gelatin in orange juice. Cover gooseberries with water; simmer covered 4 to 5 minutes or until just soft. Sieve; there should be $\frac{3}{4}$ cup of puree. Beat egg yolks until thick and lemon-colored; add $\frac{3}{4}$ cup of sugar; blend well. Cook over hot water until sugar dissolves and mixture thickens slightly, about 5 minutes. Remove from heat. Add softened gelatin and stir until dissolved. Add gooseberry puree and lime or lemon juice and mix well. If a more definite green is desired add a few drops green fruit coloring.

Cool and refrigerate until slightly thickened; beat until light and airy. Beat egg whites until stiff but not dry; add remaining sugar gradually. Fold carefully into gelatin mixture and turn

into baked pastry shell. Refrigerate until firm, 1 hour or more. Just before serving spread a thin layer of whipped cream over the top. Makes 1 9-inch pie.

Berry beverages and cookies or sponge cake make easy refreshments:

BLACKBERRY SHRUB

- 4 quarts berries
- 2 quarts cider vinegar
- Sugar

Crush 2 quarts berries; pour vinegar over them; let stand 2 days. Strain off juice; pour it over 2 quarts of freshly crushed berries. Let stand 2 days. Strain and measure. For each pint of juice use 1 pint of sugar. Boil 5 minutes; skim and seal. To serve, add 2 tablespoons of juice to each glass of ice water.

FRUIT SHERBET

- 6 $\frac{1}{2}$ cups whole milk
- 3 cups fruit and fruit juice
- 5 cups sugar
- 4 tablespoons gelatin
- 1 $\frac{1}{2}$ teaspoons lemon juice or powdered citric acid

Mix dry sugar and gelatin. Combine with milk. Add enough water to bring bulk to 6 $\frac{1}{2}$ pints. Heat mixture to 170°F. (not quite to simmering) and cool to 40° F. If possible to hold overnight at this temperature the cream will be much smoother. If not possible, it should be cooled to 40°F. before freezing. Add fruit and fruit juice; this might wait until the mixture is frozen mushy. Continue freezing until firm.

Remove dasher, scrape down mixture from sides of can, and pack in

ice and salt. Hold 3 or 4 hours. Makes about 3 quarts.

Strawberries, loganberries, raspberries or cranberries may be used (also, pineapple, peach, cherry, grape or orange combined with lemon). The crushed pulp is included except where it may prove harsh or unpleasing. A potato ricer is a big help in preparing the fruit.

STRAWBERRY DELIGHT

- 2 cups milk
- $\frac{1}{4}$ teaspoon salt
- $\frac{1}{2}$ cup sugar
- 2 cups cooked rice
- 2 cups fresh strawberries, halved

Place rice in the top part of a double boiler with the milk, salt and sugar. Cook for one-half hour. Chill. When serving, top with whipped cream and strawberries. Any other berries or other fruit may be used, such as raspberries, sliced peaches, pineapple, raisins, dates, figs and apricots.

For the two cups of cooked rice, wash $\frac{3}{4}$ cup of rice well, add to 4 cups of boiling water and cook 20 minutes.

— A. A. —

Strawberries should be washed before the caps are removed.

DREAMER

By Eleanor Alletta Chaffee

She never saw dust,
She never saw dirt;
There was a tear
In her yellow skirt.
But she could see fairies,
She knew where they'd been
Dancing in circles
On the grass's cool sheen.

She was deaf to the bell
Calling all in to tea;
But she could hear bird-talk
High in a tree.
She knew what they said there,
But she wouldn't say,
With her hands folded, dreaming
The morning away.

GOOD JAMS and JELLIES

GOOD JAMS and jellies mark a good cook, for fruit must be handled at the right stage in order to obtain the flavor of full ripeness, yet have enough pectin to make the product jell. This means either combining slightly underripe fruit with fully ripe, but firm fruit, or providing the pectin in the commercial form or as apple juice. The following recipes include all methods:

CURRENT JELLY

Use sound, slightly underripe fruit. Sort and wash, leaving on the stems; crush slightly. Add $\frac{1}{4}$ cup water per pound prepared fruit or no water at all—an excess of water merely has to be boiled off and is apt to make the jelly darker. Heat fruit slowly to simmering point. Boil about 3 minutes. Drain through jelly bag until juice ceases to drip. Make a second extraction by returning fruit to kettle. Add enough water to cover, boiling about 3 minutes, and drain through jelly bag. Combine the two liquids, and add $\frac{3}{4}$ to 1 cup sugar per cup of juice. No more than 6 or 8 cups of jelly should be cooked at one time; use a wide flat-bottomed aluminum or agate kettle. Stir juice slowly while adding sugar; boil rapidly to get a bright clear product. When bubbles are even-sized, after 5 to 10 minutes of boiling, test for "sheeting off." While testing remove the kettle from fire and pour liquid from side of metal spoon. If the two streams unite and sheet off to form one, the jelly is done. Skim and fill hot sterilized glasses. Cool. Jellies may be made from loganberries, gooseberries, and raspberries in exactly this same manner.

TO PARAFFIN JELLY

When jelly is set, loosen jelly from glass about $\frac{1}{4}$ inch deep with a knife dipped in hot paraffin; then after melted paraffin is poured on the jelly, rotate and tip glasses so that the paraffin penetrates into the slit and makes a perfect seal. Cover, label, and store in a cold, dark, dry place.

JELLIED CHERRIES

1 cup pitted cherries
1 pint apple juice
1 pound sugar

Add cherries and sugar to apple juice and boil the mixture until it sheets from the spoon. Pour into hot glasses and when cold, seal with hot paraffin following instructions given above. Such fruits as currants, sliced peaches, apricots, and plums may be substituted for cherries. Plums should be pricked 4 or 5 times to prevent bursting the skin.

STRAWBERRY JELLY

5 cups juice
7 cups sugar
1 box powdered fruit pectin

To prepare the juice crush thoroughly about $3\frac{1}{2}$ quarts fully ripe strawberries. Place in jelly cloth or bag and squeeze out juice. Measure 5 cups into a very large saucepan.

Measure sugar and set aside. Place saucepan holding juice over high heat. Add powdered fruit pectin and stir until mixture comes to a hard boil. At once stir in sugar. Bring to a full rolling

boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, pour quickly into glasses. Paraffin at once. Makes about 12 six-ounce glasses.

JAMS

The name jam is applied to fruits preserved by cooking with sugar without trying to keep the shape of the fruit. A jam should be bright in color, may or may not have a jelly-like consistency, may or may not have lost the original shape of the fruit or fruits in the jam.

The usual proportion is $\frac{2}{3}$ as much sugar as prepared fruit for every fruit except strawberries. The prepared fruit is measured into the kettle, the sugar added and the mixture stirred until sugar is dissolved and boiling point is reached. Rapid cooking preserves the bright natural color and natural flavor. When mixture begins to thicken, watch carefully and stir occasionally to avoid burning. When jelly point is reached, remove kettle from heat, and let stand a few minutes. This helps prevent fruit from floating. Skim and pour jam into clean hot jars and seal.

STRAWBERRY JAM

1 pound strawberries after hulling
1 pound sugar

Wash strawberries; remove hulls and any dark spots. Put berries into enameled or aluminum kettle or pan and crush with wooden spoon. Add sugar; stir occasionally and slowly until sugar is dissolved. Boil mixture rapidly until thick and clear—a matter of a few minutes only. When juice is thickened, pour into hot sterilized jars, and seal. Makes about 2 six-ounce glasses.

A good variation of strawberry jam is made by adding to the above strawberry jam one pint of cooked fine-shredded pineapple and $1\frac{1}{2}$ cups sugar; proceed to make jam as instructed above. Makes about 4 six-ounce glasses.

RIPE SOUR CHERRY JAM

4 cups prepared fruit
7 cups sugar
1 bottle fruit pectin

To prepare the fruit stem and pit about $2\frac{1}{2}$ pounds fully ripe cherries. Crush thoroughly or grind. (For stronger cherry flavor, add $\frac{1}{4}$ teaspoon almond extract before pouring.)

Measure sugar and prepared fruit, solidly packed, into large saucepan, filling up last cup with water if necessary. Mix well. Bring to a full rolling boil. Remove from heat and at once stir in bottled fruit pectin. Then stir and skim by turns for five minutes to cool slightly to prevent floating fruit. Pour quickly into glasses. Paraffin at once. Makes about 11 six-ounce glasses.

BLUEBERRY AND APPLE JAM

Grated rind of $\frac{1}{2}$ lemon
1 pint blueberries, fresh, canned, or frozen
1 pint diced tart apples
3 cups sugar
Juice of one lemon

Combine grated rind, blueberries, apples, and sugar and cook until mixture is thick and clear, about 20 minutes. Then add lemon juice and recook to proper consistency, about 2 minutes longer. Pour into hot sterilized glasses; cover with paraffin as instructed above. Makes about 3 eight-ounce glasses.

—G.W.H.

You can make

PEACHIER JAM

faster with CERTO

Peachier Jam?—Yes, indeed, with Certo! For Certo is a highly concentrated fruit pectin product makes fruits jell with just a *one-minute boil!* Jams taste richer—keep their lovely natural flavor, fragrance, and color because they don't boil away. You average 50% more from the same amount of fruit, too. Over 80 tested recipes with every bottle.

TRY THIS SPICY VARIATION!

Spiced PEACH Jam

4 cups prepared fruit
 $\frac{3}{4}$ teaspoon each—
cinnamon, cloves,
and allspice
 $\frac{1}{4}$ cup lemon juice
 $7\frac{1}{2}$ cups sugar
1 bottle Certo

To prepare the fruit. Peel and pit about 3 pounds ripe peaches. Grind. Measure 4 cups into a large saucepan; add spices and lemon juice.

For Homemade PEACH JAM—leave out the spices.

To make the jam. Add sugar to fruit in saucepan and mix well. Place over high heat, bring to a full rolling boil, and boil hard 1 minute, stirring constantly. Remove from heat and at once stir in Certo. Stir and skim by turns 5 minutes to cool slightly. Ladle quickly into glasses. Paraffin at once. Makes about eleven 6-ounce glasses.

5 doctors prove this plan breaks the laxative habit

If you take laxatives regularly—here's how you can stop!

Because 5 New York doctors now have proved you may break the laxative habit. And establish your natural powers of regularity. Eighty-three percent of the cases tested did it. So can you.

Stop taking whatever you now take. Instead: Every night for one week take 2 Carter's Pills. Second week—one each night. Third week—one every other night. Then—nothing!

Every day: drink eight glasses of water; set a definite time for regularity.

Five New York doctors proved this plan can break the laxative habit.

How can a laxative break the laxative habit? Because Carter's Pills "unblock" the lower digestive tract and from then on let it make use of its own natural powers.

Further—Carter's Pills contain no habit-forming drugs.

Break the laxative habit... with Carter's Pills... and be regular naturally.

When worry, overeating, overwork make you irregular temporarily—take Carter's Pills temporarily. And never get the laxative habit.

Get Carter's Pills at any drugstore for 33¢ today. You'll be grateful the rest of your life.

Yellow with Age

AT TIMES practically every housewife has made the unpleasant discovery that some of her white linen or cotton goods are not as white as when she put them away for a few weeks or months. They have yellowed in spots or all over. Disagreeable as this is, the articles may be whitened by very simple methods.

Margaret Furry, Textile Chemist of the USDA, advises trying the simplest remedy first. This is to launder the yellowed article carefully and hang it in the sun to bleach as it dries, or dampen the discolored area and spread the article out in the sun.

If this bleaching fails to work, it may be necessary to use a chemical bleach. This must be done with care for if left on too long, it will weaken or even rot the fabric. Follow carefully the directions on the package.

If making a bleach solution at home, the safest to use is sodium perborate. To treat a small spot, dissolve 2 or 3 teaspoons of the chemical in a cup of water and soak the stained places for a minute or two. Rinse and repeat if necessary. For larger stains, prepare larger amounts of the solution, but be sure to wash it out of the fabric at once, after treatment.

One cause of yellowing during long storage is the aging of the fiber from heat or light in the storage place, such as attics. Soap left in fabric for a long time may cause a yellow stain. Tea and coffee, which may appear as faint stains at first, darken with time. Iron rust, due to some iron compound in bluing or wash water, may develop.

The best remedy for these difficulties is to have white goods carefully cleaned before storing, soap or bluing completely washed out, any chlorine bleaches used in laundering neutralized with a little vinegar in the rinse water followed by a rinse in clear water, and finally the articles stored where they will get the best possible protection from heat and from light.

—A.A.—

SEW ZIPPERS BY HAND

PUTTING in zippers by machine has stumped many a home dressmaker. Now Miss Margaret Smith, clothing specialist for the Bureau of Human Nutrition and Home Economics, USDA, recommends putting them in by hand for any kind of fabric where there won't be too much strain. This is how she does it—and the same method is

**FARM
FREEZER**
FACTS and
FANCIES

Freezing Greens

BEET greens, Swiss chard, spinach and dandelions are among the "green leafies" that are excellent for freezing. Select young tender leaves. Cut off large tough stems. Discard all bruised, discolored or decayed leaves. Wash leaves thoroughly in cold running water. Scald in boiling water from 1 to 2 minutes, depending on the tenderness of the leaves. Be sure to stir the leaves during the scalding period so that all of them are evenly scalded. Chill in ice water. Drain. Package in moisture-vapor-proof containers and freeze immediately. Complete draining of greens is almost impossible, as some water usually clings to the leaves when they are packed. This water takes the form of frost on the frozen greens and may be used as part of the cooking water when the greens are prepared for the table. —Janina M. Czajkowski

used in making the finest gowns produced in Paris and New York custom houses.

First press a good crease in the placket. To do this, sew up the placket along the seam line with loose machine stitches that will come out quickly. Lay open the seam on the wrong side, dampen with a sponge, and press; then pull out stitches.

For hand sewing, pin in the zipper, laying pins at right angles to the zipper. Now here comes the important part about placing the zipper: the front edge of the placket should lie just past the teeth of the zipper about 1/16 of an inch. After pinning, sew in the zipper by hand, taking stitches right next to the zipper—so close that the needle brushes the side of the metal. Miss Smith prefers the back stitch, using tiny stitches and going back only half as far as the last stitch each time—working from the top side, of course.

Today in Aunt Janet's Garden New Phlox From Seed

PERENNIAL phlox do so much for the summer garden that I would miss them terribly if anything happened to mine. Of course I have to harden my heart and ruthlessly pull

out seedlings because they are the sinners that spoil my color scheme.

The safe way to be sure of colors has always been to get divisions of plants of the color desired—sometimes quite an expense if a great many plants are needed. But now the U.S.D.A. announces a perennial phlox that can be grown from seed developed at the Beltsville Plant Industry Station, seed to be available from commercial seed firms. The name of this phlox is Beltsville Beauty. Seed must be planted in the fall in order to expose them to the low temperature required to make them germinate. Colors range from white with salmon eye, pinks of various shades, reds, maroons and salmons.

The following spring the seedlings would be ready to transplant into their permanent locations. However, my preference would be to let them flower in the row in the garden—provided there is room for that—and then set them in the border according to color.

This introduction promises to do as much for home gardens as did the Korean chrysanthemums, the seeds of which may be started early indoors and flowers gathered in abundance in the fall. I'll never forget the thrill I got when my first crop of single Koreans came into flower. I have to admit that my affection largely has been transferred to the doubles, but even so, the singles are wonderful in arrangements.

No. 2138. This smartly pocketed, sleeveless frock buttons down the front and has a tea time apron teamed to match. Sizes 12-20; 36-46. Size 18, 4½ yards 35-inch fabric.

No. 2058. For the touch of something really different try this double-breasted effect with the closing left of center. Sizes 12-20; 36-40. Size 16, 4¾ yards 35-inch.

No. 2115. This easy-to-make tubbable cotton dress sports a clever yoke-sleeve combination and two deep pockets to liven the sidelines. Sizes 10-20;

36-40. Size 16, 3½ yards 35-inch.

No. 2148. A simple dress, cut for fun and cool comfort. The buttoned shoulders are a washday blessing. Sizes 6-14. Size 8, 3½ yards 35-inch; 2½ yards ric rac.

TO ORDER: Write name, address, pattern number and size clearly. Enclose twenty cents for each pattern wanted. Add 20 cents for our new Summer Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

It's here! Procter & Gamble's
latest, great discovery!

NEW! PATENTED!

cheer

SO GOOD you get the cleanest possible
wash with the least possible work!

Years of research and experimenting in Procter & Gamble's laboratories led to the discovery of the newest clothes-washing marvel—CHEER.

CHEER was tested and tested—under all kinds of washing conditions. And the

job it did was *SO GOOD* it surpassed the highest expectations of its makers.

Now CHEER is ready for *you!* And Procter & Gamble promises that it will give you the cleanest possible wash with the least possible work.

SO GOOD it washes clothes cleaner
in ONE wash than any soap will in TWO!

It's true! Laboratory tests prove that CHEER is *so good* it gets clothes cleaner in a *single* wash than any soap you ever used will in 2 washings!

SO GOOD you can get a bright, clean wash
even **WITHOUT RINSING!**

It's true! CHEER can give you a sweet, clean wash even without rinsing. Because CHEER *holds* dirt. So, when you wring out the suds—*away goes the dirt.*

You get the cleanest possible wash any "no rinse" suds can offer!

But if you *do* rinse, CHEER's your best bet for a cleaner wash than you'll get with any soap—any other type of washing product.

SO GOOD you get a snowy-white
wash with **NO BLEACHING!**
NO BLUING!

Without bleaching, without bluing—without help from *anything*—CHEER washes your white things clean as fresh snow. Your colored things look bright as new paint. Yet for all its power, CHEER is kind to hands, safe for washable colors.

SO GOOD you get a film-free wash
even **IN HARDEST
WATER!**

CHEER suds come up thick and fast in water so hard the best soaps known give up the ghost. Leave no sticky scum—in fact, CHEER removes the dulling film left on clothes by soap. You *never* need a water softener with CHEER!

SO GOOD you get a spanking-clean
wash even **WHEN HOT
WATER RUNS LOW!**

The hotter the water, the better the wash. But when the hot water runs low, CHEER won't let you down. Sturdy CHEER suds stand right up and go on fighting dirt and grease. *Whatever* the temperature, CHEER will give you a cleaner wash than any soap in the world will at the same temperature!

Try **cheer** once...and you'll **cheer** forever!

CHEER is the trade-mark of a special all-purpose detergent made by PROCTER & GAMBLE in the U. S. A.

THE YOUTH'S COMPANION

A Terrible Temper

By C. A. STEPHENS

BOSTON, THURSDAY, JUNE 25, 1891

HE was not a "red-haired" boy, but his temper, when roused, was a dreadful thing to contemplate, even from a safe distance. His hair was black as a crow's wing. I take pleasure in settling this point beyond controversy.

American boys very rarely lose entire self-control, even when excessively exasperated and very angry. It is asserted that there is no country in the world—unless it may be China—where schoolboys agree so well as in the United States. English and German schoolboys are said to fight far more frequently than our own, and French and Spanish boys at school frequently engage in sharp altercations.

Certain English and German writers defend this readiness to fight as a sign of desirable energy in their boys. It may be a symptom of energy, but it is also a symptom of brutality. After a long acquaintance with schoolboys in the United States, I am convinced that, as a rule, they avoid fights not from lack of animal courage but because of less excitable temperaments, and greater power of self-control.

We know from a hundred recorded instances that when real courage is demanded, in case of fire or flood, volunteers from among our schoolboys have never been slow to risk and even lose their lives. It has often been remarked, too, that these young heroes were the quietest, most self-contained boys in school, and not the fighters.

Clement Webb was oddly misnamed, for "Clement" means mild, and there was little that was mild in Clement Webb's disposition. His name should have been Ferox, or else Atrox, if names are to depict character.

I came to know him through teaching the school in the village where he lived. It was a place of fifty or sixty houses, two stores, a church and post-office. It was my very first experience in teaching, and was entered upon to eke out my funds as a student.

The school supervisor, who was also the pastor of the village church, examined me long and faithfully in arithmetic and English grammar. Indeed, he tried so hard to puzzle me in compound proportion and cube root that I suspected that he had some ulterior purpose. But I was fresher from these studies than he, and held my own.

Still he appeared to hesitate. At last he said, "You look rather young for this school. I'm afraid you will have a hard time here. It is a difficult place. I wish you had come to it with more experience; I wish you were older."

This was a hard objection to meet. I had thoughts of declaiming to him a paragraph from William Pitt's great speech: "The atrocious crime, sir, of being a young man, I neither attempt to palliate nor deny." But instead of saying this, I assured the supervisor that I was getting older every day, and that if he would kindly give me some needful hints from his own wide experience of the people, I hoped I should be able to get on.

"Well, well, my boy!" he replied, laughing, "I see that you have some of the wisdom of the serpent, and perhaps a little of the guile as well. I am going to sign your certificate. But you will need all your wisdom, and perhaps the

guile, too, to get on here and give satisfaction. The main thing here, just at present, is to give satisfaction."

I did not quite understand this hint. I had supposed that to "give satisfaction" it would only be needful to perform faithfully my duties as a teacher, which I should try to do. But I soon learned that this was not enough.

The people of the village were divided into two bitterly hostile parties. The school agent who had hired me belonged to one party, and had been elected after a hot contest. I was his teacher and the teacher of his party. Whatever I did, he and his clique were bound to be satisfied with.

That was all very well; but on the other hand, I was not the teacher selected by the other party; and the opposition was equally determined not to be satisfied.

While the first party were very cordial to me, the other party held aloof and scarcely noticed me at all. This difference extended to the children in the school, so that I discerned very quickly to which party a pupil belonged. About half were cheerful and obedient, while the others regarded my arrangements and all my words with sullen distrust and aversion.

I do not know a more disheartening situation than to be ground thus between the millstones of a school district feud. Under such circumstances, the teacher is forced to be a "trimmer;" and it was while trimming my sails to escape the squalls of the feud, that I ran afoul of the boy with the terrible temper.

School had been in session a little more than a week, when one day, as I entered the house at the close of the noon intermission, I heard screams, shouts, the rattling of the stove and other sounds of disorder.

Stepping quickly into the room, I saw this lad Clement—then in his fourteenth year—bareheaded, with disordered hair and clothing, and eyes that rolled wildly, rushing about among the benches, aiming furious blows with a broom-handle at any and all of his fellow-pupils, girls or boys.

I spoke sharply to him, and then, as he paid no heed, attempted to seize him. He turned upon me fiercely, and struck me with all his strength. Thereupon I laid hold of him in earnest; but I had great difficulty in mastering him, for he bit, scratched, and kicked savagely.

He was like a maniac. I was obliged to thrust him into a wood-closet and shut him up there, for the time.

Naturally, my budding dignity as a schoolmaster was somewhat ruffled. Besides, Clement had hurt a number of the pupils. I intended as soon as he had cooled to a realization of his offence, to punish him severely; and I considered the relative merits of a green-hide, ferule and birch withes. I might have had him driven from the school, but I must confess I desired satisfaction, myself, for his ferocity.

Something in the wildness of his behavior, however, struck me as singular. I kept him in the closet during the afternoon, meditating as to the best course in the matter; and it was not

till the last pupil had left the house, at four o'clock, that I opened the closet door and bade him come forth, not entirely sure that he would not attack me again.

But he came out looking very woe-begone indeed.

"What led you to fly at me and the others after that murderous fashion?" I asked.

"They plagued me! they tormented me!" he exclaimed, the tears beginning to start in his eyes. "They know I have an awful temper. They know it runs away with me, and that I can't stop it. They know it; and they kept hectoring me half the noontime on purpose to stir me up."

"But I had not hectored you. Why did you strike me?" I demanded.

"I do" know, I got a-going, and I couldn't stop myself."

At first I had little faith in such a statement of moral helplessness. I told the boy, rather harshly, that he could control his temper if he made a proper effort to do so.

"Oh, I do try, sir!" he exclaimed. "I try awful hard. I know it's spoiling me; but as soon as they begin to torment me, and I begin to think about it and look at them, it keeps coming on blinder and blinder till it's all a blur in my eyes, and I can't stand still another minute; and then I don't know what I do!"

In my inexperience, I did not know exactly what course to take. I had not the heart to punish the boy. I sent him home, simply bidding him take care for the future.

When I mentioned the matter at my boarding-place, my landlady, who assumed the task of keeping me informed upon all matters in the village, told me that Clement's father, now dead, "was another just such firebrand before him;" and that it was common opinion that Clement would yet seriously injure some of his school-fellows in his "mad fits." Former teachers had punished him. But there was a feeling abroad that he had not been flogged severely enough.

"He may kill some one and have to go to the gallows for it when he gets older," my landlady added.

A few days later I heard that Clement had indulged in another of his fits of temper, while skating on a pond, and had chased the other boys with stones and clubs. I was glad that this offence had occurred outside my jurisdiction; but that excuse did not avail me long.

A few mornings afterward, as I approached the schoolhouse, I saw Clement hotly pursuing two other lads, with the iron stove-shovel in his hands. When an older boy wrested it from him, the infuriated lad snatched his jack-knife from his pocket. I do not know what he would have done if I had not been in time to seize him from behind and disarm him.

He was put in the wood-closet again, struggling violently and threatening us all.

I ascertained that a number of the other boys were in the habit of provoking him out of pure mischief. One, in particular, would go on tiptoes around Clement, whispering to the others, "Step easy, boys. There's dynamite inside that fellow. Don't jar him, or he'll go off and blow us all sky-high!"

I tried to prevent the boys from

SLIM AND SPUD

Sniffer is 100 Percent for the Crows

(Continued from Opposite Page)

goaded him to these fits of anger; but my motive was promptly misconstrued. Clement's family belonged to the party that upheld the schoolmaster; while several of the children whom he had struck were of the other party.

Very soon the accusation went abroad that I would not punish Clement because he belonged to the agent's clique. Before I was aware, the supervisor had been appealed to to turn me out, on the ground that I upheld a dangerous and unruly pupil in assaulting the others with fire-shovels and knives.

Instead of visiting the school officially, the clergyman-supervisor first made me a private call one evening, and told me what had been said.

I gave him my impressions with regard to Clement, and related the circumstances.

"It is quite possible that the lad cannot control his temper," he said, thoughtfully. "Some strange traits and humors are inherited, and descend from parent to child. But you will have to do something with him. You must put a stop to his violent behavior in some way, or else there will be a public commotion which we cannot tide over."

I perceived that the supervisor, too, was obliged to be somewhat of a trimmer. Still, I shrank from administering severe chastisement. As I lay awake that night, thinking it over, Clement's tearful protestation recurred again and again to my mind: "As soon as they begin to torment me and I begin to look at them, it keeps coming on blinder and blinder, till it's all a blur in my eyes, and I can't stand still another minute."

A few years before I had bought a small magic lantern for evening entertainments. Thinking that it might be useful for me in amusing the children, I had brought it in my trunk.

Among the circular colored pictures

on glass, which accompanied it, was one of "a Malay running amuck." It represented the man rushing furiously among a crowd of people, with a drawn dagger. Clement's "temper fits" bore some resemblance to the "running amuck" of the Malays; and I wondered whether a mental antidote for the one might be extracted from the other.

An idea occurred to me, and I acted upon it. I rose betimes in the morning, and going to the village tinsmith, had him make for me a short tin tube, four inches long and an inch and a half in diameter. Over one end of the tube I had the smith solder a cap, and perforate the centre of the cap with an awl, to serve as an eyehole.

During the noon hour that day, I set the little circular glass picture of the Malay in the other end of the tube, and after school that afternoon, asked Clement to remain with me.

He took his seat with a look of sullen gloom on his face. No doubt he expected punishment for he knew that there was trouble abroad, and that he had not been punished for his last two offences.

"Clement," I said, when the others were gone, "I am at a loss what to do with you. I cannot let you go on assaulting the others. Why do you not control your temper?"

He began to cry and protest as before.

"Why can't they let me alone?" he exclaimed. "They know I can't help it."

"But do you try to help it?"

"Oh, I do, I do!"

"But how do you try?"

"Oh, I do know; but I do try," he protested.

I took out my tube and asked him to hold it to the light, place his eye to the awl-hole, and tell me what he saw.

He did so, and described the picture. "Oh, he's a-going it awfully; he's stabbing and cutting and frothing at his mouth!" He turned and looked at me,

with a guilty, appealing glance. "That's the way I do, isn't it?" he said, slowly.

"Yes," I replied; "that is very much the way you do. But I think you can help it. And now what I want you to do is to take this tube and carry it in the breast pocket of your jacket. Whenever any one 'hectors' you, and you feel your temper begin to rise, I want you to turn aside four steps and take out this tube and look into it."

He looked at me wonderingly.

"Yes," I went on, "look at the picture carefully, count all the people in it, and think only how savage and crazy that Malay looks, running amuck. If the boys and girls continue to torment you, go still farther off, and keep looking steadily at the picture."

"If you do that, just as I tell you, there is no danger whatever that you will run amuck yourself. Remember, it is a secret between us. Let no one else look into it."

He promised faithfully to do as I bade him.

A few days afterward I heard, through my landlady, that I had given Clement Webb a "charm" for his temper. Public opinion appeared to be divided on the question whether it was of the nature of a medicine or a talisman.

My object, of course, was to turn the boy's eyes and thoughts away from his tormentors. It was only an experiment; but I had no more trouble with Clement that term.

Clement carried out my instructions; and I have often seen him walking away from a group of shouting boys, and looking earnestly into his tube.

The other pupils regarded the "charm" with some little awe, as well as curiosity; and the grown-up malcontents of the hostile clique in the district were so much mystified by what they heard of it that they neglected to invent fresh charges against me.

I managed to pull through the term; and my friend, the supervisor, kindly remarked, when he paid the school his final visit, that I had got along better than he expected.

With that somewhat doubtful compliment I was obliged to be content.

Just for a Day the Past Lives Again

(Continued from Page 16)

among us. The fourth member is the aging farmer who just now is setting down these vagrant memories.

But I have wandered far from what I started out to do—to tell how the ghost of an almost forgotten institution walked again. The Old-fashioned Farmers' Institute was held at Wayne, a cross-roads hamlet of the Steuben County Hill Country. Wayne is fortunate in that it sits squarely on top of a natural-gas dome, so that many people have their own private gas well and everybody burns this most luxurious of fuels. I recollect being in Wayne once many years ago, and some of the elderly natives insist that I was there on two different occasions.

Considering that there was no opportunity for rehearsal, I feel that the meeting was a pretty successful re-

enacting of the past. The Local Correspondent was inclined to be apologetic for the attendance, but I felt it was as large as we could really expect. As a participant, it would ill become me to speak too enthusiastically concerning the excellence of the program. I propose, however, to let myself go a bit relative to dinner and supper. When planning for the meeting, I wrote that a community dinner was just as much a part of an old-time Farmers' Institute as was the Question Box or the Local Correspondent. The women of the countryside rose to the occasion in a wonderful way. It has been my good fortune to eat a multitude of excellent community dinners over a long span of years, but just now I feel like awarding the Grand Prize to the Women of Wayne. I run short of adjectives, so I will content myself with the sober statement that dinner and supper were characterized by an overflowing abundance of good food skillfully prepared. I do not know just how this came to pass. It may be possible that all of the elect women are honorary graduates of the College of Home Economics. It may be that each one of them was happily born with that peculiar talent for housewifely skill which is the equivalent of a "green thumb" on the part of a gardener. I might even hazard the unlikely guess that such a culinary triumph is the result of cooking with natural gas. However, it is doubtless not at all necessary that I should know the secret.

When the final goodbyes were said, Bill drove me back to Bath to be his guest for the night. I was in a happy mood, feeling something like a boy again because we had—just for a day—turned back the Clock of Time and recaptured a bygone past.

Frayed electric cords are tricky
From such things much trouble grows;
For an inch of insulation's
Worth a mile of fire hose!

NORTHERN PACIFIC RAILWAY
Main Street of the Northwest

THREE years ago this spring I came back to Sunnygables after a four-months' illness in the Southwest. Amid a number of uncertainties, one fact stood out. *I would not be able to continue all of my former activities.*

This situation made it necessary to make important adjustments so far as my farms were concerned. It is comparatively easy to make new plans, even to put them into effect when a fellow is feeling full of pep and ambition. But it is quite a different thing to make radical changes in one's way of life when a walk to the barn looms as a major venture.

Herd Sold

The first and most important adjustment to less activity and less responsibility was the decision to sell practically all my milking cows. This was not too hard a step to take because I could get an excellent price. Next I had to plan what to do with the land I owned, and lay out a scheme of operating it which would permit me to keep in touch with practical agriculture. *I wanted very much to do this because I had decided while I was ill that the most interesting thing I could do the rest of my life was to observe and report on agricultural practices, and, if possible, do some experimenting on my own.*

Young Associates

I was fortunate at the time in having five young men available for keeping alive my contacts in agriculture and to help work out plans for operating the farms in which I was interested. Two of these young fellows were my own sons. Three were young men who had worked for me or been around Sunnygables for several years.

My older son, Howard, was established on a large irrigated farm in the Pecos Valley of New Mexico. I had a small financial interest in his operation, but what was more important, Howard's farm gave me an opportunity to have first-hand contact with farm practices in a semi-arid section. This, I felt, was most important for background information. Since Howard was already well established, his situation presented no particular problem. Working out a set-up for my Inlet Valley, New York, farms, however, did. At one time my younger son, Johnny, and I talked about his operating them, but finally I sold him three places outright and left it to him to work out his own plans. He proceeded to open up a gravel bank on one place, and leased the land out for pasture. The other two places he combined and sold to Albert and Margaret Poelvoorde, one of the young couples who had worked for me at Sunnygables for several years.

This left me Sunnygables and one other place which was mostly pasture. The latter I sold to Ross and Marcella Yaple, a young couple who had always worked for me. Finally, I leased the Sunnygables farm and tenant house to Jack and Jean Conner.

Present Status

I have explained all of the above because visitors who come to Sunnygables and farmers and their wives who have read this page for years keep asking how I adjusted my situation when I could no longer be in active charge myself. Now I will report on how things stand at present:

1—My son in New Mexico sold out his operation this spring. He and his

wife do not want to return to the Northeast, so they have bought a small place in the Pecos Valley just south of Roswell, New Mexico, which they are developing into a permanent home. Meanwhile, Howard is waiting for some new farming or business opportunity to show up.

2—My son John—having opened up the gravel bank on one of his farms, leased the land for pasture, and sold the other two farms to the Poelvoordes—has moved to the Midwest, where he is associate farm director for the nation's greatest independent radio station, WLW, at Cincinnati. His job keeps him in constant observation of Midwest farming.

3—Albert and Margaret Poelvoorde, who bought the two farms from John (we always speak of their place as the Albright Farm) are working away at building up their herd, raising a family (they have three children), and generally establishing themselves in the country on a fully independent basis.

4—Ross and Marcella Yaple have sold off most of the farm they bought, and Ross divides his time between working for Jack Conner and for me on my experiments.

5—Jack and Jean Conner have a lease on Sunnygables under which they own a Brown Swiss herd fifty-fifty with me. Eventually, they will buy such of my farm equipment as they need. They own a large flock of hens.

Serious Business

For all of the young people mentioned above, farming is serious business. Those who are engaged in active farming have to live off what they do, pay taxes, insurance, interest on debts and, if possible, make payments on principal.

I stress the fact that whatever reporting I do, or whatever experiments I undertake, has as a background young farm people who have no other source of income than their farming. *Too much interpreting of agricultural practices is done without the benefit of such a realistic setting.*

The other course I could have taken after I was ill would have been to sell all my farm property when I sold my herd and get out of the business. This was what some of my friends advised, but I am sure it would have been a mistake. The situation in which I find myself is most interesting. It is sometimes discouraging, *but it's also life the way it has to be lived in the open country.*

Experiments

In this long explanation, which I assure you I would not have written except as a sort of blanket reply to people who appear to be interested, I now come to the most interesting activity I have left in life—*trying out new farm practices.*

I am quite sure I have written here many times that it pays to have some new things under way on farms just to keep the people who are doing the work alert and to make farming more

interesting. *I believe that the young men with whom I am working agree with me.*

Trying out new farm practices, and, particularly, reporting on them as fully as I do, has its bad features. Sometimes the experiments interfere with regular farm work. Part of the time they turn out badly, *especially if they are original and daring enough to require taking some real chances.* The young couples with whom I work appreciate this. So we have an understanding. We never try out anything which they are unwilling to undertake. If the experiments turn out well, they get the benefit. *When they don't and they are hurt, either through interruption of their farm work, loss of crops or because extra expenses are incurred, I try to reimburse them one way or another.*

I, of course, get my return out of the fun of the experiments and out of the occasional one which contributes enough information for me to capitalize on it.

Work Under Way

Following is a partial list of some of the farm practices being tested out on the farms in which I am interested:

1—Development of a plan of pen stabling which will eliminate practically all hand work, keep cows clean and healthy, cut down on the cost of per head stabling, use no more bedding than is required in stanchion stabling, and cheapen production by getting cows to eat more silage and hay. In three years we have made great progress towards these objectives.

2—The use of elevated milking stalls to cut down on the fatigue of milkers and to enable milkers to take better care of the udders of the cows they milk.

3—The development of a scraper for a tractor which will enable an operator, without hand labor, to keep clean all the paved surfaces, including the barnyard, on which loose cows eat, drink and travel.

4—Storage in a trench silo of unchopped "spring growth" of pastures and meadows. The purpose of this experiment is to work out methods which will enable a farmer who is short of capital to make good grass silage with a minimum investment in storage space and equipment. This is a risky experiment, and one on which I may get caught and have to pay Jack Conner for some spoiled grass.

5—A trial of sprinkler irrigation in growing a garden and maintaining an improved pasture through the hot dry season.

6—The development of pastures which will be so good that cows won't eat much of any grain on them. My goal here, which I probably will never entirely reach, is always to feed dairy cows at milking time all the grain they will eat, but to keep down their consumption because the pastures they are grazing are so lush that they can eat all they can hold in less than an hour, and so rich in protein that they just won't need much grain, and therefore won't eat it.

7—The testing of four seeding mixtures for best results on land which will be pastured. From some of this land the *spring growth* also will be removed for grass silage, and part of the later growth for hay. These mixtures are:

(1) **Alfalfa and Orchard Grass.** Already I am scared about this one because despite the late spring, orchard grass headed out on May 21 at Sunnygables, while alfalfa had not yet budded on June 3.

(2) **Alfalfa and Brome Grass.** This has been a very successful mixture for us. The brome grass heads before the alfalfa (it came out this year on May 28) and it tends to get awfully tall and hard to handle. But on a ten-acre piece grazed during May, the cows ate the brome grass in preference to alfalfa, so that on June 1 the brome and alfalfa had about the same maturity and seemed to furnish an ideal *spring growth* for grass silage.

(3) **Ladino and Brome, Ladino and Orchard Grass, Ladino and Reed's Canary,** the latter for wet spots. These mixtures are for land from which it is not possible to remove the *spring growth* for grass silage or to make any later because it is too rough, too wet, or inaccessible to the barn.

(4) **Birdsfoot Trefoil and Timothy.** We are trying birdsfoot all over the place and as yet have been only moderately successful in getting startis.

8—Testing practices which will keep the legume stands in permanent improved pastures and fields which are used for pasturing, grass silage and hay as long as possible. Already we think we have determined that we cannot manure these fields except with light applications of hen manure. The best success we have had to date is to top-dress them annually with from 200 to 400 pounds of 0-19-19 fertilizer with boron added. Clipping and heavy grazing seem to help, too. At least on our fields, the earlier we turn out on them, the better the legumes seem to do.

9—Testing to find the cheapest and most effective manner of reseeding fields which have run out. Here is where we think we can use the strawy manure from our pen stables to best advantage. We seem to be getting the best stands of legumes and grasses from fields of oats which are spring seeded and the oats grazed off. We also have pretty good success when the oats are cut early for silage. During the last two years we have not had too great success in establishing seedings on fields sown to rye for late fall and early spring pasturing. What we would like to do is to develop some method of working up and seeding an old sod and using our pen stable manure which won't require too much in the way of investment and equipment, and which will cut to the very minimum the months in which the field is out of production.

10—Learning all we can about protecting the health of dairy cows and so handling them that we increase their useful life span. Here again we think we have made real progress. We have purchased a few quite old Brown Swiss cows which were going down hill very rapidly because of the conditions under which they were being handled, and have rejuvenated them. Also we are (with our fingers crossed, of course) keeping reasonably free of mastitis, Bang's Disease, and the diseases which kill off young calves. Generally speaking, our program calls for a minimum of confinement and pampering, and a maximum of fresh air, freedom, and top quality forage.

"CHEER"

The newest and most revolutionary all-purpose detergent recently introduced by THE PROCTER & GAMBLE COMPANY after 19 years of scientific research, is a product known as CHEER. Laboratory tests actually prove that CHEER gets clothes cleaner in one wash than any known soap can in two. Also it does away with the washday chores of bluing, bleaching, and using water-softeners, or even rinsing.

Most special detergents are made by extremely complicated processes. Chemically they are different from regular soap but they look and wash much like soap. Both products have what scientists call "head-and-tail" molecules. It seems that the "tail" molecule hates water and sinks into the greasy dirt, while the "head" molecule loves water. The result is that the molecules of the detergent surround the dirt particles, separating them from the surface that is being cleaned and carrying them away with the water.

Although regular soaps work the same way, the detergents go one important step further in their cleaning action in that, unlike soaps, they do not react with the minerals in water to form scums and stubborn films that settle out again on dishes, fabrics or other surfaces. CHEER's particular advantages, however, lie in the fact that in addition to removing dirt and keeping it suspended in water, it forms safe rich suds that protect, as well as clean, fabrics.

These days a great deal is being said about retirement plans. One of the best is the kind that the individual builds for himself. If you are interested in that kind of retirement, drop a postcard to FARMERS AND TRADERS LIFE INSURANCE COMPANY, Syracuse 1, New York, and ask for information about their retirement and family income plans.

The annual meeting of the NEW YORK ARTIFICIAL BREEDERS COOPERATIVE will be held at their headquarters on the Judd Falls Road, Ithaca, New York, on August 3. In the meantime, the NYABC will be glad to send you information about artificial breeding.

The HAZEL-ATLAS GLASS COMPANY of Wheeling, West Virginia, is introducing a new arc-lid which is white enamel lined. They also have an Atlas, Jr., Mason three-fourths pint jar for small families.

Bulletins on the chemical control of weeds are available for the asking from THE AMERICAN CHEMICAL PAINT COMPANY of Ambler, Pa. You may be particularly interested in their chemical brush killer.

The W. R. AMES COMPANY, San Francisco 7, California, has developed the Ames Ball Coupler for joining sections of portable overhead surface irrigation pipe. Detailed information about this labor-saver is available from W. R. Ames Company at 150 Hooper Street, San Francisco, Calif., or 2903 E. Broadway, Tampa, Florida.

Service Bureau

By H. L. COSLINE

IT'S A LOTTERY

I am having some difficulty over premiums ordered from New Process Sales Co., 1331 N. Western, Chicago 22, Ill. They sent me the wrong premiums, and my letters to them about this have gone unanswered.

We wrote this outfit but received no reply. We then took it up with the Chicago Better Business Bureau. They tell us that they have had a number of complaints against New Process Sales Co. The majority of these complaints have to do with merchandise paid for but not received, although some people have alleged that merchandise received was not as they had expected from catalog description.

All complaints reported to the Bureau have been referred to the Post Office Department. Inasmuch as the Bureau views the operation of this company as a lottery in which complainants have participated, it is suggested that complete details of any unsatisfactory transactions be forwarded to Mr. J. H. Marks, Inspector in Charge, Post Office, 433 West Van Buren St., Chicago, Ill.

— A.A. —

OLD AGE ASSISTANCE

Can you give me any information about the Old Age Pension? How should I go about applying for it, and how much can I get a month?

There is no "Old Age Pension." There is Old Age Assistance which is administered through your county welfare department. Application should be made through that office. There is no set amount that anyone gets. It depends on the circumstances in each case. Laws in various states vary somewhat as to residence requirements, etc.; but complete information can be obtained from any county welfare office.

— A.A. —

GIVE COMPLETE ADDRESS

Since the Post Office has found it necessary to cut expenses, many Post Offices no longer give directory service on mail. We have had a number of letters returned recently marked "Insufficient Address." When writing us, be sure to give your complete address; and also, when writing about some commercial concern, be sure to give the most complete address you have available for them.

If your inquiry hasn't been answered by us, it may be because we did not have a sufficient address for you and our letter was returned. If you will drop us a line giving this to us, we will take care of your inquiry promptly.

— A.A. —

TRESPASS

The Service Bureau has been getting many requests for the laws and regulations on posting, stray livestock and fencing laws, and similar farm problems. We are glad at all times to answer any specific questions about such problems. However, we do not have available in booklet form such laws and regulations. Let us know what your problem is and we will do our best to advise you.

— A.A. —

I wonder if you would run an item in the Service Bureau to help me find my sister, Sadie. She was said to have married a Joe Gibbons of Route 6, Fulton, N. Y., about 1937. I haven't heard from her in several years and am very anxious to locate her. If anyone knows of her present whereabouts, please write me.—Mrs. Oliver Remington, Old Chester Rd., Huntington, Mass.

FATAL TRUCK ACCIDENT

On a slippery road, this logging truck hit and sheared off an electric light pole, plunged 60 feet down a bank, landing in the Winooski river. The driver, Edwin R. Cole, aged 21, was instantly killed.

Mr. Cole carried the protection of our travel accident policy, so loss of life payment, as provided, was made to his father who wrote us as follows —

Marshfield, Vt.
Feb 14, 1949.
North American Accident Ins Co.
Dear Sirs
I wish to thank you for the check in the amount of \$1,000 which your agent Mr. Melby of No. Ferrisburg, Vt. has personally delivered to me today. I not only greatly appreciate the protection my son Edwin had but also the promptness you have shown in settling the claim.
Yours Sincerely
Warren L. Cole Sr.
Father of deceased Edwin R. Cole

Amazing New Ferguson Side-Rake STOPS COSTLY LEAF LOSS

NEW WAY TO RAKE HAY

faster... better!

**SIX-BAR OFFSET REEL
MAKES A BIG DIFFERENCE**

The FERGUSON SIDE-DELIVERY RAKE is designed specifically for tractor operation. It greatly reduces leaf-shattering . . . safeguards the quality and value of your hay!

This rake is truly unique. New six-bar offset reel handles hay GENTLY. No pitching, kicking and tossing even at high speeds. Instead, your hay is lifted gently, up and over into light fluffy windrows with the precious leaves turned inward.

True "sideward" raking action reduces the distance from swath to windrow by 50 per cent. There is far less rolling and churning . . . no sudden jarring.

Tractor-mounted . . . power take-off driven . . . Finger Tip Controlled. And it's surprisingly low in price.

Harry Ferguson, Inc.
Detroit, Michigan

December 29, 1949
Ischua, New York

Having seen the Ferguson Side-Delivery Rake on display, I was interested in seeing it perform in the field.

We had mowed a portion of a meadow (second cutting) and raked the hay with a conventional side-delivery rake and baled ten (10) bales.

I was to give up this operation as unprofitable even in the face of dry pastures and hay shortage when John Graham of Graham & Gorecki said that he could rake enough hay from this field to make it profitable.

I accepted his challenge.

John came to this same farm with a Ferguson Tractor and Ferguson Side-Delivery Rake. He re-raked the same field from which we had raked and baled the ten (10) bales with a conventional rake and to our surprise, we baled thirteen (13) bales after the Ferguson Rake.

John proved his point and we continued to mow, rake and bale and salvaged 450 bales which is approximately 22½ tons of hay that would not have been available for feed, had it not been for the new Ferguson Rake.

This is just like getting something that isn't there.

The rake paid for itself this fall alone and needless to say I purchased, or should I say, I took one that didn't cost me a cent.

I can't say enough in praise of the Ferguson Rake.

Its performance is unbelievable.

Signed, Bert E. Pepper

THE FARM PAPER OF THE NORTHEAST

"You Never Miss the WATER...!"

By E. R. Eastman

ON THE radio the other night I heard someone sing an old ballad that Mother used to sing when I was a small boy, entitled "You Never Miss the Water Till the Well Runs Dry." That statement is true of a good many situations in life, and it's especially true of the water supply. Believe me, I know! I had two sources of water supply on our farm, one for the barn and cattle, the other for the house. Some four years ago the barn supply ceased to run. Upon investigation I found that the old pipe, which had been down for years, had rusted out, and I went to all kinds of trouble and expense digging a ditch, laying new pipe from the spring near the woods to the barn, and going through considerable red tape for the privilege of pushing the pipe under the State highway.

All went well until last summer. During the bad drought, the spring which supplied the water for the house dried up for the first time in the history of the farm, and I had to spend about \$900 for labor and piping to tap the pipeline to the spring supplying the barn. I thought I had the problem solved until a week later the whole system stopped and I found that the spring which was now supplying both house and barn was completely dry.

Finally, we opened up seven different ditches leading to small water sources and piped them all into a reservoir sunk into the spring. But there wasn't gravity enough to force the water both to the barn and upstairs into the bathroom in the house, so I had to install a booster pump. Acting on the advice of a dealer who didn't know his business, I got the wrong kind of a pump, and I am still having some trouble with the system because air gets into it and we have to prime it to start the water all over again.

I mention this personal experience because there are thousands of farmers and millions of city dwellers who are also having serious water supply troubles. And what is even more important, if we don't do something about it there will be more water troubles rather than less in the future. It has become one of the most serious of our problems.

The sad fact is that America's water supply is drying up, and the water table in the soil seems to be sinking. I don't need to remind farmers of the Northeast of the serious drought last summer and how hundreds of you had to carry water to stock. I was in New York City on one of the "water saving" days. In the hotel where I stayed was a sign—and in many other public places — forbidding the use of water for baths or for any other purpose unless it was absolutely necessary. The reservoirs supplying New York City had mostly dried up, and dozens of other American cities face serious water supply troubles.

Our Associate Editor, Mr. H. L. Cosline, recently re-

A modern water system is a blessing if the supply of water holds out.

turned from an extensive airplane trip across many sections of the West. His purpose in going was to study the cattle situation out there. He came back impressed with the fact that the water supply is the Number 1 problem in most of the West.

Why is it that the water supply in both city and country is going bad on us? In one sentence, we are using more and wasting more. In my boyhood my brothers and I pumped the water from a pump in the front yard and carried it in to fill the reservoir on the back of the kitchen stove and the tea kettles, and left a pailful for drinking water. I'll bet half the young folks now never even saw an old-fashioned kitchen stove reservoir. In the wintertime we took a bath with relatively little water in the old wash tub—when we didn't forget it. In the summer we got our baths in the old swimming hole.

Look at the situation now. The bathrooms and the flush toilets with a large family take hundreds of gallons of water a day. Modern washing machines and laundries use more water in one wash day than was used in fifty wash days when I was young. Literally billions of gallons of water are used in both city and country for irrigation, watering lawns and gardens, air conditioning of buildings, and washing automobiles. (The water used by any large city is equivalent to a moderate size river). On a dairy farm more water is used in the milk house

(Continued on Page 10)

On a dairy farm today more water is used in the milk-house alone than the whole family used forty or fifty years ago.

“Thank Goodness we’ve got a Big FARM-SIZE G.L.F. FREEZER”

THE big G.L.F. Farm Freezer has room for them all . . . the earliest asparagus and rhubarb right through the summer’s garden produce, to the latest fall fruits and berries, and plenty of room left for pork, ham and bacon, anytime you are ready to butcher. Room too for a side of beef or a veal calf and for those broilers that are just right to kill—no use feeding them any longer.

Farm families who have been using a freezer for years find that there is always something new that they can keep at its best in a freezer. That’s why they like a *big, roomy* freezer that can even take care of the deer the hunter of the family

brings home in the fall and the brook trout early in the spring.

Thousands of farm families helped design the farm freezer—that’s why it fits farm needs so well. **Front Opening**—Just like your refrigerator. You see at a glance your entire stock of frozen foods. Easy to put things in and take them out.

Eight Shelves for freezing—each of the eight shelves in the 30 cu. ft. freezer (four shelves in the 15 cu. ft.) are freezer plates. You freeze as you store.

Six inches of insulation—This unusual amount of insulation means economy of operation and extra protection.

Rollo-Grip Locks automatically latch the doors and prevents cold loss and failure to close the doors tightly.

Farm Size—The 30 cu. ft. G.L.F. freezer is the lowest cost freezer per cubic foot of space. It’s the right size for farm families that really use a freezer. For smaller families the 15 cu. ft. size is available.

Your G.L.F. Agent Buyer or store manager has complete specifications on all G.L.F. Freezers and can help you determine the right size for your family.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

Farm Size ***G.L.F. Freezer***

Clambake, Show and Sale Highlight Holstein Convention

MONDAY of National Holstein Week in New York saw more than 1,500 convention visitors in attendance at a clambake and cattle show at the Harden Farms near Camden. Guests were entertained for lunch at the Syracuse Yacht Club by Babson Brothers, then took busses to the farm which is owned by Charles H. Harden's Camden Wire Company and managed by Dr. E. S. Harrison who has written many articles on cows for *American Agriculturist*. The cattle show was a demonstra-

tion of the Holstein breeding program being carried on by Harden. It featured the female families of the herd, and the offspring of the two main herd sires, Dunloggin Deen Var and Dunloggin King Var.

Eighty-three of the 200-head herd was milking in 1949 and averaged better than 16,000 milk and 603 pounds of fat. With 85 milking this year, herdsman Bruce Stahl reports that they are running ahead of the 603 pound average. Top in the long list of high producers in the herd is Alcartra

Bessie Ormsby Korn-dyke, born in March, 1938. Her sire was Round Barn Winterthur Ormsby Great and her dam Alcartra Korndyke Bessie. Last year, at 11 years of age, she produced in 365 days, 26,316 of milk and 1,007 pounds of fat, milked by hand three times a day. Her two previous records were more than 900 pounds of fat.

S. B. Hall, Troutville,

Dr. E. S. (Ed) Harrison, left, manager of Harden farms, was the busiest man at the show and clambake, but he had time for an interview with radio station WGY's farm director, Merl Galusha.

Host to visitors to Harden Farms during the Holstein Convention was Charles H. Harden, right, whose Camden Wire Company owns the farm. He is visiting with a National Holstein-Friesian Association director, Richard Wills of McDonogh, Maryland.

—Staff Photos

Oregon, was re-elected president of the National Holstein-Friesian Association at the annual meeting held in Syracuse Wednesday. Also re-elected were: Harold J. Shaw, Sanford, Maine, vice-president; and directors H. G. Miller, Northfield, Minnesota; Fred W. Tullis, Monroe, Michigan; Iver W. Youngquist, Bow, Washington. Albert B. Craig, Pittsburg, Pa., stepped down from the board of directors as senior member to be succeeded by Herman A. Snyder, Montoursville, Pa.

The Homecoming "Super Duper" Convention sale Thursday was well named as it topped every sale of the past 30 years. Sixty-nine head went through the ring for a total of \$97,190. The \$1,424 average was the best since the St. Paul, Minnesota, sale of 1920. R. Austin Backus and Gene Mack cried the sale, and the sale committee was composed of J. M. (Jim) Bieremeister of Van Horne Farms, Van Hornesville; M. S. Prescott, Sandy Creek, and R. Austin Backus, Mexico.

Consigned to the sale was stock from 55 breeders from 13 states and Canada.

Top bull and cow were both from New York State. They were Smithland Supreme Champion, consigned by Orson D. Smith, Canastota, N. Y., bought by Forsgate Farms, Jamesburg, N. J., for \$7,000; and Butterfly Veediction Pansy, 2½-year-old twin consigned by R. Austin and Jay W. Backus, bought by J. S. Johnson, Oldwick, N. Y. for \$6,100.

Hickoryville Mooie Canary, three-time grand champion of Eastern States Exposition, consigned by Harden Farms, sold to Spitzer Brothers, Strongsville, Ohio, for \$3,100. Mr. and Mrs. Richard D. Ross, Gowanda, N. Y., purchased Crescent Beauty Gracious, consigned by Allen Hetts of Fort Atkinson, Wisconsin, for \$4,000.

Gibson Brothers Build \$300 Barn Cleaner

THERE are various kinds of mechanical barn cleaners. The one at Gibson Brothers' dairy farm, near Stuyvesant in Columbia County, N. Y., was homemade from a pair of motors, \$70 worth of logging chain, some junk parts and a pile of hardwood sticks. It cost only \$300 for materials.

The low expense is only part of the story. The other part is how efficiently

it works. Some of the older-type gutter cleaners had trouble in winter. The one built by Henry, George and John Gibson neatly handles its 240 feet of gutters in cold weather as well as hot.

It has been operating at top efficiency for three years, and the brothers say it has more than paid for itself each of those years. This is because it saves over 100 minutes at every cleaning. All this saving of time, as well as labor, runs into a tidy total per year.

It allows the Gibsons, who generally milk around half of their herd of 90 Holsteins, time for such land improvement projects as laying down 1,500 feet of drainage tile in the past two years, and digging five miles of drainage ditch last spring—this added three acres to one field alone.

At the time they were considering buying a gutter cleaner, one adequate to their barn's needs would have cost them \$3,000. They cut that quoted price 90% by doing the job themselves in three weeks, off and on.

It consists of two units. One is the endless chain whose wooden paddles carry manure to a small pit at the end of one of the barn's two gutters. There another unit, the elevator, relays the manure out of the barn and drops it into the waiting spreader.

For their gutter circuit, the Gibsons used ¾ inch logging chain. Besides being inexpensive, the 250 feet of chain runs free, due to its loose-link character, without buckling, clogging and "freezing."

The cement gutters are 18 inches wide. By making the hardwood cleaning paddles 17 inches long, there is plenty of clearance. The brothers point

out that the paddles could also be made of angle iron.

The paddle is held firmly by means of an iron bar welded to the chain link. This bar is ¾ by 1½, by 4 inches long. Two bolts fasten the paddle to this bar. The paddles are two feet apart.

The chain moves 12 feet per minute. When a paddle reaches the manure-dropping pit, it whips around and is scraped by an iron cleaning bar. The paddle then goes around, under the floor, to the beginning of the other gutter, and starts another round trip. At each end is the flywheel from a junked gas engine. It serves as an idler around which the chain passes.

The driving power is provided by a 3 H.P. motor which cost \$130. The brothers would also have paid \$150 for a gear reducer, but none happened to be available. So they promoted one in a junk yard. It had formerly been used on a bakery's dough mixer, and cost them only \$7.

This provides a reduction of 36-to-1, but still too fast for the gutter chain. Combining it with the 4-to-1 reduction from the transmission of an old Model-A Ford solved the problem.

Another old Ford transmission is used with the elevator unit. Here, power is provided by a 1 H.P. motor which cost \$60. Its driving speed is reduced 7-to-1 by running a pulley around the wheel of the other Ford rear end. Then its transmission reduces this another 4-to-1, so that the elevator, as a result, runs 60 feet a minute.

The elevator platform is 28 feet long and made of wood. Its paddles are 10 inches long. Returning down one side of the elevator, they whip around in the pit, and bring manure up the other side to the drop-off into the spreader.

It's the chain operation that eventually makes or breaks most cleaners. The Gibsons say they solved theirs, while cutting costs, by using sturdy, non-buckling logging chain and going on from there with their own welder

—no foundry castings here.

On a very cold day, a bar slipped under the elevator chain cracks any freezeup and it's ready to operate. But freezing troubles are practically nil, because the elevator empties into the spreader standing in a built-on shed. This was needed to house the spreader and tractor anyway.

It keeps manure from blowing, and prevents snow and freezing rain from gumming up the elevator. One winter day, a group of visiting farmers came to see the Gibson cleaner, which was the second in the county and its first homemade one.

They inquired about freezeup troubles.

"How cold was it this morning?" Henry Gibson asked.

"She was 16 below at my place," one visitor replied.

Gibson flicked the switch, and the mechanical hired man hopped right to work.—William Gilman

Automatic barn cleaner at dairy farm of Gibson Brothers, Columbia County, N. Y., uses an old auto rear end for gear reduction on motor which runs elevator out to manure spreader. Elevator travels 60 feet per minute.

—Photos by: E. Gilman

How to convert ¾ inch logging chain into a barn cleaner is shown here by Henry Gibson. Hardwood paddles are bolted to iron bars which have been welded to chain links every two feet.

THE EDITORIAL PAGE

WHAT WE CAN DO

ON July 4, 1776, our fathers signed the Declaration of Independence. On this 4th of July, 174 years later, it is time for us to make a new Declaration of Independence. It is time to remember that the liberties which cost our fathers so much are rapidly being lost, and that these losses nullify their untold sacrifices.

It is time to emphasize again that true liberty is based upon the welfare and the importance of the individual, that government exists for the individual and never the individual for government.

On my desk as I write is a letter from a friend referring to an editorial which I wrote in the May 6 issue of *American Agriculturist*, in which I pointed out that the hidden taxes on a 21c quart of milk amount to 8c; on a pair of \$9.00 shoes, to \$3.00, and that there are similar hidden taxes on most of the things we buy. Therefore, it is the poor people who unknowingly really pay the largest share of the taxes.

"All right," wrote my friend in his letter, "but what can we do about it? Lots of doctors diagnose the cause, but not all can tell the cure."

A Freedom meeting in Rochester last winter answered the question of what we can do about it with the following suggestions:

WHAT CAN BE DONE

"We fighters for freedom do not think it necessary for the lovers of freedom to come together in one vast organization at present nor in one political party, although we do propose organized effort. But what is absolutely vital is that every freedom-loving American should arouse himself to the danger, and, secondly, that we shall aim at a common target.

"You who read this can do more than you might think. Start fighting, by voice and vote. Begin right within your own circle of acquaintance:

"1. Talk to your own family against statism and for freedom. Make sure, first, that your own wife, children, and relatives know what is at stake.

"2. Talk against statism in your office, factory, lodge, club, church, at lunch, wherever you meet people. An audience of one is not too small.

"3. Write against statism to your friends, to the newspapers, to radio stations, and above all to your representatives in Washington and the State Capitol. Mention the matter even in ordinary letters on other topics. Write and write again.

"4. When a political candidate, of whatever party, raises his voice for anything that smacks of statism, of handing out something for nothing, of government control over our property or actions, hit him hard with your voice, pen, and, above all, your vote. Influence others to strike back at him. This isn't any play-spell now. It's late. We are fighting to stay free men and women.

"5. When a political candidate or office-holder of whatever party makes it plain that he is sincerely a fighter for freedom, fight for him and fight hard.

"6. Join an organization that is working against statism and for liberty. There are many such springing up all over the country. You will get aid and stimulation from others who are fighting in the same cause. And there are more of us every day."

THE PAY-OFF

FAITHFUL gardeners are now reaping the results of their hard work and skill. Starting as soon as the snow was off, we had a good supply of parsnips and vegetable oyster (salsify) fresh out of the ground. A little later, and continuing for two or three weeks, we feasted on fresh asparagus. And I mean fresh, for you just can't buy the same quality in a store. We have had plenty of lettuce and radishes for weeks, and on June 15 we had a big strawberry shortcake made with berries fresh out of the garden. Yum! Yum! There will be plenty of berries to put into the freezer, too, providing we can beat the thieving birds to them.

Peas were ready to eat and to freeze by June 24, and from now until freeze-up there'll be a constant succession of vegetables of a freshness and quality that cannot be had except in vegetables that go direct from garden to table. After freeze-up, of course, we will fare nearly as well till spring with

By E. R. Eastman

two freezers jam-packed full of meat, fruit and vegetables.

Out of this experience of raising much of our own living year after year comes the emphatic conclusion that market garden growers and wholesale and retail handlers of fruits and vegetables must give more and more attention to maintaining the fresh quality of these products until they reach the consumer. When better use is made of refrigeration, quick freezing, and fast handling of the product, a tremendous increase will be seen in consumption.

NORTHEAST LEADS

WE have been saying for years that the Northeast is the largest poultry-producing section in the world. Now Dr. John Huttar, G.L.F. poultry specialist, writing in the Monthly Economic Letter of the Northeast Farm Foundation, comes along and proves it. According to John, taking 100 as the index of poultry numbers in 1900, the Northeast jumped to an index figure of 260 between 1900 and 1950. The Midwest, which used to lead the Northeast, rose only to an index figure of 180, while the United States as a whole increased from an index figure of 100 to 214.

There are four good reasons, says John, why the Northeast leads all other sections in the production of poultry products: (1) Better markets; (2) better bred stock; (3) good poultry climate; (4) more poultry "know-how." "Of these advantages," says Dr. Huttar, "the two that our northeastern farmers must guard if they are going to continue to lead are their markets and their better stock. As margins shrink in the poultry enterprise, these will become increasingly important, as was shown in the 1930's."

"CUT AND COVERING" FARMING

AFTER observing farming methods up and down the Northeast farm country for many years, I am convinced that tractor farming may be and often is poor farming. I'll never forget when as a 14-year old boy I was learning to plow and my boss sternly warned me against "cut and covering," meaning, of course, that if the plow hit a root or a rock and jumped out of the furrow, I was to back the horses up and pull the plow back and not leave any unturned sod.

Ride up and down the country as I have done this spring and you will count more plowed fields than not where the tractor plow went out and no effort was made to back up and turn the skipped sod over. Grass and weeds will grow in such fields all summer. In their hurry, not enough farmers plow off the ends of the field where the tractor is turned around. Also, in mowing the meadows, little effort is made to get close to the fences. The result is that the brush and weeds around the fences grow out farther each year.

You will tell me if I am wrong, but I think farmers would make just as much money if they worked a little less land and did a better job on what they do work!

FED UP ON PESTS

AS I have before indicated on this page, we raise a large part of our living on our own farm, and it would be a comparatively simple proposition were it not for the pests and vermin with which we have to contend. They have been particularly bad this year.

We have had a constant battle with the woodchucks to keep them from destroying a quarter of an acre of peas which we broadcast. We bombed them out of every hole near the peas, only to have a new gang move in and dig new holes within a day or two.

Similarly, it has been a fight to keep the blackbirds and starlings, to say nothing of the crows, from pulling up the sweet corn. At this writing we

and the birds are having a race to see which will get most of the nice big garden strawberries. The same goes for the cherries. We support regularly, year in and year out, a herd of from ten to fifteen deer, with the result that we can plant no crop on the back end of our farm that they like to eat. They also make heavy inroads into the hay. As for rats, for years we have waged a constant battle with them. In our experience, cats are the only effective means of control, but it's difficult to keep them on the job because they come out second best in contesting the right of way with the automobiles.

Most of the farmer's trouble from pests is due to unwise and unfair conservation protection measures, or to the pests being brought in from other countries. For example, the English sparrow — which destroys grain, drives out native birds, and spreads barnyard diseases — was brought to America in 1850 because some immigrants wanted familiar birds about them. They are certainly familiar enough now!

With the help of the scientists, the farmer is learning to control pests and insect diseases which attack his plants, but we don't seem to be able to do much to control the increasing number of undesirable birds and wild animals.

LET'S HAVE AN EXPECTANT FATHERS' DAY

FATHERS' DAY has just passed and I did all right. Now I am coming up with another suggestion. Why not have an "Expectant Fathers' Day?"

Looking back on my own experience, I think these "birds" rate a lot of sympathy and get very little. All but one of our babies were born in the home — and that has some advantages, for the father can keep some control of the situation. But I'll never forget how I hung around the hospital — forlorn, worried and forgotten — when the last baby was coming, until finally I jumped in the old Ford and drove it to the nearby empty horse-racing tracks on the fair grounds. Then around and around that track I drove, going so fast that Barney Oldfield would have had to eat my dust had he been racing me, unless he'd been an expectant father also.

Yes, sir, I'm for an Expectant Fathers' Day!

"FUSSY EATERS"

DID you ever consider the effect of fussiness about eating food on the young children in the family? It's very easy to fix food prejudices that will stay with the children all of their lives and that may seriously affect their health.

Dr. Rebecca Solomon of the Connecticut State Department of Health says that "fussy eaters" cannot be surprised if their children imitate those same bad habits.

I have often thought how handicapped a person is and how much he misses in good eating when there are a large number of foods at which he sticks up his nose. I am sure that if one really tries he can learn to like almost every food. For example, years ago I never thought I could drink coffee without dumping about three teaspoonfuls of sugar in it. I had to cut down on the sugar intake, and now sugar in my coffee would spoil the good coffee taste and make it seem like so much medicine.

EASTMAN'S CHESTNUT

JONES WAS SITTING with his wife behind a palm on a hotel veranda late one night when a young man and a girl came and sat down on a bench near them. The young man began to tell the girl how pretty and good and lovable he thought she was.

Hidden behind the palm, Mrs. Jones whispered to her husband:

"Oh, John, he doesn't know we're here and he's going to propose. Whistle to warn him."

"What for?" said John. "Nobody whistled to warn me!"

AA's Farmers' Dollar Guide

ATTITUDES: Many citizens are worrying about the future—about possible depression or wild inflation; about future wars, cold or hot; about the trend toward socialism or statism. Such possibilities need our serious thought, but **FEAR** without **ACTION** harms the individual without helping the difficulty.

Here are some suggestions as expressed by Jim McConnell in a recent talk: (1) One of the best ways of helping the world's problems is to do your day-to-day job to the best of your ability; (2) have a hobby and ride it; (3) enjoy your family; spend some time with them and laugh with them. After all, many of the things we worry about never happen.

INFLATION: Apparent intent of Federal government is to use all possible measures, such as deficit financing, public works, easy credit, etc., to try to prevent a decline in the general price level. Among reasons are: 1. Drop in price level brings uncertain business conditions—often a change in the party in power. 2. Prices at present level or higher seem necessary to bring in tax dollars to keep top-heavy government bureaus flourishing and growing. 3. Our present government debt would become unmanageable at much lower price level.

Future possibilities on price level trends include: 1. The general price level might be held at approximately present level. 2. Government attempts to maintain present level might fail, and a depression might result. 3. We might have continued gradual inflation.

The farmer or businessman who could predict what will happen could plan future business moves and guard against whichever of following effects might come, or at least know the effects and watch the trends:

1. A steady price level favors a normal production program and normal expansion, but discourages speculation.

2. A falling price level hurts producers of basic products such as food; it is ruinous for farmers or businessmen whose debts are heavy; it encourages selling before price drops lower rather than holding for possible price increases.

3. Inflation robs everyone, especially white collar workers whose salaries rise more slowly than prices. It encourages speculation and the owning of property rather than money. Extreme inflation also favors barter rather than cash transactions.

Outlook for year or 18 months seems to favor continued mild inflation. Beyond that, economists are slow to express opinions.

TRENDS: In discussing high level price supports, I have often mentioned that we had them in recent years when they were not badly needed, but that we might not have them when they would be needed more. That is beginning to happen.

Chances for price supports on the 1951 potato crop are dim. Long Island potato growers turned down a proposed Federal order and marketing agreement 2 to 1. Government officials are reported about ready to drop egg price supports because poultrymen did not follow government recommendations to reduce egg production. At recent meeting of National Apple Institute, John Chandler of Massachusetts said growers fear and would keenly resent government price supports on apples.

INTIMIDATION: The House Committee on Lobbying headed by Congressman Frank Buchanan is attempting to prove that any business that points out the dangers of socialism to its employees or others is thereby engaged in lobbying. Edward Rumely subpoenaed by the House Committee as executive secretary of the Committee for Constitutional Government, refused to give the Committee names of purchasers of books, for example, "The Road Ahead" published by the Committee. The House Committee on Lobbying was wrong in demanding the information and Mr. Rumely was right in refusing. This attempt to discredit and intimidate business is in line with other government policies.—H. L. Cosline.

The Song of the Lazy Farmer

ALTHOUGH the weather's blazing hot, as usual neighbor hasn't got the sense to rest until it's cool, he keeps on working like a fool. He sweats right through a scorching day, a-putting up alfalfa hay; just watching from beneath a tree makes heat rash break out all over me. I've also got some hay to mow, and some's been down a day or so; but though the former gets too tough, and while the latter's cured enough, you'll never catch me pitching hay while sun is beating down this way. I'd rather sacrifice some wealth than work today and spoil my health.

In fact, I think I'll change my plan next year and hire another man to help Mirandy grow more grain; and then, to get rid of the pain of making hay and doing chores, which any man with sense abhors, I'll sell off ev'ry head of stock, including my wife's chicken flock. That way, as soon as harvest's o'er, I'll sell my grain and lock the door and head for some palm-shaded land to spend the winter on the sand.

Of course, the farm may run down some, and neighbor's sure to call me dumb; but for awhile the farm will pay, so why not live the easy way?

ISOTOX[®]

Dairy Spray will "FLY-PROOF" your barn for $\frac{1}{10}$ ¢ per sq. ft. covered!

ORTHO AND ISOTOX, TM'S REG. U. S. PAT. OFF.

ALL OVER THE COUNTRY... dairymen and farmers are talking about results with ISOTOX Dairy Spray! Many claim ISOTOX gives the best fly control ever. Ask your ORTHO Dealer or ORTHO Fieldman and he will explain why ISOTOX Dairy Spray gives you the most economical fly protection. Or write today for free illustrated folder on low-cost ISOTOX Dairy Spray.

NO FLIES ALL SEASON AFTER SPRAYING WITH ISOTOX!

THE HOG HOUSE WAS CLEAN OF FLIES!

Meet Leo (left) and Ray Jorgensen, who farm about 280 acres, milk 40 Holsteins, have 70 feeder pigs and raise collies (cow dogs).

GOT A GOOD KILL WITH ISOTOX!

I THINK IT'S DARNED GOOD!

The James Conway & Son farm has 160 acres and 20 head of Holsteins. This is Arthur James Conway.

Here's Edward Lichter, who farms 130 acres, milks 27 head of Holsteins and has 32 head, with heifers.

ISOTOX Dairy Spray containing lindane is available as a wettable powder or liquid emulsion. Use wettable powder at rate of 10 lb. to 100 gal. water. Use liquid at comparable low dosage. Roughly, 1 lb. powder or 1 qt. liquid makes enough spray for one application in average barn. ISOTOX Dairy Spray is packed in convenient small and large sizes. It is also available as a dust.

Also controls mange, lice, ticks and many other pests. Write to nearest address below for free illustrated folder.

Contains USDA-approved LINDANE...another ORTHO first!

More Green Grass in Hot Summer Weather

By **GEORGE SERVISS**

THE spring flush on native permanent pastures will soon be gone. From then on the ladino—tall grass pastures will show to greatest advantage, although even these will not have the carrying capacity they did in late May and early June.

GEORGE SERVISS

Water, temperatures, and soil fertility all influence this slackening of growth in mid-summer. The deeper rooted plants have more moisture at their disposal since they draw from a larger reservoir of soil. Certain plants do not grow as well at high temperatures as others.

The big weakness of blue grass is the vacation it takes during the heat of the summer. The taller grasses and the legumes, particularly the legumes, are not affected to near the extent that bluegrass is by high temperatures, if water and plant food are available.

Irrigating Pastures

Except where there are facilities for irrigation, we have little control over the amount of water available for the crop. Improving the drainage would be helpful in many instances, since it makes conditions more favorable for the growth of plants and increases the depth of soil from which plants may draw water. There is interest, though, in pasture irrigation. From what I have seen of it I think it has real possibilities for the ladino-tall grass combination, but at present I doubt the economics of it for bluegrass and white clover.

In addition to irrigation, there are things that may be done to insure better pastures in mid-summer. One can include perennial legumes (ladino, alfalfa, birdsfoot trefoil) in all seeding mixtures. This automatically insures more aftermath for grazing if it is needed. There is no use seeding such legumes on most soils in the Northeast, however, unless one is prepared to lime and fertilize adequately, both before seeding and after establishment. Where ladino is the perennial legume used, early harvest of the first growth is important both for maintenance and amount of aftermath available for grazing. This practice, of course, must be started a year ahead, and is not fully effective until several such seedings have been established. Those making summer seedings this year can make a start. In the long run this is the best solution of the problem on most farms.

The second practice is the use of Sudan grass. This has to be done annually and is somewhat more expensive than the previous practice mentioned, but is much cheaper than buying grain or hay.

Mid-Summer Fertilization

The third possibility is the use of fertilizer to increase the mid-summer growth of existing hay and pasture crops. Phosphate and potash mixtures such as 0-20-20 or 0-19-19 plus borax applied after the first mowing or grazing will increase the summer and fall growth of ladino clover-tall grass mixtures, except where the fertility needs were adequately taken care of in the spring or fall, providing there is sufficient rain for growth. It does not make much difference so far as total

yield goes when such mixtures are applied, but after first cutting or first grazing will give a larger increase in mid-summer when one good bite is worth as much as two bites in the spring.

The other possibility is nitrogen on grass. Given normal rain, the tall grasses—timothy, smooth brome and orchard, will show good response to June application of nitrogen. Bluegrass will also respond, but not to as great an extent. The increase will not be as large as from spring or fall application, but the value of a pound of green pasture grown in mid-summer is considerably greater than a pound during the flush period in the spring. Where the fields will be plowed this fall or next spring or where adequate minerals have been applied, straight nitrogen materials such as ammonium nitrate or nitrate of soda may be used. If the field is to be left down for another 2 or 3 years, 10-10-10 would be better since the phosphate and potash in it will also be needed. Early September application of nitrogen to such sods will also increase the amount of fall pasturage.

—A.A.—

IRRIGATION HELPS MAKE 3 ACRES DO WORK OF 15

NEW ENGLAND vegetable growers are accustomed to unusual results obtained by intensive cultivation on comparatively small acreages. An outstanding example of this is the three acre farm of Anthony Oliveira in Seekonk, Massachusetts. He specializes in green crops entirely, all under irrigation, and the folks down that way say that he gets as much off his three

Anthony Oliveira of Seekonk, Massachusetts, at the tractor wheel, explains to his neighbor, Harold Tompson, chairman of the Massachusetts State Production and Marketing Administration Committee, his method of getting big vegetable production from a small acreage of rich Bristol County land.

acres as some extensive-type farms do from fifteen.

A good illustration of inter-cropping is his schedule on fall spinach. After seeding a fall crop 14 inches apart, he follows this by a planting of a row in between each two rows about three weeks later. Last fall on these plantings, he started cutting on the first seeding in about five weeks. The second took six weeks to harvest and, as he says, "the ground was working all the time."

Other crops include dandelions, iceberg lettuce, beets, romaine, escarole, and other greens.—Walter E. Piper.

New Vaccine for Rabies

RABIES has come to be a very serious matter in a number of central and western New York counties, and will doubtless spread to other areas. Rabies has caused serious financial loss to many farmers who have had cows or other animals contract the disease as a result of being bitten by rabid foxes. Also, many parents hesitate to allow their children outdoors after dark, or, for that matter, hesitate to go out themselves without a pitchfork or club in their hands. A rabid fox seems to show no fear and will attack anyone without provocation.

One method of control has been to require vaccination of dogs that otherwise might serve as an important step in the spread of the disease. In this connection Lederle Laboratories of Pearl River, New York, have recently announced the development of an entirely new rabies vaccine to immunize dogs. They say it is the most important step taken toward the elimination of rabies as a fatal disease since the work done by Pasteur.

The vaccine was developed by Dr. Herald R. Cox and Dr. Hilary Koprowski and was given a very stiff test before it was released for general use. All dogs that were immunized by this vaccine were completely immune to rabies even after a period of a year following vaccination. Lederle researchers predict that veterinarians will be able to immunize dogs by a single vaccination.

A dog being immunized with rabies vaccine.

A worker immunizing chick embryos with live virus, one of the important processes in producing this vaccine.

BUTTER
IS
BETTER
FOR YOU

Eat MORE of it every day...

Every year Science discovers new facts about milk and milk products. Every year Science proves what we dairy farmers have always known . . . namely, that there's priceless nutrition and food value in milk and products—*especially in butter*—that you can find in no other food.

Science has proved over and over again that *butter is better* for you. Proved that butter helps you to make the best growth gains in youth . . . that it adds vitality and beauty to the prime of life . . . and years of active living to old age.

Stop! Nature's Workshop. No Admittance!

But Science stops right here. Because Nature is a jealous dame and guards her secrets well. Science knows *what* butter does . . . but Science *doesn't know* HOW butter does it.

That's why Scientists who try to make butter substitutes, or cream substitutes, or other imitations of milk and milk products always get so far off the beam.

In their pride, they think they know everything that goes to make up an egg. But they *don't know* what puts LIFE in the egg.

By marvelous tests they separate and weigh every single chemical element in a grain of wheat. But they *don't know* the secret of the tiny wheat germ. They *don't know* what makes wheat seed GROW.

Butter Can't Be Duplicated

As one scientist has aptly said it: "Nature put something into milk that cannot be duplicated in the laboratory."

But you can bet your last dollar on it that Nature put that *certain something* in milk and butter for a very good reason. It is needed for food. And if man can't duplicate that *certain something* in a laboratory, he can't duplicate in it a factory. All the man-made laws ever passed by a legislature won't make any difference.

Dairy farmers don't need to be told the food value of milk and milk products. They see the proof in the boundless health of their own families. But now—when milk is in abundance—is the time to set an example for all to follow. Let every farm table be bountifully supplied with milk and butter, with cream and cheese, and all other dishes prepared with dairy products. Let every farmer and his wife say to their neighbors: "*Butter is better for you.* I believe it. I use it. I never permit a substitute to appear on my table."

Western N. Y. Potato Growers Cool Toward Marketing Agreement

By L. B. SKEFFINGTON

SINCE the hearing in Rochester on a proposed marketing order for upstate potatoes, there have been many rumblings that the rank and file of growers were against it. The two-to-one vote by which the order was rejected on Long Island is pointed to as an indication of what may be expected in the upstate area.

While the hearing was conducted fairly enough, it is pointed out that proponents were organized and opponents were not; also, that it was held at the wrong time, when most growers were busy planting potatoes.

Whatever the reason may be, many growers who previously paid comparatively little attention to the proposed order, are now convinced that it would be foolish to tie themselves to an order while no restrictions are applied to the Long Island crop.

After the upstate hearing concluded, it was indicated that a revised order would not be ready for a referendum until some time in July.

Backward Season

As this is written, many farmers have started cutting hay, but in most areas it certainly has not been haying weather. Low temperatures and overcast skies, with an occasional bit of rain, have been the rule. In some places hay has been baled, and in others it may be seen lying in the fields, brown and uninviting to the eye. In the meantime, on established alfalfa fields in Western New York, growth was heavy and waiting to be cut.

After a late, cold spring, pastures made an exceptionally good growth and it appears that more grass went into silos than in previous years. In our own case, at Gannett Farms, the most grass we ever put up before just filled one silo. This year we half-filled a second silo and then quit. By that time the ground was becoming very dry and growth was slowing down. We turned the cows into one field we might have cut. A post-hole digger disclosed that the soil is dry 'way down deep.

Milk Prices

At milk-price hearings in Buffalo and Rochester, dealers opposed producers' petition for a \$5.40 price beginning July 1 and \$5.80 Sept. 1. D. B. MacCollom of the General Ice Cream Company said there was too much milk, that the volume did not justify any price increase, that a larger than usual percentage was going into surplus classes.

He insisted that as farmers increase surplus production, pricing should be used to discourage the trend. Several farmers countered that as the unit price drops, they have to increase production to get more dollars to pay their overhead costs. It was pointed out that farmers, unlike dealers, are unable to pass on their costs. A point was made that part of the April 1 price reduction to producers was retained by dealers on the plea of higher costs, instead of being passed on to consumers.

Fruit Outlook Good

In the absence of official estimates, the National Apple Institute places this year's apple crop at 110 million bushels, compared to 133 million bushels a year ago. The state-federal estimate of 28 per cent fewer peaches than a year ago in New York State bears out earlier predictions of a light crop. This on top of freeze damage in Georgia and the Carolinas is expected to strengthen demand for the crop. It is indicated that the state's apple crop may be about 20 per cent less than a year ago. Straw-

berries are a disappointment in some sections this year, partly due to the effect of last year's drouth on plants.

* * *

Locusts Arrive

Definitely identified as 17-year locusts, the noisy swarming of millions of insects in Livingston County caused a flurry of excitement among nearby farmers. But Russell Parker, county agent, says he has been advised they will run their cycle without damage to local crops.

LAND BANK DECLARES DIVIDEND

The Federal Land Bank of Springfield has declared a 3 per cent dividend to stockholders of record as of May 31, 1950, amounting to \$108,218.25, according to H. B. Munger, president. This dividend, the second in the last 12 months, will be distributed to 63 national farm loan associations supplying more than 20,000 Northeast farmers with long-term mortgage credit.

All of the Bank's capital stock of

NEW YORK GRANGE BREAD CONTEST NEWS

WE NOW have the names of ten county champion bread bakers in the big statewide baking contest sponsored by the New York State Grange and *American Agriculturist*. Reports from the Pomona chairmen in these ten counties indicate that nearly 1,000 Grangers took part in local contests that preceded the county competitions.

Here are the county winners to date:

POMONA WINNERS

COUNTY	GRANGE	WINNER
Columbia	Lindenwald	Mrs. Konneth D. Fleischer
Dutchess	Amenia	Mrs. Florence McEnroe
Livingston	Caledonia	Mrs. Eugene Wyand
Montgomery	Mapletown	Mrs. Burtis Meyers
Oneida	Marcy	Mrs. Carlton Seavy
Ontario	Honeoye Valley	Mrs. Herbert R. Van Vliet
Orange	Wawayanda	Mrs. Archie Sutherland
Otsego	Goodyear Lake	Mrs. Grace M. Lamb
Schoharie	Franklinton	Mrs. Omer R. Scott
Tioga	Campville	Mrs. Elizabeth Adamek

Francis Foster of Bath, N. Y., and the trophy that was presented to him at the Diamond Jubilee Annual Meeting of the Ayrshire Breeders' Association held at Syracuse, N. Y. recently in recognition of the outstanding performance of his 100,000 lb. producer, Foster Field's Starlight. She is the 500th Ayrshire cow to become a member of the breed's lifetime 100,000-lb. Producers' Club. At seven years of age, she turned in a sensational record of 16,637 lbs. 3.71% milk and 581 lbs. fat in 305 days on twice-a-day milking.

Pomona contests will be held in 43 other counties during the summer months, and all county winners will compete at State Grange this fall in a final contest to determine who will be the State Champion Bread Maker. The winner and other high scorers will be awarded valuable cash and merchandise prizes. There will be six grand prizes, one for each of the contestants who place among the first six. These are being donated by the following *American Agriculturist* advertisers: De Laval Separator Company (food freezer); International Harvester Co. (refrigerator); Kalamazoo Stove and Furnace Co. (gas range); Knox Stove Works, Inc. (combination oil-electric or coal-electric range); and Speed Queen Corporation (electric ironer and an electric washing machine).

Also, the ten high state winners, as well as the 53 county winners, will each receive valuable merchandise prizes from these five *American Agriculturist* advertisers: American Sugar Refining Co., Cooperative G.L.F. Exchange Inc., R. B. Davis Co., General Foods Sales Co., (Certo Division); and Russell-Miller Milling Co.

Dr. Robert O. Blood, newly-elected President of the Ayrshire Breeders' Association and former Governor of New Hampshire. Dr. Blood is the owner of the Crystal Spring Farm at Concord, N. H., where Ayrshires have been bred for a quarter of a century.

\$3,607,275 is owned by these 63 local farmer-owned-and-operated cooperatives. The Federal Land Bank, in accord with one of the fundamental principles of cooperatives, returns its earnings to the users of the system to the extent consistent with sound business practices.

COMING EVENTS

August 3 is the date of the Empire State Potato Growers' Field Day which will be held at the Phelps farm near Chaffee in Erie County, New York.

August 12 is the date of the New York State Vegetable Growers' Association Field Day at one of the Cornell University farms on the Ellis Hollow Road.

A FORUM FOR Backyard Gardeners

A FRIEND wants to know how big a quick freezer to buy, if any. That's a tough question to answer, and one which depends on the size of the family, the size of the garden and your interest in gardening.

Perhaps my own experience will be a partial guide. With two in the family we have a 6½ cubic foot freezer and find it quite adequate for fruits and vegetables. Usually we come out even in the spring without a big accumulation of food that must be held over.

During the war we kept 30 hens and always had a few chickens in the freezer. The hens are gone but we buy a few from a neighbor so we have one or two handy at all times.

We have given up the idea of buying a quarter of a beef or half a pig. If we had a large family we would want to do that and we would need a bigger freezer. Now, when we buy a roast we get one twice as large as we need and put half of it in the freezer. It's handy to have it there for emergencies. Also, you can usually find a gallon of ice cream there, or rather, what is left from the original gallon.

You may not agree, but we like some things, for example, corn and peaches, as well canned as frozen. I doubt that a freezer will save a backyard gardener much money, but it will make for better eating. Whether you agree or disagree with our conclusions, let's hear your experiences.

Humus

How can I maintain the humus supply in a small vegetable garden when I seem to be unable to buy manure?

For a small area, humus can be maintained at a cost that you can afford by adding peat moss. The usual advice to maintain a compost pile is good, but most backyard gardeners cannot find enough grass, weeds and sod to keep the humus supply in the garden adequate.

Dry Weather

Recently I took part in an interesting discussion as to the reasons why the bloom on all shrubs has been unusually abundant this year.

We agreed that it was a result of last year's weather, but from there our opinions varied. I was inclined toward the idea that last year's dry weather kept vegetative growth at a minimum, and that therefore more nutrients were stored in the branches and roots.

Another idea expressed was that shrubs that had had tough going last fall responded to the challenge with an urge to survive and reproduce.

Usually the backyard gardener is tempted to leave vegetables in the gar-

The last week in May, I cut the asparagus on this plot to the ground. It was cultivated with the garden tractor and then I smoothed it with a garden rake. This helps me to control weeds.

den, where they look so satisfying, until they are fully mature. The better way is to begin harvesting some time before they are ready. In that way you prolong the season from any one planting and avoid some of the waste that comes from over-maturity.

It's a wise flower lover who has the sense of values that calls a halt before gardening becomes a burden rather than a pleasure. Always there is the

Edging a border of perennials improves the appearance of flowers and lawn. I used a half round edger to cut the sod, which was then undercut with a sharp hoe.

urge to try new varieties and more of them, and the average village lot can be cultivated so intensively that it takes most of the spare time of one person.

Resist the temptation for continual expansion, and study your flowers so they can be cared for easily. Buy what tools you want and get good ones, but steer away from fancy "gadgets."

Lilacs

Is it necessary to cut old bloom from lilacs in order to get good bloom next year?

When I was a kid on the farm we had a lilac bush older than the memory of my parents. Nothing was ever done to it except to harvest some blooms in May, yet it seldom failed to be a mass of purple blossoms.

In recent years I have usually removed the old blooms but I neglected to do so in 1949, yet we had unusually good flowers this spring.

* * *

Unless you dust with sulfur, hollyhocks will surely be affected with rust. A few puffs once a week will keep them green and healthy.

* * *

Cultivating the garden when the soil is too wet kills few weeds and tends to make the soil lumpy.

* * *

Lupines make a fine show in the perennial garden. They can be grown from seed if planted early in the summer and transplanted to their permanent location in the fall or early next spring.—*The A.A. Gardener.*

— A.A. —

FOR ANTS

Chlordan, one of the newer insecticides, is recommended for controlling ants in lawns. Its recommended rate is 1 pound of 50% wettable Chlordan powder in 50 gallons of water which is enough to treat from 750 to 1,000 square feet of lawn. Ant hills can be handled by putting a pinch of the 50% wettable powder on the hill and washing it into the hill with water.

YOU CAN DO IT WITH A FRICK-WATERLOO "BRONCO"!

This 10-hp. tractor does all kinds of work—plowing, harrowing, cultivating, mowing, bulldozing, belt jobs, etc. High crop clearance, 21½ inches! Three forward speeds and reverse. Two-cylinder 4-cycle Wisconsin engine, air cooled. Clutch, transmission, differential, brakes and steering gear are heavy-duty type. Adjustable tread, 34" to 54", front and rear. The tractor you have been waiting for. Full line of implements. See your nearest Frick Dealer today or visit your Frick Branch at Canandaigua and Amsterdam, N. Y.; Easton, Penna. or the Frick representatives at Augusta, Maine and Mt. Carmel, Connecticut.

Summer Poultry Gossip

By L. E. Weaver

Keep the Bars Up Against "Coxy"

IN SPITE of all the wonder drugs that can head off coccidiosis in chickens, prevention through sanitary practices is still the best policy. If it doesn't rain too often; if water puddles and mud are exceptions on the range, and not the rule; if the sun can get through to dry up

L. E. Weaver

damp spots quickly, indoors as well as outside; if pullets are encouraged to spread out over all the range and thus keep infection spread thinly and are not allowed to bunch up all day in the shade of one old apple tree or elderberry hedge so that droppings accumulate and infection piles up into "massive doses," if their sleeping quarters are uncrowded, airy and reasonably cool; and if plenty of good feed and clean water keep the pullets growing normally; then it is not likely that you will have to resort to sulfa or other drugs to keep them free of coccidiosis.

By this time of the year the bloody or cecal form of the disease will not often show up, but any of the half-dozen intestinal forms may become serious under favorable conditions. When one form gets a start there are often two or three others along with it. Watch the color of your pullets' legs. When you see some that are whitish when the others are yellow or orange in color, it is time for a check-up. Take a few of the pale shanked ones to your nearest poultry disease laboratory, and take along any others that look unthrifty, are not growing well, or that

have rough soiled feathers. The doctor at the lab will tell you if you should start giving the flock a medicated mash. These drugs are still plenty costly and they can add a lot to the cost of growing your pullets, but they can be a good investment if they save lives and make better pullets for the laying house.

Once in a while I find some poultryman who never has trouble with coccidiosis in his chickens. I think such men are not just lucky, they are skillful. Certainly for such men there would be no point in spending good money for medication. On the other hand there are farms on which "coxy" shows up year after year in spite of all efforts to carry on a program of sanitation. Luck could be a factor in such cases, hard luck, of course. For instance, the range might be a flat field of clay with practically no drainage. In such a case good management could still win out. Range rearing could be abandoned in favor of confinement rearing. But until the local coccidiosis-encouraging situation has been cleared up, sulfaquinolone or one of the other "coxy"-stopping drugs in the mash can head off the disease and be a godsend to the poultryman.

* * *

Good Pullets Can Be Grown Indoors

SOME unexpected surprise is always bobbing up in the chicken business. That's one of the things that makes it interesting, I suppose. Now when I have just gotten around to where I feel entirely on safe ground when I tell folks that they can grow good pullets indoors and need not leave them out on range at the mercy of foxes and dogs, my good friend, Bruce Hagen, comes into the office and tells me that the Bulkleys have gone back to range rearing. It looks as though I will have to get over to Odessa and get the story.

Allen Bulkley, Sr., was the first man

(Continued on Opposite Page)

For Greater Efficiency

small claw

The more purposes a tool can be used for, the more helpful it is to the home craftsman. Here is an idea, suggested by American Builder magazine, for adapting a standard claw hammer so that it can be used to pull small nails and tacks as well as large nails. File a small claw in the

end of one of the large claws, as shown in the sketch. The small claw also is helpful in pulling nails from hard-to-reach places.

— A.A. —

Keep the Buzz Saw Covered

My husband took an old tire and cut it along the inside so that it is open. Then he put the tire over the buzz saw. It fits well over the saw and protects it from the weather. Also, when the saw is not in use it is less of a hazard to have around where small children play. — Mrs. M. L. Blair, Worcester, N. Y.

— A.A. —

Cultivator Wheelbarrow

I have a one-wheel cultivator like the enclosed sketch that I made. As you look at it now it stands ready to cultivate. Now turn it bottom side up and look at it and you have a wheelbarrow. It makes a very handy tool about the place.

For the wheelbarrow I made a small

platform about 18 by 20 inches. This can be lifted off when not in use as a loose bolt drops down through each handle (no need of a nut). The legs attached to the handles are 19 inches long, 3/4 inch thick, and 1 1/2 inches wide. These can be bolted tightly and pulled back near the handle, but this is not necessary as they are not in the way at any time, neither do the attachments have to be removed when used as a wheelbarrow. — C. A. Bates, Oneonta, N. Y.

— A.A. —

For Extra Leverage

Extra leverage is often needed when a short-handed, open-end wrench is being used. American Builder magazine suggests that an extension handle be made for this purpose. One handle, constructed as shown in the accompanying sketch, can be made to fit a complete set of wrenches. The handle can be attached or detached quickly.

— A.A. —

Of Screws in Plaster

It is almost impossible to make screws stay in a plaster wall unless you try this trick. Put the screw in the wall then remove it and fill the hole with fine steel wool. After this is done, insert the screw in the hole again and it will stay. — Mrs. David Sprague, Paterson, N. Y.

"You Never Miss the Water....!"

(Continued from Page 1)

alone than the whole family used forty or fifty years ago. And there are millions more of us to use it!

Fifty years ago there were still plenty of woods left. The woods hold back the water. The dirt roads on the hills had "thank-you-mums" which ran the water into the meadows and saved more or less of it. Now the rain water rushes down the paved highways into the creeks and is lost. Floods of all kinds are much more numerous and worse than they have ever been because the water runs off so fast. No wonder the water supply is dwindling!

The point that most concerns us is what can be done to conserve water. For unless something is done about saving the water supply we, or at least our children, stand a good chance of facing catastrophe.

First of all, we must become more water conscious. We think of it as being free as air, but it isn't. In the cities, water rent has to be paid; in the country we pay for it one way or another whether it comes from springs or is pumped from wells.

There is some hope that scientists will learn how to control the rain supply. New York City last summer hired a rainmaker, paying him \$100 a day. He seeded the clouds with chemicals, and it did rain over the New York City water shed. But there is doubt even in the mind of the rainmaker whether or not he was responsible. Anyway, some

New York Cityites said they would pay him \$200 a day to stop, even though the reservoirs were not yet filled, because they thought the rainmaker was responsible for some of the coldest, most disagreeable weather during the first weeks of spring that had been seen in years.

I got a laugh out of the row between New York City and Albany. Albany claimed that New York City was stealing its rain clouds. I wonder what Grandpa would say to that if he could come back to the earth for a day?

Anyway, even though the rain supply could be controlled somewhat by seeding the clouds, it will be years before all the legal controversy and the exact methods of making rain this way can be resolved. In the meantime, there are several steps that farmers can take to help insure a continued and sufficient water supply.

The first of these measures, particularly if there is any doubt at all about your supply of water either now or in the future, is to study your own situation. I guess I never would have got my water problem solved if it hadn't been for the competent advice and help of Dr. B. B. Robb of the farm engineering department of the New York State College of Agriculture.

In making such a study of your water situation, first, calculate the amount of water you will need. One authority has figured that about 50

gallons per day are needed for every member of the family. Milking cows take about 25 gallons a day, a little less is needed for dry cows and young stock. Four gallons per day will take care of 100 chickens, and 2 1/2 gallons will be needed for each sheep. After you figure out the amount needed from these figures, add at least 50 per cent more for dry weather and emergencies.

If you decide to drill a well or drill from the bottom of a dug well, then the problem is how far down will you have to go to get water enough. Unfortunately, no one can answer that question for you.

Many people believe in water witching to determine where to sink a well, while scientists say it's nonsense. It won't cost you much if anything to try to locate water by water witching, but remember, even if you think the scheme works, it could locate a very small vein of water which would be entirely inadequate for your purpose. My own opinion on locating a well is to drill it where it will be most convenient. Now please don't come back at me with a hundred letters or so, as you do every time I mention water witching. Remember that I say that if you want to use the plan, it's your privilege to do so. My only reservation is, don't let your faith carry you so far that you will locate the well in an inconvenient place.

It costs money, of course, to dig the ditch and pipe the water from a spring, but once you get water running from a good spring with plenty of gravity there should be no more cost for many

years. If there isn't gravity enough to give you pressure, then you will have to install a booster pump. And here again you will need competent engineering advice to get the right kind of a pump.

This applies also to the pump you will need in your well. Consulting the pump manufacturer and the agricultural engineer may save you trouble and expense from installing the wrong kind of pump.

To save both water and soil we must give more attention to modern soil conservation measures on every farm, and especially on the side hills. Among the most important of these measures and something that can be practiced easily is strip and contour farming.

Looking forward to the future and the welfare of those who will follow after us, we of our generation who own land might well give more thought to reforestation. There are thousands of farms in these northeastern states that are wasteland and ought to be growing trees. These trees will make a valuable crop some time and, equally important, while they are growing they will conserve water.

And lastly, why not follow the suggestion of the New York State Grange and build a farm pond? On many farms this could be done cheaply and easily. Farm ponds provide water in case of fire, they can be stocked for good fishing, and can be made a recreational and beauty spot for the farmer, his family and their friends.

In any case, must we wait to miss the water "till the well runs dry?"

BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

Our White Leghorns are making high records in 1950 laying tests. In 1948-49 official egg laying tests, our Leghorns won as follows: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Pennsylvania, Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird). We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks... own two hatcheries with 530,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

GOSSIP (Continued from Opposite Page)

anywhere, to the best of my knowledge, successfully to grow pullets in confinement for laying replacements. He has a number of other pioneering "firsts" to his credit also. He was the first to import the famous "Tom Barron" Leghorns into this country. He was one of the first to make use of trap nests. He had one of the original "certified" flocks in New York State. He was one of the first to have his entire flock blood-tested to eliminate Pullorum disease; (we called it White Diarrhea in those days) and he received the first Pullorum-clean certificate issued by the State Department of Agriculture and Markets. When we at the college began to talk about "Progeny-testing" as a better method of using trap-nested stock, Allen Bulkley again was in on the ground floor. Today two of his four sons, Allen Jr. and John, are members of the firm, and they operate what used to be three separate poultry farms.

It was about 23 or 24 years ago that near-disaster struck the Bulkley Poultry Farm. It was a wet season. Water stood in shallow pools for weeks on the level, heavy clay range. The pullets went into the laying houses polluted with parasites and perhaps with one of the earliest outbreaks of what we now call leukosis. At any rate, those pullets for the most part were a dead loss.

The following season, trying to get away from infected soil, Mr. Bulkley rented land and reared his pullets on "new ground" but to no avail. Again the losses in the laying houses were terrific. But Mr. Bulkley is not a quitter. Wire floors were being suggested as a possible solution for the problem of infected range. Accepting the challenge in his typical pioneering fashion, Mr. Bulkley not only brooded his chicks on wire floors but reared them on wire to maturity. He licked the disease problem but still had to face many seasons of experimental trials before he found feeds and feeding practices that produced satisfactory results.

Little by little and piece by piece research laboratories have been fitting together the jig-saw puzzle of nutrition. They tell us that many pieces are still missing. No doubt pullets on succulent green ranges, eating vitamin-rich vegetation and insect life, and with sunshine on their backs get a few things that are not yet in the feed bags and which are therefore denied to pullets grown indoors. To that extent range-reared pullets ought to out-class those grown in confinement. However, pullets on range have the best chance to pick up parasites, and many ranges are far from succulent. My guess is that if a dozen range-reared flocks were compared with a dozen confinement reared lots you wouldn't find enough difference to be detected, either in their appearance or in the owner's pocketbook. But there could be a lot of difference in the amount of time and labor in caring for the growing birds and in the number carried off by "varmints." Now, when confinement rearing has become an accepted practice on many poultry farms, just why have the Bulkleys reversed their field? After I have visited them I may have more to add to this story.

Chickens Can Have Blackhead

WHEN blackhead is mentioned we usually think of turkeys. They have had what amounted to a monopoly of the disease for years, although it has been seen in chickens often enough that most poultry books mention the fact in an off-hand way that seems to say, "Chicken raisers don't need to worry about it." From reports I have been hearing there has been a change in the situation this year and not for the better. In quite

a number of flocks of pullets on range there have been rather serious outbreaks of blackhead. Deaths have been fairly numerous.

In one case, the outbreak occurred just after the pullets had been vaccinated against Newcastle disease. I suspect the pullets were temporarily down in condition as a result of vaccination, and the blackhead infection, which, like coccidiosis, seems to be always around, just slipped in while the door was open. Probably the same thing has happened on other farms, but vaccination is not the only thing that might be the "pre-disposing cause." I expect coccidiosis could do it, or red mites swarming over the pullets at night and sucking their blood, or just being packed into a stuffy coop with only one window on a hot night, even if there were no mites present.

The outbreak mentioned above was brought under control rather quickly. The pullets were moved to a different brooder house in a different location to get them away from the infection. It is possible that just getting over the effects of their vaccination might have been all that was needed to bring back their resistance to blackhead.

Question Box

Why is it that I can't grow head lettuce?

This is a cool weather crop, and if you sowed seed in May it is likely to be too hot and dry by the time it gets ready to head. Plant it early and give it plenty of plant food so that it will grow rapidly. For hot weather you will probably have to depend on leaf lettuce. This can be very crisp and good if you thin and transplant it in order to give each plant room to grow.

What is the best way to control worms on broccoli?

A general purpose garden dust containing rotenone will do the trick but it is necessary to dust before you see the worms. If you keep the heads covered by dusting at least once a week, you shouldn't have any trouble. The rotenone is not poisonous to humans.

When a field is seeded to birdsfoot trefoil, what if any grasses or legumes should be used with it?

Legumes should not be planted with birdsfoot. The competition is too severe. A grass is usually seeded because it helps to support the trefoil and makes it easier to mow. For hay, 5 pounds of timothy and 5 pounds of birdsfoot are often used, or 5 pounds of birdsfoot and 8 pounds of brome grass. For fields to be used entirely for pasture, 6 pounds of Kentucky Blue grass may be added.

I haven't had good success in growing rhubarb. Could you suggest what might be wrong?

Without knowing more about your problem it would seem that one of two situations exist: either you have not fertilized the rhubarb enough or it has been growing so long in one place that it needs digging up, dividing and resetting. Rhubarb is a heavy feeder and there is little chance that you will get on too much fertilizer or well-rotted manure. If rhubarb has grown well in past years and then stalks begin to get smaller, it is an indication that it should be divided and reset.

Chick Prices Cut!!

Never in our 30 years of producing baby chicks, have we given so much fine quality for so little cost to you. We hatch baby chicks every week in the year but our summer production costs are naturally lower. As a result, we pass this lower price on to you. Don't fail to get your order in now. You may never get another chance at these remarkable bargain prices. We have them in all the popular breeds and can make immediate delivery.

STARTED PULLETS

We are doing the largest volume of business in Started Pullets in our 30 years in Poultry. We have them 4-6-

8-12-16 weeks old up to ready-to-lay. That means they were last Feb., Mar., April, May or June baby chicks. So you see, you can still get early hatch birds. You have not lost a day. They are priced so low, they will cost you less than if you had raised them yourself. We have Jandies in all the popular breeds ready for immediate delivery.

STARTED CAPONS

You will never go wrong with Capons. Buying Capons now will be just right for that money-making Christmas and New Year's market. They are the economical family size bird, so much in demand today. Their meat is delicious and tender. They consistently bring highest premium prices. Once you try them, you'll always buy them. We have them 4-6-8 weeks of age in the popular breeds ready for immediate delivery.

By J. F. ("Doc") ROBERTS

AGAIN the price of milk at the farm is lower. I feel very strongly that right now dairy-men have the opportunity to correct this situation all by themselves.

Sell for meat at least some of your poorer producing cows or prospectively poorer heifers. Grade animals will now bring almost as much for meat, and in many cases more, than they will for milk.

This opportunity is unusual; seldom, if ever, has it been true before. Again, if the supply of milk is shortened up by fewer cows and heifers on farms, then the price of your remaining dairy stock is maintained or goes up, as well as the farm price for milk.

Per Capita Production Down

The fact that milk production is at a record total this year is not what it may seem. The per capita rate of milk production is below the record. More milk, but more people also. Then the margin of so-called surplus must be very small, making it unnecessary for any great liquidation of breeding stock or of the better animals.

Another situation facing dairymen is that less than half the milk produced is sold as fluid milk—the balance going into butter, cheese, evaporated, dried milk, etc. What an opportunity the new "Milk for Health" group has to increase the use of fluid milk if given the cooperation of every dairyman!

Hog prices have continued to stay up ever since "supports" were repudiated. Hog production is a much neglected field in the Northeast, particularly as we continue to grow more and more of our own grain. In Grandfather's day, every farm carried at least two or three sows; today we are approaching the same conditions which they enjoyed—namely, that again two or three sows can be a valuable and profitable asset on all of the farms in the Northeast. It looks now as if hogs would work even higher as the summer advances. If this proves true, then beef, lamb or veal may not meet their usual mid-summer break in price. Of course

next fall the supply will be greater, and some price reductions will follow, but with cheap pasture gains in weights, even this prospect does not look at all serious.

Roughage for Livestock

We in the Northeast seem to be having a good growing spring. Reports are that the Midwest and West have had a slow, backward spring. Our hay crop in western New York will be large, and a great deal of it will be in by the Fourth-of-July. That is the supreme livestock item of any year. It means that our pastures have been good and there will be feed for our long winter.

When driving around, particularly with city people, I often hear the re-

mark, "How fine the country looks!" I wonder if we farmers realize what changes have been made, since they have come about so slowly. As you ride along the crest of a hill and look out over wide expanses of valleys and other hills, have you ever noticed the changes in the size of the fields, their care, what they are producing, and all that goes into making "the country look good"—changes that mostly have come about in the last ten years or so?

Mechanical farming must be the answer. There are few eyesores. Very few fields are ever abandoned permanently, as they can be replanted in twenty-four hours. This is the step-up our land is getting, as well as the increased pace we are experiencing for ourselves.

Many Northeastern Fairs Again Offer Grass Silage Competition

NEARLY HALF of the Northeast's fairs will include grass silage in their competitive exhibits this year, according to a poll of fair secretaries just completed by *American Agriculturist*.

The idea of exhibiting grass silage was boosted along by your farm paper two years ago when, in cooperation with various organizations and commercial companies, a ten dollar prize was offered at 96 fairs in 8 states. Some fair dates were so early in the year that farmers found it inadvisable to open silos for samples, but 47% of those heard from in our survey will "keep the ball rolling," as far as grass silage at fairs is concerned.

Among those definitely planning a competitive class for silage are:

NEW YORK — Hemlock Lake Union Fair, Hemlock, Aug. 30-Sept. 2; Saratoga County Agricultural Society, Ballston Spa, Aug. 28-Sept. 2; Genesee County Fair, Batavia, Aug. 7-12; Franklin County Fair, Malone, Aug. 21-26; Chemung County Fair, Horseheads, Aug. 13-19; Wyoming County Fair, Pike, Aug. 22-25; Gouverneur and St. Lawrence County Fair, Gouverneur, Aug. 7-12; and Allegany County Fair, Angelica, Aug. 23-26.

CONNECTICUT—Wallingford Grange, Wallingford, Sept. 16; Riverton Fair, Riverton, Aug. 14-15; Durham Agricultural Fair, Durham, Sept. 29-30; and Hazardville Fair, Hazardville, Sept. 26-27.

PENNSYLVANIA — Sullivan County,

Fair, Forksville, Aug. 30-Sept. 2; Wayne County Fair, Honesdale, Sept. 12-16; and Troy Fair, Troy, Aug. 21-26.

NEW JERSEY—Morris County Fair, Morristown, Aug. 22-26; Gloucester County Agricultural Fair, Woodbury, Sept. 4-9; and Sussex County Farm and Horse Show, Branchville, Aug. 8-15.

VERMONT—Rutland Fair, Sept. 4-9; World Fair, Tunbridge, Sept. 19-21.

NEW HAMPSHIRE — The Hopkinton Fair at Contoocook, Sept. 2-4, is the only one we've heard from in New Hampshire that expects to have a grass silage exhibit.

Cash prizes, in addition to ribbons, are offered at all the above fairs, with the total awards for the event ranging anywhere from \$2.50 to \$25. Seven of the fairs offer a \$10 first prize and most of them have cash awards for the first three or four places.

Many Still Undecided

Among those undecided about having grass silage exhibits are: Union Grange Fair, Plymouth, N. H., Sept. 13-16; Northern Wayne Community Fair, Lakewood, Penna., Aug. 24-26; Chautauqua County Fair, Dunkirk, N. Y., Sept. 4-9; and the Harwinton, Conn., Fair, Oct. 7 and 8.

Fresh bog spavin? "Clear it up fast with ABSORBINE"

says C. W. Pace of Longmont, Colorado

"As soon as I see signs of bog spavin, puff or soreness on my horses, I use Absorbine. That's the treatment advised by our veterinarian, and I have been using it for over 16 years."

Yes, farmers know there's nothing like Absorbine! It's not a "cure-all," but a time-proved help in relieving windgall, collar gall, and similar congestive troubles.

A stand-by for over 50 years, it will not blister or remove hair. Only \$2.50 at all druggists. W. F. Young, Inc., Springfield, Mass.

ANNUAL MEETING AND SALE

Supper Meeting July 14 — Hatfield Congregational Church. Sale July 15 — Luther Belden's Farm, North Hatfield, Mass.

53 head of purebred rams and ewes from the top quality flocks of New England and New York will be available in Southdown, Shropshire, Hampshire, Dorset, Suffolk, Cheviot, and Corriedale breeds. Lamb is high in price, wool is holding steady, good sheep are hard to find. Give your flock a shot in the arm with some new blood from the cream of the New England flocks. Plan to take home a sheep or two that will help you produce more pounds of lamb and wool.

50 head of commercial sheep will also be available, or a total of 103 sheep. Let these sheep earn you some cash.

Annual Meeting Speaker

Prof. MALCOLM KERR, University of Maryland

REPRESENT U. S. AT ENGLAND'S ROYAL SHOW

REPRESENTING THE UNITED STATES in competition for international honors at the Royal Show of England at Oxford, England, next Tuesday, July 4, will be the Maryland 4-H Dairy Cattle Judging team. In the above picture the boys are shown getting in a little "practice judging" on a cow belonging to Blakeford Farms, located on Maryland's famous Eastern Shore. From left, the team members are David Ifert, Middletown; Donald Pickering, McDonogh School; Lambert Davis, Cecilton; and Royd Smith, Frederick. Holding the cow is Guy Harmon, Jr., son of the manager of Blakeford Farms and president of the Maryland Cooperative Guernsey Breeders' Association. This is the sixth Maryland 4-H team to represent the U. S. at the Royal Show.

THE YOUTH'S COMPANION

The Necktie Party

By ELLA BEECHER GITTINGS

BOSTON, THURSDAY, MAY 21, 1891

ONE SATURDAY afternoon in October four Swaleville boys stood on the Willamette River bridge in earnest conversation. These boys represented, at least in their own estimation, the aristocracy of Swaleville.

The eldest, a boy of seventeen, was Percy Drake, whose father kept the Drake Hotel and was a man of consequence. Ben Tyndal's father had a general merchandise store adjoining the hotel. Harvey Ballard was the editor's son. But the crowning aristocrat of them all was Clinton McKinsey, a newcomer in Swaleville.

It was his father who had mysteriously arrived in the town, as mysteriously purchased the worthless farm of a shiftless farmer named Pete Morley near by, and afterward laid it out in building lots, calling it "McKinsey's addition to Swaleville."

It had afterward turned out that he had got wind of and anticipated the building of a railroad to Swaleville, and his timely purchase made him a person of importance.

In the business development of the place which followed the news of the coming of the railroad, the improvement and embellishment of the "church-house" which served as a place of worship and general assembly for all religious denominations might have been neglected if the ladies had not taken it in hand. They began a series of fairs and festivals to raise money to paint and refurnish the unsightly building.

Swaleville had never known such a round of gaiety as it had now. At first the people gave liberally, but when all the new and taking things in the way of entertainment seemed exhausted, the "two-bit pieces" came reluctantly.

At this discouraging juncture Miss Carlisle, the popular village school-mistress, offered to help the ladies get up a "Necktie Social." It was arranged that each lady who attended should bring a lunch for two, and enclose in it a duplicate of the tie which she wore.

These lunches, put up in fancy baskets or attractive parcels of some sort, were to be sold by auction to the gentlemen. Each purchaser was then to share his lunch with the lady whose duplicate tie came into his possession.

The ladies advertised the affair at once, and the flagging interest of the people in the reconstruction of the church-house revived.

It was not only new, but it was Miss Carlisle's plan. That counted for much.

The boys on the bridge were talking of this party.

"Yes, of course we'll go," said Ben Tyndal, "only I hope the bidding won't run high. I don't want to make a very big hole in my bicycle money."

"I'll risk that," said Harvey. "Father says folks are desperately close with their money. Everyone wants to pay subscriptions to the INFORMER in stove-wood or apples."

"If I could find out which was Miss Carlisle's lunch, I'd pay five dollars before I'd let anyone else get it," said Clinton McKinsey.

"So would I," said Percy Drake. "It would be money in their pockets to let the cat out of the bag about her basket some way. There'd be some lively bidding if 'twas known."

"That's the trouble with this sort of

thing. Nobody knows, and everybody goes—all the riffraff. Fancy a fellow's having to lunch with one of the Glass girls, for instance! It takes one's appetite to think of it."

Clinton's nose went up in the air.

"Or, worse still, with Betty Morley!"

A chorus of laughter followed this suggestion. Betty was the very unattractive and very uncultured daughter of the worthless Pete Morley.

"Oh, she won't be there," said one.

"I'm not so sure of it. If she gets it through her head what it's to be like, and could make a raise of corn-bread and bacon enough for a lunch, I think she'd go."

"She might stew one of those big pumpkins in her father's late corn field. They reserved the crop when father bought the place," said Clinton McKinsey.

"Hello!" cried Ben. "Here comes Mark Grannis. Wonder if he's going, too?"

"With Betty?"

"In his overalls?"

"I say boys," said Percy, hurriedly, and lowering his voice, "I've an idea for a regular lark! It's about Mark and Betty, and the pumpkin comes in. You keep still, or else fall in with what I say, when he comes along. I'll explain afterward."

"All right!"

Mark Grannis's father was hostler and man-of-all-work at the Drake Hotel. His mother took in washing. Mark's social standing was decidedly low; but he led his class in school, and

the "upper ten" were a little jealous of the kindness which Miss Carlisle always showed him. What teacher fails to appreciate a bright and earnest scholar, even though he is clad in overalls?

"Hello, Mark! Going to the necktie party?"

Mark shook his head, and was passing on when Percy called out:

"What's your hurry, old boy? Can't you take time to be sociable once in a while? Because you beat us all at school, you needn't put on airs outside, eh?"

Mark had an uneasy suspicion that Percy was making fun of him. Still, in spite of misgivings, the unusual tone of comradeship warmed his heart.

"Why not go?" asked Percy.

"Oh, I don't know. I guess I don't want to."

"Come now, there's no use of a smart fellow like you making a hermit of himself. All the other fellows are going."

"Come now, say you'll go—just to please us!" said Ben. "We're going to try for Miss Carlisle's basket, and the lucky fellow has to stand treat. We shall not know her basket, of course. All that is to be kept secret; but we're going to guess. If it's like her, it will be the prettiest one there. Understand?"

Mark nodded, and a sudden light came into his eyes. To him Miss Carlisle was almost an angel. The thought of her wakened all the manhood in his breast.

"See here, boys," he said, bravely, "what's the use of my pretending to you this way? You know as well as I do why I can't go. I haven't money to buy anybody's lunch. Besides, my clothes aren't fit."

"Pshaw! Lots of the fellows will wear just their everyday clothes, and maybe you can earn two bits between now and Thursday."

"If I can, I'll go!"

"Sure?"

"Yes, sure. I've got two bits now, but I wouldn't like to go to a place like that with less than four bits."

"Give us your hand on it."

Mark went on his way in a strange tumult of feeling. What did it mean? Perhaps the boys were not so bad at heart as he had thought.

"Now tell us what you're up to, Percy," said Ben, as soon as Mark was out of hearing.

"What Clint said about the pumpkin made me think of it. You know how the boys bother Mark about Betty? He's sensitive to ridicule, and if you want to make him angry, ask him about his friend Betty. Now I mean to get Betty to go and take a raw pumpkin for her lunch, and we'll fix it so Mark will bid it off and get her tie."

"Will she do it?"

"I'll make the thing work some way. You'll see."

Before the boys left the bridge the details of the plot were carefully planned, and they parted in high glee.

As the last boy vanished from sight, there was a rustling in a thick clump of willows that grew on the river bank close by the bridge, and Miss Carlisle, with botany case in hand and a queer smile on her face, stepped out from their leafy cover and walked quickly up the bank.

So mysterious were the preparations that went on the next week that one would almost think Christmas was at hand. Each lady wanted to outdo her neighbor in the tasteful arrangement of her lunch, and at the same time keep her secret.

The boys' plot thrived well. Betty, through Clinton's skillful diplomacy, was induced to go to the festival and send a pumpkin for her "lunch."

As good luck would have it, Miss Carlisle gave Mark an errand to do for her in the country, for which she paid him a half dollar. It might have been pure accident that she paid him the money in the presence of Percy Drake.

Another apparent accident happened. She made so elaborate a basket for her lunch that she was obliged to take it to school to work on at recess when the pupils were out. Once, on hearing footsteps, she slipped it quickly in her desk without covering it.

A short time afterward, she sent Clinton McKinsey to her desk to get a book. He had the lid half raised when she stepped forward to intercept him. It was too late! He had seen the basket, and noted the necktie of fringed white silk which lay upon it.

There was no danger that Clinton would not keep the secret. He even went so far in his self-conceit as to suspect that she wished that he should know which was her lunch!

The eventful evening arrived. The church-house was filled to its utmost capacity. The boy conspirators sat on a front seat with their unsuspecting victim, Mark Grannis, in their midst.

(Continued on Opposite Page)

SLIM AND SPUD

Pincher Overdoes His Act

(Continued from Opposite Page)

His eyes sparkled, and his cheeks glowed with excitement, for the four boys seemed bent on nothing else than making him have a good time.

Such unwonted comradeship was intoxicating to him. He forgot all about his darned and threadbare best suit—especially after Miss Carlisle came in, and smiling brightly at the group of boys, took a seat facing them, in the "amen corner."

She wore a dress of dark blue, on which a white silk tie showed very plainly. There were white chrysanthemums in her belt, and her hair glistened in the lamplight like waves of gold—at least, so Mark thought.

He even forgot to be annoyed when Ben Tyndal nudged him significantly as Betty Morley came in. Betty was never abashed by a crowd, and elbowed her way to the front until she had found a seat as near as possible to Miss Carlisle.

Betty wore a dress of gaily flowered red print, upon the breast of which was pinned an enormous tie of green cambric.

Miss Carlisle smiled upon her also, and Betty grinned broadly. Miss Carlisle had paid her a call that afternoon, and the honor of it was fresh in Betty's mind.

Soon the bidding began. Baskets, large and small, fancy boxes and ornamental bags went off in rapid succession. As yet nothing had sold for less than "four bits," or half a dollar, and several had even brought a dollar. The ladies were elated.

When the silk-lined Japanese basket which Clinton had seen in Miss Carlisle's desk was put up, that young man, without the least caution, started the bid at one dollar.

There was a little stir in the audience. It was the highest starting bid yet made.

"One-twenty-five." "One-fifty." "Two dollars," came in rapid succession. "It is the schoolteacher's," the whisper had gone around.

At last, with flushed cheeks and a triumphant glance at Miss Carlisle, Clinton McKinsey laid a five-dollar gold piece on the auctioneer's table, and bore away the prize.

"Are you sure it's hers?" whispered Percy, as Clinton resumed his seat and rested the costly treasure on his knees.

Clinton nodded. "I know it," he said. "Well, it's about time for us to be taking in something. Let's try for the next; what do you say, Mark?" said Percy.

He saw the auctioneer's hand upon a brown paper bundle tied with red tape. The red tape had been supplied to Betty Morley for the purpose.

"Now, gentlemen," said the auctioneer, "don't be afraid to bid on this because there's so much red tape about it. Appearances are sometimes deceitful; and judging by its weight, I should say there was enough in it to feed the heaviest two people in the room. What do you say, Joe Gump? What'll you give?"

Joe Gump was six feet two, and weighed about two hundred and fifty pounds.

"A nickel," responded Joe, good-naturedly.

"Ten cents!" called Percy Drake.

"Fifteen!" said Ben Tyndal.

Clinton nudged Mark.

"Go in for it," he said. "I happen to know something about that parcel, and if I had not been after this, I'd take it in, sure. It's going cheap, too. Folks seem afraid of it because 'tisn't fancy—more fools they. Look here, boys, not so fast. Give Mark a chance."

Harvey Ballard had just offered twenty cents.

"Two bits!" said Mark half-frightened at his own voice. There was no opposing bid!

The boys in the plot were squeezing

their lips together hard in their effort to suppress their laughter. Mark had fallen into the trap more readily than they expected.

As Mark took the clumsy parcel in his hands, the tape slipped, and one corner of the stiff paper fell away, disclosing to the curious crowd a yellow pumpkin reposing on a tin platter bordered with parsley leaves!

Mark turned deadly pale. It was a cruel hoax, planned by those boys, whom he had been silly enough to trust. He had a mad impulse to turn and hurl the pumpkin at their heads; but Miss Carlisle was looking at him.

The color surged back to his face, and tearing the wrapper entirely away, he strode back to his seat, holding aloft his yellow prize with a forced laugh.

"He takes it pretty easily, but wait till he finds the necktie!" whispered Clinton.

"The necktie!" shouted some one from the crowd.

"Yes, the necktie! Show us who likes raw pumpkin."

Miss Carlisle left her seat and came toward them. The crowd fell back a little. She did not speak to Mark, but stood near. It was enough. It kept up his fast-failing courage.

Mark raised the pumpkin from the plate. No tie was there.

Percy and his companions began to feel uneasy. Had Betty been too stupid to put her necktie into the parcel?

"Hello, Mark! your pumpkin's cracked clean across," said some one.

Mark looked. It was not a crack, but a cut. A piece had been taken from the top to form a lid, and so nicely adjusted as not readily to be seen. He took hold of the stem and lifted the cover.

A shout went up from the crowd. The pumpkin had been hollowed out, lined with tissue paper and packed full of lunch; and on the very top, resting on a folded Japanese napkin, lay a dainty necktie of fringed white silk!

"The school teacher!" "The school teacher!"

The crowd took up the cry, and sent it echoing about the room.

"Three cheers for Mark Grannis!" were called for. The cheers were given with a will.

None but Clinton's fellow conspirators saw how pale he turned when Miss Carlisle's tie was found in the pumpkin, so absorbed was everyone in Mark's unexpected turn of fortune. Yes—one other saw it, and saw the look of rage that crossed his face, and the consternation of his companions when Betty Morley's green cambric duplicate bow was found inside his costly purchase. Miss Carlisle saw, and stood close by his side when he cast the green tie to the floor, saying, "I'll never do it, never! I'm going home!"

"Gentlemen don't break their bargains," she said quietly. "Every gentleman who purchased here tonight, accepted, in so doing, the conditions of the sale. Take my advice, Clinton, and make the best of what you think a poor bargain."

She moved away to join Mark and help him unpack the pumpkin.

It was a goodly store that this homely fruit yielded: Delicate sandwiches tied with blue ribbon, slices of cake, oranges, bananas and luscious grapes. Mark sat like one in a beautiful dream, listening to Miss Carlisle's cheery talk, and feeling sorry from the bottom of his heart for poor Clinton, who, in an obscure corner, was laying slices of corned beef, gingerbread and pumpkin pie before the delighted Betty, but tasting nothing himself.

In the very bottom of his basket Clinton found a card upon which was written in a hand well known to Swaleville youth:

"The best laid schemes o'mice and men gang aft a-gley."

New York Times News—3, 4, 8, 9, 10 and 11 p.m.

EVERY YEAR we get letters from readers requesting recipes for making pickles "like you can buy in a store." Then I have to explain that those pickles are cured by the long process which many home-makers are not willing to undertake. However, there is nothing too complicated about it—it just takes time and patience and a satisfactory place to keep them (the room should be between 70 and 80 degrees) while they are curing.

If you understand the changes which take place during the process, you're not so apt to do something which interferes with these changes. When cucumbers are placed in salt brine, the juice, sugar, and salts are drawn out of the cucumbers. The lactic acid bacteria also are in the cucumber, and these feed on the sugar thus drawn out. During the feeding, fermentation takes place, evidenced by bubbling of the brine. As the fermentation proceeds, the characteristic pickle flavor develops. If anything is done to disturb the lactic acid, then proper fermentation will not take place and you get poor results.

Stone crocks, enamelware, or glass containers are best because they do not impart undesirable flavors. Absolutely no metal should come in contact with the pickle solution.

Start with fresh-picked clean cucumbers—picked before they turn yellow. Wash and dry cucumbers and weigh them. A four gallon crock will accommodate 12 pounds (about $\frac{1}{4}$ bushel cucumbers) and 9 quarts of brine. Make this brine of 9 quarts soft water and $3\frac{1}{4}$ cups cooking salt, not iodized. If you want to hasten fermentation,

Photo Courtesy Corning Glass Works

ing process until they taste only slightly salty.

After this freshening process, the pickles may be eaten as salt pickles or they may be made into sour, sweet, or mixed pickles, as in the three recipes which follow:

SOUR PICKLES

For each 2 quarts of freshened salt pickles, allow

- 1 quart cider vinegar
- $\frac{1}{2}$ cup sugar
- $\frac{1}{2}$ tablespoon celery seed
- $\frac{1}{2}$ tablespoon whole cloves
- $\frac{1}{2}$ tablespoon mustard seed
- $\frac{1}{2}$ tablespoon peppercorns

Tie spices loosely in cheesecloth. Heat with vinegar and sugar; boil for five minutes. Let spices stand in vinegar overnight. Pack freshened drained cucumbers into glass jars; heat spiced

3 minutes, and complete the seal. Cool and store in a dark, dry, cool place. Makes 2 quarts.

MIXED MUSTARD PICKLE

- 1 dozen 2-inch cucumbers
- 1 pint sliced cucumbers
- 1 pint pickling onions
- 3 or 4 tomatoes
- 1 small head cauliflower
- 3 green sweet peppers
- 3 red sweet peppers
- 1 cup snap beans
- 1 cup carrots, sliced
- 6 tablespoons flour
- 4 tablespoons powdered mustard
- $\frac{1}{2}$ tablespoon tumeric
- 1 cup water
- 1 $\frac{1}{2}$ cups sugar
- 1 $\frac{1}{2}$ quarts vinegar

Vinegar and water for soaking

If salt stock is used, freshen it first and then cut. Fresh vegetables are cut and soaked over-night in brine made by

cloth to each quart of vinegar. Simmer 5 minutes. Let stand overnight.

In the morning pour off brine, rinse cucumbers in clean cold water. Cover the cucumbers with the pickling solution. If the vinegar is strong enough of spices, remove the spice bag. Let pickles stand in vinegar 24 hours—2

A truly good pickle lifts a meal out of the commonplace: Careful measuring and fastidious are important factors in the making.

or 3 days would be better. Pack cucumbers into jars and cover with a fresh boiling solution made in the same manner as above. Adjust cover and process jars in hot water bath 5 minutes. Cool and store in dark, dry, cool place.

DILLED CUCUMBERS OR GREEN TOMATOES

Dill pickles are tremendously popular, especially with young folks. The procedure need not take more than 2 to 4 weeks, provided temperatures are kept right for the process.

- 40 to 50 cucumbers or green tomatoes
- 2 ounces mixed pickle spices
- Fresh or dried dill
- 1 pint vinegar
- 1 pound salt
- 4 tablespoons sugar
- 2 gallons water

Use fresh-picked cucumbers or green tomatoes of uniform size and free from blemish. Wash them well and drain. Into a 5-gallon crock place a layer of dill and spice. Fill the jar with the cucumbers or tomatoes to within 4 or 5 inches of top. Mix vinegar, salt, sugar, and water, and pour over the vegetable. Place a layer of dill over the top. Cover with a heavy plate and weight it down to hold the vegetable under the brine. Use only enough brine to cover, for as the liquid is drawn from the vegetable the jar may overflow. Each day remove the scum that forms over the top and keep the pickles at even room temperature, about 70 degrees or as warm as 86 degrees if possible. In about 2 weeks the pickles are ready to use—crisp, well-flavored with dill, and clear throughout with no white spots when cut.

For storage, pack the cured pickles in sterilized quart glass jars, and add $\frac{1}{2}$ cup of vinegar to each. Fill up the jars with pickle brine, but first strain it, bring it to boil, and cool. Seal the jars airtight, and store in a cool dry place.

QUICK DILL PICKLES

Put 3 sprigs of dill in the bottom of each sterile quart jar; add 1 tablespoon mixed pickling spices if desired. Pack jars with washed cucumbers, whole or sliced lengthwise. Add a clove of garlic (optional) and cover with 3 sprigs of dill. Fill jars to overflowing with the following boiling solution and seal: 1 quart cider vinegar, 2 quarts water, 1 cup salt. This makes 6 quarts.

CABBAGE CHOW CHOW

- 1 quart cabbage, chopped
- 1 pint white onions, chopped
- 1 cup green sweet peppers, chopped
- 1 cup red sweet peppers, chopped
- 1 quart green tomatoes, chopped
- 1 quart vinegar
- 1 cup sugar
- 1 tablespoon celery seed
- 5 tablespoons white mustard seed
- $\frac{1}{2}$ tablespoon tumeric

Soak chopped cabbage and tomatoes separately for three hours in brine made by dissolving $\frac{1}{4}$ cup salt in 1 quart water. Drain and add the other ingredients. Boil mixture until it is clear. Pour into clean sterile hot jars and seal. Makes about 5 pints.

Pickles to be Proud of

by GRACE WATKINS HUCKETT

add 3 tablespoons sugar. Cover with a plate, and weight it down with a glass jar partially filled with water. Next day add about $1\frac{1}{8}$ cup salt, placed on the submerged plate, and at the end of each week for five weeks, place $\frac{1}{2}$ cup salt on the plate. Every few days remove the scum with a piece of cheesecloth; this permits air to get in and promotes the fermenting process.

Curing is complete when the bubbling ceases and when a cut pickle shows no white spots, but is a dark olive green in color, firm in texture, and quite salty in flavor. If the salt pickles (also called "salt stock") are not to be used at once, carefully skim. Set the container in a cool place and cover the surface of the brine with melted paraffin to seal it from the air. A better method is to pack the cucumbers in 2 or 4 quart jars, cover with own brine, and seal the jars airtight; keep in cool place until needed.

TO FRESHEN SALT STOCK

Before making into other pickles, the cured cucumbers need to be freshened. This is done by putting them into enamel pan, covering with water, and heating slowly until just lukewarm, 120 degrees. Keep them at this temperature for about ten hours, stirring frequently. Then pour off water, and taste the pickles. If too salty, repeat heat-

ing process just to boiling point and pour it over the pickles, completely filling the jars. Partially seal the jars and process in a hot water bath for 3 minutes. Complete the seal. Cool and store in a dark, dry, cool place. Makes 2 quarts.

SWEET PICKLES

For each 2 quarts of freshened salt pickles, allow

- 1 quart vinegar
- 1 $\frac{1}{2}$ cups sugar
- 1 teaspoon allspice (whole)
- 1 tablespoon whole cinnamon
- 1 teaspoon whole cloves
- 1 tablespoon mustard seed

Add spices tied loosely in cheesecloth to vinegar and sugar. Boil 5 minutes. Allow to stand overnight. Soak freshened salt pickles in a mixture of 1 part water to 3 parts vinegar from 4 to 6 days; drain off and discard. Then soak the vegetables in sweet pickling vinegar 4 or 5 days. Drain off this pickle solution, and to each quart of it add one to $1\frac{1}{2}$ cups of sugar and bring just to the boiling point. If all the sugar is added at first to the vinegar, the pickles will shrivel. Pour the sirup over the pickles and simmer for 5 to 10 minutes; set aside for 2 or 3 days before packing.

Pack pickles into glass jars; heat the liquid to boiling point, pour over pickles, completely filling jars. Partially seal jars, process in hot water bath for

dissolving 1 cup salt in 4 quarts water. Rinse and drain. Cover vegetables with equal parts vinegar and water and let stand 3 or 4 hours. Drain well. Mix flour, mustard, and tumeric with water; stir until smooth; add sugar and vinegar, and cook until sauce thickens. Add vegetables and simmer until vegetables are hot. Pack into hot clean jars and seal. Makes about $3\frac{1}{2}$ quarts.

QUICK CUCUMBER PICKLE

Wash, weigh and soak clean fresh cucumbers overnight in a brine made by dissolving $\frac{1}{2}$ cup salt in a quart of warm water; weight down so cucumbers are held under the brine. One quart of brine covers 2 pounds of cucumbers. A peck of cucumbers weighs about 12 pounds; therefore, make 6 quarts of brine or pickling liquid to cover a peck of cucumbers. A peck of cucumbers will yield about 8 quart jars of pickles.

Make a vinegar solution using $\frac{3}{4}$ cup sugar and 3 tablespoons whole mixed spices tied loosely in a cheese-

Knitted Sunsuit

Little girl sunsuit No. 2170 requires 3 skeins of Bear Brand Super-Spun Nylon to make in sizes either 2 or 4 years. Also a few yards of yarn of any kind for the embroidery which is done after the suit is knitted and in a duplicate stitch. It is a one-piece garment and worked in a stockinette stitch of knit-a-row, purl-a-row with a seed stitch border. This particular yarn is anti-shrink and moth proof, yet very soft. It comes in one skeins of lovely pastels as well as the deep tones.

The instruction sheets will be mailed free to you upon receipt of your request and a stamped, self-addressed envelope. Send to Embroidery Department, AMERICAN AGRICULTURIST, 10 North Cherry Street, Poughkeepsie, New York.

TODAY IN Aunt Janet's Garden

AS I write this during the second week in June, the beauty of the flowering shrubs and perennials is almost beyond description. Due to the lateness of the season, many of the earliest flowering ones and the later flowering ones bloomed at the same time. Hence we have had blooming all at once native dogwood, lilacs, azaleas, rhododendrons, and, as they fade, on come the Korean snowball and Paul's Scarlet hawthorne.

Pansies are at their best—hot weather makes them sag a bit!—irises are popping open every minute, and, just a week or ten days behind schedule, comes the first peony blossom, that of officinalis rubra, the old-fashioned "piney." Other peonies are in fat bud.

These peonies were all divided in the fall of 1948 during a very dry season. This meant that they did not get roots established well enough before freezing weather to do well last year. Hence their blooming this season is awaited with curiosity and some anxiety.

Perennial phloxes are thriving. True

I had to replace some of the seedling phlox plants which flowered so in the border, as they completely spoiled my color scheme. The replacements were Mary Louise, a fine white, and Salmon Glow, a beautiful salmon pink, which I had years ago, but which were somehow lost.

The annual sweet alyssum which edges the border reseeded itself nicely and is now in blossom. This gives a sort of lace-edge finish to that border.

In the wake of all the blossoming comes the removal of all "deads." This is not wasted time, for if left on, the plant proceeds to make seed; this consumes strength which should go into the plant rather than into unwanted seed pods. Then too comes the pruning of the forsythia and other early spring blooming plants—not the round-headed shearing of shrubs that I see so often, but the judicious clearing out of old wood, which gives a more natural effect. It is easy to tell which branches to remove because the oldest ones have the darkest wood; they should be removed just above the surface of the ground.

In the case of lilacs, just clipping off the old heads is usually sufficient. With azaleas and rhododendrons the old flowers can be pinched out from between the two new leaves starting at the tip of each branch.

Bulb foliage is anything but attrac-

tive now. I help to hide it by winding it around my finger and laying it down behind plants that will blossom later. To remove the leaves before they have cured completely might mean a loss of next year's blossoms.

—A.A.—

"FUN BOX" FOR CHILDREN

A "FUN BOX" is easy to make and is just the thing to bring out when a little friend is ill or when someone comes to play at your house, or even on a rainy day when the children get bored.

First of all, get a medium sized box and decorate it on the outside. This can be easily and quickly done with crayons. Mark in big letters on the top or sides: FUN BOX.

Inside the box put little things that a child can play with: Bits of ribbon, yarn, bright colored papers, postcards that can be cut into puzzles, bright colored pages from seed catalogs, colored linings from greeting card envelopes, paper dolls, tinfoil, a blunt pair of scissors, crayons, empty powder boxes or tiny boxes of any kind, colored beads, shells, or any other odd things that will please a child. Children especially love the surprise element of the "Fun Box."

—Marion E. Hastings, Windsor, Vt.

Sun Specials

No. 2535. This wearable cap sleeve dress has a fitted and collared bolero jacket to turn it into a go-everywhere costume! Sizes 12-20; 36-46. Size 18, 5½ yards 35-inch fabric for the dress and bolero.

No. 2159. Make this dress sun-back style—and make it again with a contrasting yoke cut-in-one with cap sleeves. Sizes 10-20; 36-40. Side 16, 3¾ yards 35-inch; with yoke, 3¾ yards 35-inch with ¾ yard 35-inch contrast.

No. 2215. One of the most flattering washables of the season—and one that takes almost no time at all to make! Tucked waistline. Cropped kimono

sleeves. Sizes 12-20; 36-48. Size 18, 3¾ yards 35-inch fabric.

No. 3533. Pocket edition sunsuits for brother and sister—both in one pattern! Sizes 1, 2, and 3. Size 2, 1½ yards 35-inch fabric for the girl's sunsuit; and ¾ yard 35-inch fabric for the boy's version.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 20 cents for each pattern wanted. Add 20 cents for our new Summer Fashion Book which has pattern designs for all ages, all sizes, all occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, New York.

Without Painful Backache

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

SEW AND SAVE—Fresh new fashions for warm days, with emphasis on smart simplicity that makes for easy sewing. Over 150 practical designs for every age and every occasion, the most complete collection you'll find in any pattern book.

Send for your copy now. Price, 20c. Order from AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

PRESENTED on this page are some pictures which report more faithfully than I can with words on three experiments we are trying at Sunnygables this summer.

Grazing Spring Growth

The first and largest of these pictures shows the results of an experiment which seems to have worked out quite successfully. In it you can see a five-year-old stand of brome grass and alfalfa being cut for grass silage on June 5. There is nothing remarkable about this, *except that it is the growth left on a 10-acre field after 21 Brown Swiss cows had grazed it nights and an occasional day throughout the entire month of May.*

The stand is full of alfalfa which the cows scarcely touched. If you look carefully, you may be able to see it.

From our experience with this field during May, 1950, we shall certainly have no reservation in the future about grazing the spring growth of meadow stands of grass and alfalfa.

— Photos by C. Hadley Smith

Kernels, Screenings & Chaff

By
H. E. Babcock

In an endeavor to set up Jack Conner at Sunnygables with a completely mechanized outfit for making grass silage, but one in which he invests a minimum of money, we have gone back to our 12-year-old Stewart dump truck and a heavy duty hay loader for picking up the grass and hauling it to our trench silo, where we are storing it unchopped.

Years ago we learned that one man, the truck driver, could build a big load of grass on a truck with a hay loader by stopping about three times and tipping forward the pile of grass which the loader built up.

This is a completed load of grass. Note that it is built heavier on the rear end, where the hay loader puts it anyway, to aid in tipping the platform of the truck when the catch that holds it down is released. It takes about ten minutes for a man to put on a load of 5,000 pounds of grass by this method.

This picture shows how a truck load of green grass is dumped into our trench silo without chopping it. This year we began filling the trench at the high end, and have backed over the grass as it has been dumped in with full loads to pack it. *It is important to recognize that we are aware we are taking a lot of chances testing out this cheap method of making silage.* If it turns out that the stuff is no good, we will faithfully report the fact. Up to the present time, we have \$250 invested in the trench, including the concrete runways through it. On the sides of the trench, we are putting some strips of rubber film (not shown). We are testing them to see if they can be used to protect the walls of the trench from heavy rains, and the thawing and freezing breakdown after the silage has been removed.

More and more northeastern farmers are installing complete or partial irrigation systems. A post card addressed to the ALUMINUM COMPANY OF AMERICA, Pittsburgh 19, Pa., or the coupon on page 11 of the June 17 issue, will bring you a copy of the booklet called "Pipe Lines for Profit."

THE DOW CHEMICAL COMPANY, Midland, Mich., has announced that it will offer a new 20% emulsifiable formulation of lindane this season. Lindane is the chemical fly killer which the United States Department of Agriculture approved for use in dairy barns during 1949.

The BEACON MILLING COMPANY of Cayuga, New York, announces the election of Stanley W. Tyler as president and Floyd Riford, who has been president since 1936, as chairman of the Board. Mr. Tyler has been with Beacon Milling since 1924. In 1943 he was vice president in charge of production and purchase, and has been vice president since 1947.

THE NEW HOLLAND MACHINE COMPANY, New Holland, Pa., has recently announced an augur-type ferage blower with retractable wheels which ends the need of digging to lower the machine for use. It can be placed so that the table is 22 inches from the ground.

One of the interesting exhibits of the International Baby Chick Association Exposition was a group of acrobatic baby chicks. Encouraged by a hopper of "LARRO CHICK BUILDER," the chicks walked up a 24-inch incline in a single file; the leader sampled the feed and then was pushed over the edge by the next bird and lowered gently to the cage floor by a counter-balanced platform. The cycle was continued until the chicks were no longer hungry, then they were removed and ten new-comers were substituted.

Many housewives will be trying the recipe for spiced peach jam. It appears in the CERTO ad on page 25 of the June 17 issue.

THE SECURITY MANUFACTURING AND CONTRACTING COMPANY, Burlington 34, Wisconsin, boasts that lightning has never destroyed any building fully protected by the Security system. They will be glad to send you the full story on request.

Here is the new "jet action" toy car which is being given to customers in many service stations selling the new "jet action" Tydol-Ethyl gasoline. The balloon furnishes the power to get up surprising speed for a surprising distance on a smooth surface. The balloon is replaceable. The toy is making a hit with parents as well as youngsters.

SERVICE BUREAU

By H. L. Cosline

Subscriber's Alertness Brings a Reward Check

ON FRIDAY evening, April 14, James T. Tallman, Route 1, Columbus, N. J., was returning home with his wife from a shopping trip. He noticed a car parked behind his milk house and at first thought it was one of his neighbors. Then he decided it was no one he knew and became suspicious. He sent his wife in the house to call the Bordentown State Police, and stationed himself in the lane to catch them should they drive out. They came out all right—about forty miles per hour. Although Mr. Tallman was nearly

tenced to serve from one to three years in the New Jersey State Prison. Our congratulations to Mr. Tallman, Detective Bolen, and other State Police who worked on the case, and the Judge—all of whom cooperated in seeing that justice was done. Below is a reproduction of the check which went to Mr. Tallman.

The story might well end here, but Davidson was destined to make even more news. While confined in the county jail, he helped another prisoner to escape. The fellow who escaped later

knocked down, he did manage to get the license number.

The State Police arrived shortly after, and Detective A. R. Bolen discovered that there were chickens missing. Similar thefts had been reported by other farmers in the vicinity, but there had not been sufficient evidence to enable the Police to run down the thief. This time it was a different story. Thanks to the promptness of Mr. Tallman, Detective Bolen made short work of catching and putting in jail Floyd Davidson of New Castle, Del. Davidson pled guilty, and on May 22 he was sen-

gave himself up to the authorities. Davidson was then charged with aiding and abetting the escape, and was given another one- to three-year term in State Prison. He was going to make the break with the other prisoner, but he couldn't get through the small opening. Maybe he ate too many of the chickens he stole from various Burlington County farms, although he claimed he sold them to diners and restaurants in Pennsville for \$1 apiece. He said he needed the money to keep up payments on his truck which he used in a hauling business.

HOUSE DAMAGE

You have helped us before. Now I have a real problem. We hired a man to take care of things while we were away. He agreed that he would be responsible for looking after things. Instead, he completely ruined a hot water heater, damaged a milk cooler, and ran up a huge telephone bill which we had to pay. Many things in the house are missing and damaged, and the house was very dirty when we returned. Is there anything that can be done? The Personal Finance Company is trying to collect money they loaned him.

So far as I can see from your letter, there is no basis for any criminal action unless you could definitely prove that some things of value are missing and that he took them when he left. It appears from your letter that he has no financial responsibility or desire to pay; and it would seem, on the basis of your letter, that you would be wasting time and money to sue him for damages done. It may not be much consolation, but it could have been worse. He might have burned the house down.

— A. A. —

SHORT WEIGHT

Recently a poultry dealer came to my farm and offered 29c a pound for some fowls. On the basis of the weight of some birds sold just four days previously which averaged 5.63 lbs., they should have brought me a total of \$326.54. However, when the dealer weighed them and paid me, he figured it at \$240.41. We didn't realize until he had gone that we had been short-weighted. Then we followed him to a neighbor's, and he gave us \$32 more, but we were still \$54 short. We would like to bring him to justice.

We are very sorry, but it is too late now. If you had notified the State Police immediately and had been able

to identify your fowls and have them weighed, you would have had a case.

I do not doubt your story because it has happened many, many times. Clever operators can give you short weight even though their scales are adjusted correctly. Always do some figuring to arrive at the approximate weight of birds you have to sell, and notify the police immediately if you are short-weighted. A few poultry buyers are always on the lookout for some trusting soul who will not question their figures.

— A. A. —

NOT LICENSED

Practically every mail brings letters to the Service Bureau inquiring about insurance companies. A great many of these inquiries are a result of literature received through the mail by subscribers. We are glad to check as to whether the company in question is licensed to do business through agents by the Department of Insurance in the state from which the inquiry comes. If it is, we tell the subscriber that he should have no fear about taking out a policy.

Anyone who is insured in a licensed company is protected by the insurance laws of the state which regulate such matters as policy forms, investments and other insurance operations. In case of a disputed claim, the services of the Insurance Department are available to a policyholder.

The fact that a company is not licensed does not necessarily mean it is not reliable. However, we feel it is a good idea to play it safe and deal through agents representing licensed companies. Unlicensed companies can solicit business by mail, but not by resident agents.

THE FARM PAPER OF THE NORTHEAST

IN ORDER that you might have a cross section of opinion of northeastern potato growers, we requested growers from all sections of the Northeast to comment on price supports, marketing agreements, and on the long-time outlook for potato growers. But before we give you their comments, let's review some factors which have an important bearing on the present potato marketing situation.

1 There has been dissatisfaction in some potato-growing areas over acreage allotments. Telling growers how many acres they can produce is a risky business. It is very difficult to make such allotments in a manner that is absolutely fair.

2 Some time ago Congress said in a resolution that price supports would not be available for the 1951 potato crop unless marketing quotas were established. But Congress has taken no steps to pass legislation requiring marketing quotas, and the natural assumption is that price supports will not be available after this year's crop. Incidentally, if marketing quotas are established and voted on favorably by potato growers all over the nation, each grower will be told how many potatoes he can market and will have a stiff penalty to pay if he markets in excess of his quota. If that should come to pass it would be real control, much tighter than anything yet experienced.

3 Consumer reaction to price supports for potatoes has been progressively more unfavorable. Gradually growers have realized

Where Do POTATO GROWERS Go From Here?

that consumers can't be blamed too much when year after year more potatoes are grown than consumers require, and when year after year large sums of taxpayers' money are used to support prices. More and more growers admit that price support at present levels cannot be continued.

4 Marketing orders and agreements are required this year in areas where the Secretary of Agriculture states that such an order is necessary if producers in those areas are to get price supports for the 1950 crop.

Growers in areas not so designated by the Secretary continue to get supports without the necessity of complying with a marketing order and agreement. Such orders and agreements regulate the volume of potatoes

**Farmers can grow 'em but how
are they to be marketed?**

going to market by requiring that potatoes of only certain sizes and grades be sold. Producers have an opportunity to vote, and two-thirds must favor it before a marketing order and agreement become effective. So far Kern County, California, and Long Island have voted "No" on such an order and agreement. Growers in western New York will vote soon, and the chances that they will vote "No" are considered greater than before the Long Island results were announced. New Jersey growers recently voted "Yes," while Maine growers have been under an order and agreement for two years and will continue unless there is a demand for another vote.

This brief history may indicate some reasons why Long Island growers have turned down the marketing agreement. Now let's see what growers from the Northeast have to say about the situation:

"Let's Do It Ourselves"

"I believe the sooner the government gets out of the potato business, the better it will be for the industry as a whole. I doubt if any potato acreage controls can be made to work fairly or satisfactorily.

"Demand for potatoes will probably continue at about present levels. It can be somewhat increased by getting them to consumers pared and washed, canned or precooked, so that less effort is required to prepare them for eating; by growing better varieties; by

(Continued on Page 10)

G.L.F. 16% DAIRY FOR SUMMER FEEDING

ALONG about this time every summer, when the days really get hot, pastures begin to dry up and cows become restless. The heat, flies and lack of lush pasture all add up to lower milk production. When production starts to fall off and you have to increase feeding, G.L.F. 16% Dairy Feed is a practical pasture supplement to use.

The difference between the feed supplied by excellent pasture and that furnished by poor pasture is enormous. The cows have to walk a long way and graze steadily, and still can't get enough to eat. A 1000 pound cow capable of producing 40 pounds of 3.5% milk per day will have difficulty getting enough feed from poor

pasture to produce about 15 pounds of milk. She may continue to produce more than that without grain, but she will draw on her body for the additional nutrients.

G.L.F. 16% Dairy fed to cows when pastures are dry will help reduce the amount of the production drop and keep cows in better condition for fall. The 16% protein level is sufficient because cows will receive additional protein from the pasture.

Molasses in the Pasture

Molasses feeding as a supplement to pasture is proving to be an economical means of holding up the Total Digestible Nutrient intake needed.

It can be fed in shallow troughs, gravity fed from the drum, added to the grain fed at milking time or fed in the manger.

Cooperative G.L.F. Exchange, Inc., Ithaca, N.Y.

New 1950 G.L.F. Residual Barn Spray

Flies add much to the discomfort of cows during July and August and actually affect milk production. G.L.F. Barn Fly Spray contains Lindane in Oil which makes it an effective killing agent, lasting from four to six weeks. It is economical to use, one quart of concentrate makes 25 gallons of spray.

G.L.F. Feed Services for Dairymen

JOHN CASTROGINI— Star Farmer of America

By HAROLD DONOVAN

Teacher of Vocational Agriculture, Montrose, Pa.

THE little town of Montrose, Pa., with its starched white houses and lush green shrubbery, received a pleasant jolt this year when one of its natives was honored with the Star Farmer award. John Castrogini received the award for the North Atlantic Region, one of four young farmers throughout the United States who got this recognition for their hard work and efficiency as former students of high school vocational agriculture.

John lives on a 225-acre farm three miles outside of Montrose. He owns fifty-one head of Holstein cattle valued at \$9,500. He is twenty-four years old and—for the benefit of all feminine readers—he's single and personable.

Land of Opportunity

He is next to the youngest of a family of six children. In 1911 his parents, Alberto and Josephine Castrogini came from Sicily and, as you might expect, they speak broken English. Life in the old country is different from life in the land of the free. In Sicily the average family owns from three to fifteen acres, and the larger the family the more land they will need. The climate is warm—too warm, for it stifles people's energies, and so the land is handed down from one generation to another with no changes or improvements. In those days, John's father told us, when a man needed a pair of shoes and had no money to buy them, he went to work for one of the rich barons who owned vast portions of the land. It was a poor way of eking out an existence, certainly not like the life Albert and Josephine Castrogini enjoy now.

Don't think for one moment that they are wearing out the rocking chairs on their comfortable, shaded front porch. Not at all. They work hard. So does John. But at least in this country there is room for individual initiative and a chance for a man to get ahead.

Establishing Credit

Like many others, John started his farming on a small scale. In grammar school he made a profit of \$300 and put this money into poultry and swine, his first project. Occasionally after this he borrowed money from the bank, but was always careful to pay it back within a few months, thus establishing good credit at his local bank. John entered the Montrose High School the year this country entered the second

World War. Four years later he graduated with highest honors.

In his freshman year at high school John made a labor income of \$164.98 by carrying two projects, poultry and swine. The second year he tripled the number of hens from 200 to 600. At the start of his schooling, John had his mind set on dairy production. During his sophomore year he bought three dairy calves, rented land from his Dad and raised oats and corn. During his junior year he decided to discontinue the swine, but stepped up the poultry to 1,000, increased his dairy holdings from 3 to 13, and also his acreage of oats and corn. In his last year at school, John took over the farm. By this time he had 19 cows, 22 head of young dairy cattle, 300 poultry, 36 acres of hay, 16 acres of small grain, 15 acres of corn and soy beans, and his net profits rose to \$3,108.

Adopting New Practices

As he learned new ideas in school, John made innovations on the farm and, although it wasn't always easy, convinced his Dad of the soundness of certain changes as he went along. For instance, he signed up with the Soil Conservation Service to test the soil and to set up diversion drainage ditches and contour strip farming. He introduced artificial insemination in the herd of 8 cows, dug a small pond for fire protection and water for the cattle, introduced calfhood vaccination for Bang's disease, and inoculated alfalfa seed. It might be well to point out that Albert Castrogini had never heard of any of these practices and naturally was skeptical of their value.

Judging from his record books, John must be on the right track. In his first year out of high school, his farm profits jumped to \$3,564; and last year, 1949, he netted \$5,031. In addition to the original 180 acres of land, John rents additional land. Contrast these acres of land with the 15 in Sicily and you can well understand why the mother and father are proud American citizens. Gradually over the years, Mr. Castrogini has added farm machinery until the farm has all modern equipment. Mechanized farming means more efficient farming, and John is fully aware of that.

Under the present arrangement, John's parents have deeded the home farm to him in return for a \$10,000

(Continued on Page 11)

THE EDITORIAL PAGE

KICK THEM OUT!

MY FRIEND, E. S. Bayard, Editor Emeritus of the Pennsylvania Farmer, tells about a letter that Thomas Jefferson wrote, when he was traveling in France, to James Monroe, who later became President of the United States. "How little," Jefferson wrote, "do my countrymen know what precious blessings they are in possession of and which no other people on earth enjoy."

Almost every American forced to stay in the Old World for any length of time becomes intensely homesick and longs to see the Statue of Liberty and all that it stands for more than anything else in the world. How strange it is, then, how sad, that so many of us don't realize or appreciate the blessings of liberty and are willing to sell them one by one for false security, for a security paid for out of our own pockets, for a mess of pottage!

Benjamin Fairless, President of the U. S. Steel Corporation, told a Congressional Committee recently that the radicals and the theorists, the "do-gooders" would, if they had a chance, turn back the clock of progress and would "squeeze a modern, dynamic, efficient America into the puny production patterns of its industrial childhood, or by subjecting American productive enterprise to the deadening hand of political economic philosophies that have led most of Europe to desolation and despair. They would substitute governmental regulation for competition, and political pressures for customer control."

If you need any proof of what our way of business and of life mean in this country, listen to this: The United States Labor Department says that at prevailing prices one pound of bacon would cost the average workman in the United States 30 minutes of work; in Australia, 40 minutes; in Canada, 45 minutes; in Great Britain, 53 minutes; in Sweden, 69 minutes; in Ireland, 96 minutes; in Switzerland, 113 minutes; in Poland, 135 minutes; in Hungary, 192 minutes; in Russia, 466 minutes. Moreover, in many of those countries you cannot even get the bacon at any price.

I sometimes wish that all the traitors, the radicals, and all others who are always bellyaching about America and who want to fasten Old World schemes on us, could be kicked out forever from this country and never permitted to return. Then it wouldn't be long before they would have something really to complain about.

ARMY WORMS ON THE MARCH

ONE time when I was a small boy I lifted a bundle of unbound oats which had been left by the drop reaper and was horrified to see the ground under the bundle entirely covered with a mass of nasty, wriggling worms. They were army worms.

The memory is recalled by the fact that Hugh Cosline, just back from visiting farmers in southwestern New York, reports that army worms are on the march again. One farmer told Hugh that the worms had left only a few leafless stalks in a field of seven acres of corn. Word comes also from central Maine of considerable damage caused by the worms there.

The worms are first noticed in hay, and while there are some few fields badly damaged, the most serious effect comes when the hay is cut. Then the worms migrate by the millions to the nearest corn or oat field. Farmers are controlling them by plowing furrows around the cut hay fields and by putting chlorodane dust in the bottom of the furrow to keep the worms from getting out. To make doubly sure, another furrow is plowed around the outside of the first furrow.

MODERN MIRACLE

ONE TIME at the county fair when I was a boy I paid 10 cents to get into a sideshow to have a couple of tubes stuck into my ears. If I listened carefully and used a lot of imagination, I could hear some faint sounds that resembled music. No, that wasn't the first radio; it was the first phonograph, and it shows how far we have come in the methods

By E. R. Eastman

of communication in a comparatively short time.

I bring the subject up now because the other day I had my first experience in a television studio, on Station WNBF in Binghamton. The occasion was the annual meeting of the Associated Industries of New York State, and I was asked to say a few words about the need of better understanding and cooperation between industry and agriculture.

The television studio was ablaze with bright lights which were a strain on the eyes. I was seated at a table before a microphone with Mr. Albert Osborne, who in the course of a news broadcast asked me questions on the above subject. While we were talking, photographers operated huge moveable cameras, taking pictures of us at different angles, and as they took the pictures we could look across to a screen at the other end of the studio and see ourselves as we appeared to the television audience.

Sometimes one hears people without faith expressing doubt about the miracles that happened in Bible times. Miracles are always happening only we are not wise enough to recognize them. Nothing could be more miraculous than a speaker talking into a little instrument like a telephone, and having hundreds of people hear his voice and see his face in their homes many miles away.

TO STAY IN THE GAME

SOME progress is being made by northeastern farmers in cutting the costs of producing milk. Some farmers are improving their pastures, growing and making better hay, and there has been a 5% increase in the last few years in the amount of corn for grain grown. But we have only started.

With hybrid varieties it is much easier to mature corn for grain now, and where more hay is grown per acre and more is used for grass silage, there is more land available for the grain crops. When corn growers learn what potato growers have known for a long time, about the use of heavy applications of fertilizer, there will be a larger increase in grain corn production. I have seen hill land where I helped to grow 150 bushels of potatoes years ago that produces now 400 to 600 bushels. The increase is due chiefly to the larger use of fertilizer. Conditions will vary, of course, but on the average 500 pounds of 10-10-10 fertilizer broadcast, with 100 pounds more used as a side dressing, will pay in increased yields of corn. Of course, the soil must also be in good condition.

Jim Hall, our Field Editor, reports that one farmer who gets high production from his dairy grew enough of his own feed and improved roughage so that his purchased feed costs were only 7c

Here are, from left to right, Dr. R. B. Becker of the University of Florida, President of the American Dairy Science Association; Dr. L. A. Maynard, head of Cornell's School of Nutrition; and Dr. G. M. Trout, retiring President of ADSA, of Michigan State College, drinking milk from the new milk vending machines recently installed on the Cornell campus. Both plain and chocolate milk are offered.

It is to be hoped that the experiment proves successful, for if it does, milk vending machines can be put in hundreds of public places and can become a real factor in increasing milk consumption and improving health.

on a hundred pounds of milk.

To stay in this hard, competitive game of producing milk I am sure that we must pay more attention to improving the pastures, growing better hay, supplemented, if possible, with grass silage, and by keeping the feed costs down. What do you think?

SUGGESTIONS WANTED

THERE must be someone among our readers who has found an effective way to control woodchucks. This spring we sowed about a quarter of an acre of peas broadcast. They came up thick enough so that we would have had plenty of peas for the large amounts we need for freezing and to supply two other families, but in spite of all we could do, woodchucks cleaned them up. We'll have hardly enough peas to eat during the season, and none to freeze.

We have bombed the nearby holes several times, but the chucks either dug out or else new ones moved in and dug new holes. I have considered putting a hose on the exhaust pipe of the automobile and running the hose down the holes, with the idea of killing the chucks with carbon monoxide gas, but some of my friends say that would do no good. As you know, woodchucks have both a front door and a back door. In addition, they have from one to several dead-end chambers leading off from the main passage. It is my opinion that when anything disturbs the chucks, they retreat into these side passages, and therefore many of them escape the poisonous gases from a bomb or automobile exhaust.

So far as our own experience goes, the woodchucks are on the increase. Their holes are a hazard to machinery in the fields, they destroy a lot of good grass, and there ought to be some effective way to get rid of them. If you have been successful in eliminating woodchucks won't you please tell us how you did it in a short letter, and we will pass the information on to thousands of farmers who are annoyed by these pests.

WHAT DO YOU EAT FOR BREAKFAST?

THE above title is the subject of an excellent article that appeared originally in the Christian Herald. It pointed out that breakfast is just about the most important meal of the day.

Experiments with a large number of persons showed that workers who skipped breakfast or ate a very light one soon had a slump in their production and couldn't turn out the amount or quality of work of those who had had a good breakfast. A large number of workers who were injured were found to have come to their jobs without breakfast, and therefore became overtired and careless.

From a health-standpoint the best breakfast consists of fruit, cereal, eggs, toast and coffee, with plenty of milk on the cereal or even substituted for the coffee. And there should be time enough to eat that good breakfast without grabbing it on the run.

EASTMAN'S CHESTNUT

VERMONTERS have a dry style of humor all their own which has always intrigued me. The late Dean Carl Ladd used to love to tell the story of the old farmer in Vermont who was sitting on his front porch one day rocking vigorously when a neighbor came along the road with his horse and buggy.

"Howdy, John!" said the neighbor. "How be ye?" John stopped rocking for a moment to spit expertly over the railing of the porch, and answered: "None of yer durned business! Then he added: "Wouldn't 'ave told ye that much if ye hadn't bin a neighbor!"

Another of Carl's favorite stories was about the hired man in Vermont on Saturday night who met a friend on the road. Said the friend:

"How be ye, George? Where you goin'?"

And George answered:

"Goin' to town to git drunk—an', Lord Almighty, how I hate it!"

AA's Farmers' Dollar Guide

MILK: Expected June uniform milk price in New York market is \$3.20. Earlier, there was fear that June price might go below \$3.00. Beginning in July, prices dairymen get should trend upward.

U. S. average milk production per cow was 5,239 pounds last year, 19 per cent above the 1935-39 average. Production per capita in '49 was 1 per cent less than in the '35-'39 period.

Of 8 billion pounds of milk received by New York State dairy plants in 1949, 52.2 per cent were used as fluid milk, 31.3 per cent for manufactured products, 14.4 per cent for cream and the balance was shipped out of state for manufacture. Of manufactured products 9.3 per cent went for cheese, 7.5 per cent for butter, 7.2 per cent for ice cream, 4.6 for condensed milk, 2 per cent for dry milk, and .7 per cent for miscellaneous products.

EGGS: U. S. poultrymen own 6 per cent more laying hens than a year ago. While egg supports have been announced through August, there is gossip that they will be discontinued by next January. Purchase of dried eggs for last six months was more than total bought in '49 and no market has been found for any of them. By January 1 it is expected that USDA will own 120 million pounds of unwanted dried eggs which cost taxpayers 125 million dollars.

Brannan Plan boosters, who claim lower prices will step up consumption, had a jolt when retail egg prices 25 per cent below last year failed to increase egg consumption more than 1 per cent.

Turkey prices are expected to slump. Growers should consider finishing and selling part of crop early.

FUNNY FIGURES: Recent United Press story reveals peculiar figuring on the supposed benefits of Brannan Plan. One hundred thousand comic books, designed primarily to "educate" labor union members, took eggs as an example. In figuring the benefits to farmers, so we were told, the highest possible support level was chosen. Some pages later, when the cost was figured, the lowest possible supports were used. Nice figuring if you can do it!

BORROWED PROSPERITY: To a man with the old-fashioned idea that thrift is desirable, much of our present prosperity looks like plain borrowing from the future. The individual who buys on the installment plan cannot use that money again next year. Easy credit provides money now which perhaps should be spent year after next to maintain business. Deficit government financing belongs in the same class. Politicians seem to figure that we can borrow from the future forever, but the man with "old-fashioned" ideas looks for a crack-up some day. While no "bust" is expected in the near future, prudent farmers will get their farms and their finances in shape to withstand eventual lower prices.

ENCROACHING: The idea that government agencies plan to build dams for electric power only where private companies won't, has been exploded. U. S. Interior Department is trying to stop erection of two dams by private capital, one in California and the other in Virginia. Appeal has been made to Federal Power Commission. If the Commission's decision should prevent the erection of these dams by power companies, the decision could have far-reaching effects in furthering government operation not only in power but in many other industries.

TRUE: Some of the troubles facing businessmen were recently expressed in a terse fashion in the following words: "If a company charges too much for its products, it is profiteering; if it charges too little, it is chiseling; if it charges just enough, it belongs to a trust or monopoly, and gets investigated and perhaps prosecuted by the government!"

WHAT TO DO! Sell timber now before building boom slows down. If you have unneeded, used machinery, put it in shape and put it on the market.

If you haven't already started, begin culling laying flocks now.

Good-sized dairy cows are selling for beef for as much or more than dairymen will pay. Selling boarder cows for meat helps increase percentage of milk going into fluid consumption.—H. L. Cosline.

The Song of the Lazy Farmer

MIRANDY'S smug as she can be because she thought she'd punish me by trading jobs so I'd find out what kitchen life is all about. She claims she works from morn 'til night to feed and keep me feeling right, while I am having lots of fun and never get much real work done. Of course, I had to argue back and keep her mind right on that track, by slyly pointing out that wives have got the easiest of lives, 'til she got mad 'nuf to decide that I would have to stay inside and suffer thru her awful chores, while she did my work out-of-doors.

So there she is out in the heat, a-bouncing on the tractor seat, while I enjoy a new-found ease in here where there's a fan-made breeze. No dust is getting in my eyes, what sweat I work up quickly dries, the sun ain't burning me a bit, if standing tires me I can sit; and it sure ain't no strain to break an egg or mix up chocolate cake. But when Mirandy staggers in, I'll give a tired and sheepish grin and tell her that she sure was right, this housework is an awful fright. That way, perhaps, she will make me stay in tomorrow too, by gee.

it pays

Spraying CARROT CROP with Esso Weed Killer 35

to weed the Esso way!

Esso Weed Killer 35 — is proving a great help in vegetable farming in eliminating harmful weeds. It is being used effectively on carrots, celery, parsley, and parsnips; and is being tested on other crops. Proved by tests at several state farm experimental stations, this product has saved time and work in cultivation ... produced large and healthy yields for great profits!

CONSTANT ESSO RESEARCH aids the FARMER

At one of America's largest and most modern petroleum research centers, Esso engineers and technicians are constantly seeking ways to make farming easier, better, more profitable. New products and methods are developed and tested in co-operation with state farm experiment stations to meet farming problems.

ESSO EXTRA MOTOR OIL — for Extra engine protection ... Extra oil economy in your car, truck, or tractor.
ESSOLUBE HD MOTOR OIL — just right for heavy-duty diesel or gasoline tractor and truck engines. Dependable all-weather service for rough going.

ESSO EXTRA GASOLINE — gives tremendous power, long mileage and high anti-knock performance under load!
ESSO TRACTOR FUEL — for "distillate" burning tractors. High power, smooth efficient operation ... low flashpoint for fast starting.

STRAN-STEEL
QUONSETS

4-WAY PROTECTION

- 1 Localize fire—prevent spreading to other buildings
- 2 Will not ignite from flying sparks, falling embers
- 3 N-A-X Steel ribs help reduce danger of collapse
- 4 Help contain fires in single section of building—give time to remove livestock, machinery, crops and other storage

Every year in every section of America, farm fires take a terrible toll in lives and property . . . more than \$100,000,000 worth of equipment, livestock, machinery and crops in storage—plus hundreds of human lives . . . often destroy long years of labor in a few short hours.

Why not plan now to protect your farm property the way so many other farmers are doing—with all-steel, fire-safe Quonsets that assure 4-way *plus* protection . . . that not only resist flames, but once a fire has started, help localize them.

Remember, fire knows no favorites. So, for real peace of mind . . . for the fire protection your farm deserves, ask about Quonsets at your nearest Quonset dealer's—before it's too late!

What Do YOU Think

By JIM HALL

Home-grown Grain

FROM WHAT I see as I roam around this Northeast of ours, we are becoming an important grain-growing area. Production may not be important in total volume as compared to the Midwest cornbelt and Western wheat plains, but it's a mighty important development as far as our dairymen and poultrymen are concerned.

As I see it, several things have contributed to the increased acreage of grains. In the first place, government support of grains has just about forced us to grow our own if we want to show a profit at the end of the year. On top of high supports of our raw materials from the West have come greatly increased costs of transportation due to ever-spiraling wage rates all along the line. Our hens and cows are getting new production records every year, but the market for eggs and milk just isn't high enough to support us and the western grain farmers and the labor costs and profits involved in getting the grain east.

As we predicted several years ago, the emphasis put on grassland farming has also contributed to the increased growth of grain. Many pastures and meadows have been improved so that they need be only half the size they were a few years ago to produce ample top-quality roughage for the same number of cows. The wide-spread acceptance of grass silage has given us more acres for husking corn, and hybrid varieties plus recognition of the value of fertilizer has given us corn yield such as our granddads never dreamed of. It's not unheard of—especially with irrigation—to have one acre produce enough hay, pasture, and silage for a cow.

In Rensselaer County, New York, a few weeks ago I called on four dairymen, and every one of them was producing a large portion of his own grain. The same thing is going on all over the area—even in parts of New England where farmers never felt they had any acreage to spare for grain.

Grows All Feed

More recently I talked to several men in Oswego, Wayne, and Cayuga Counties, in New York, who are all growing some part of their feed grain. The man I found who has made the most of the practice is John Whitmore of Jordan in Cayuga County. Believe it or not, his cost for purchased feed last year was only 7 cents per 100 pounds of milk! John accomplishes

this by going a step farther than most of the fellows in his "home-grown" program. Lots of them are growing their own ear corn, wheat, and oats and mixing it with high protein commercial feed. John does this, too, but he also grows his own soybeans every year and only buys salt to complete his feed ration.

The whole beans, which have about 17% fat, are ground in his own hammermill in a mixture that varies according to what he has on hand, but usually consists of: 15 crates of ear corn, 200 pounds of wheat, 100 pounds of oats and 200 pounds of soybeans. To this he adds 1 pound of salt to each 100 pounds of complete mixture. This feed ration has about 13% protein, and it's all his cows get unless he runs short of home-grown ingredients. When he does have to purchase feed, it's usually early in the fall before his soybeans are ready.

John has been growing soybeans for at least 12 years. He waits until the last week in June to sow them because they thrive in hot weather and because it gives him a better chance to work on weeds. This year he planted 10 acres of soybeans, 16 of wheat, 14 of oats and 26 or 27 of corn for both husking and silage. Last year he had 29 or 30 acres of corn, which filled the needs for his herd and gave him 1,000 bushels to sell. This year he has planted DeKalb 422 for silage and is trying three hybrids for grain—DeKalb 65, Ohio M15 and Funk G10.

High Production

The 157-acre farm and 10 acres they rent is operated by John in partnership with his dad, J. Harry Whitmore. They call their black and white herd "grade," but they've used good sires, and to my eyes they look about as good as many purebred herds I've seen. Their record last year—on almost 100% home-grown grain, timothy-clover hay, and corn silage—shows the quality "grades" they are! They milked an average of 18.4 cows for the year, producing an average of 10,606 pounds of milk and 395 pounds of fat.

Now most of the men growing their own grain—but no soybeans—feel that they can mix their corn, wheat, and oats with anything from 18% to 32% protein commercial feed and maintain the same milk production level in their herd provided they don't try to use more than about half their own grain and half commercially prepared dairy ration. Others, of course, have oil meal

(Continued on Page 41)

John Whitmore of Jordan, Cayuga County, N. Y., was busy cultivating when I stopped by to learn how his herd produces an average of more than 10,000 pounds of milk and 395 pounds of fat on home grown feed. Last year his cost for purchased feed was only 7c per hundred of milk. The heifers in background endorse his home mixed feed.

Learning Our 1950 Apple Scab Lessons

By E. Stuart Hubbard

President, New York State Horticultural Society

HERE in the Hudson Valley, apple growers are really learning the idiosyncrasies of apple scab. We thought that we experienced all that scab could do two years ago. We are learning some new tricks that it can play on the supposedly professional grower.

Some facts have been emphatically demonstrated this season:

➔ That some varieties are almost immune to apple scab, while others can be expected to have the fruit ruined and the foliage disfigured by its spots. This was strikingly apparent in a city yard. A double tree had been grafted half to McIntosh, half to Baldwin. The McIntosh leaves were unsightly with brown scab spots, while the Baldwin part was as handsome a shade tree as one could want. An adjoining Greening tree was a mass of dead leaves and twigs from fire blight in the blossom clusters. The McIntosh and Baldwin were blight free. Any one wishing to enjoy the beauty of bloom and form and the shade of an apple tree in their grounds can have them with little or no spraying by choosing disease-resisting varieties. With the use of a hormone spray after bloom, all the fruits can be made to shed, thus avoiding the nuisance of dropping insect injured apples that can be expected from most ornamental apple trees.

➔ The advantage of hill locations, where fog and mist clear quickly and the first breezes and rising sun dry the leaves and fruit, has made it possible to keep McIntosh trees practically free from scab while orchards, within an eighth of a mile but in damp, shaded hollows, have had their fruit ruined by scab even though they have received the same spray schedules as the hill orchards. Here, again, the location is important for ornamental apple trees as well as commercial orchards.

➔ The need for frequent applications of protective sprays as well as good adhesive quality in the material is shown in a year when nearly every day has brought a scab infection period. It has been necessary to cover each leaf as it unfolds or to kill every entering spore within two days of the start of the rain to prevent infection.

➔ The idea of burning out scab spots that appear in the leaves sounds good. In normal seasons it seems possible to insure against secondary scab infection by killing the leaf tissue under a scab spot with lime sulfur or mercury. We are finding that while we may destroy all but the margin of the scab spot and can normally paralyze its ability to reproduce,

it is necessary in a wet, humid season like this to use caustic sprays repeatedly or to keep the fruit constantly covered with a protective coating. For life remains in the margin of the scab spot ready to respond to the stimuli of lush leaf tissue and moist leaf surface.

➔ The washing effect of copious rains has been shown by the disappearance of spray and dust from the upper foliage and fruit, making necessary more frequent applications than called for in normal spray schedules.

A better understanding of these factors throws light on conditions under which we grew and bought apples forty to fifty years ago. Few growers then used any sprays. Most years, scab was not a factor except in very moist hollows. Varieties like Newtown and Fall Pippin, Snow or Maiden Blush were more prone to scab than Baldwin and Greening, Spy and the Russets. But even the more susceptible varieties were practically free from scab in the best located orchards. There were occasional years, however, when all varieties, even in usually favorable locations, were seriously marked with scab. Wet periods in August and September brought on serious pin point infections on fruits free from early scab scars.

With the coming of varieties like McIntosh, Cortland, and Delicious, and with the concentration of heavy plantings, the problem of scab control has been made much more difficult.

— A. A. —

FROM THE Editor's Mailbag Poor Buying

I HAVE just finished reading "Millions for Frills, Pennies for Milk" in your June 3 issue. I agree that milk isn't advertised enough. I don't believe there would be a large surplus if the welfare families were made to use wholesome food. Did you ever watch a welfare mother buy her weekly groceries with your money and mine? I have. She buys oleo instead of butter, potato chips and sticks instead of a sack of potatoes, a can or two of condensed milk for the baby, and the other children drink pop.

You seldom catch a relief client eating the kind of fruit which is in season. Would she buy a sack of flour and bake? Not on your life! Baked goods from the store are much better! Unless we put a stop to their spending cold cash, there always will be a surplus of farmers' products. They used to be given grocery orders and I can't see why it wasn't continued.—Mrs. Howard Irish, East Concord, N. Y.

Man's Greatest Heritage

I WAS very much interested in the "What Do You Think?" discussion of various ways used in plowing and fitting soil. I believe that all soils should be plowed deep enough to turn up a little subsoil so as to get the organic matter in the top soil down deeper. It is not possible to build top soils up, but it is possible to build the top soil down if a little of the subsoil is turned up to let the top soil go a little deeper.

After plowing in the above manner I like to harrow with the disk both ways and then follow with the spring tooth harrow and cultipacker. A piece of land well plowed is half harrowed and a piece well harrowed is half cultivated.—C. G. Stockwell, Roxbury, Conn.

**FORD INTRODUCES
DARING NEW TRACTOR
ADVANCEMENT**

**ONLY
FORD
TRACTOR
HAS THE**

**PROOF-
METER**

FOR THE FIRST TIME—

PROOF of Engine Performance
Peak pulling performance and fuel economy on most types of field work are reached at engine speeds of around 1750 r.p.m. Proof-Meter lets you know you're at this speed.

PROOF of Right Tractor Speed
In such operations as mowing, raking, spraying, planting, etc., it is important to hit and hold the right tractor speed. With the Proof-Meter, you can know—not guess.

PROOF of Correct P.T.O. Speed
The Proof-Meter tells you at a glance when corn pickers, corn snappers, mowers and other P.T.O.-operated machines are running at the right speed for best work.

PROOF of Proper Belt Pulley Speed
Belt-driven machines work best when operated at the belt pulley speeds specified. With the Proof-Meter, you can operate at this correct speed. No separate counter needed.

ACTUAL PROOF OF TRACTOR PERFORMANCE RIGHT BEFORE YOUR EYES

No other tractor manufacturer has ever given you anything like this Ford Tractor Proof-Meter. None has ever dared to make it so easy for you to check tractor performance, before and after you buy.

The Proof-Meter tells you the things you need to know in order to operate your tractor most efficiently and economically—to keep it always in the pink of condition—to get the best results on any job! Nothing like it ever before on any tractor!

The Proof-Meter will help you get best performance out of plows, harrows and other implements. It will help you operate P.T.O. and belt-driven machines at their most efficient speeds. It gives you a chance to keep records, to reduce operating costs and increase your farm profits. It will pay you to make a date for a PROOF demonstration right away.

DEARBORN MOTORS CORPORATION • Detroit 3, Michigan
IF YOU HAVEN'T DRIVEN A FORD TRACTOR LATELY YOU'VE A SURPRISE COMING!

Since the announcement of the present Model 8N Ford Tractor, Ford engineers have now added a total of 36 substantial improvements, plus many minor refinements. There's the new Proof-Meter—12% more drawbar horsepower and pounds pull—20% greater belt horsepower—many other new features. Why not get behind the wheel of a new Ford Tractor—soon? A real surprise is waiting for you.

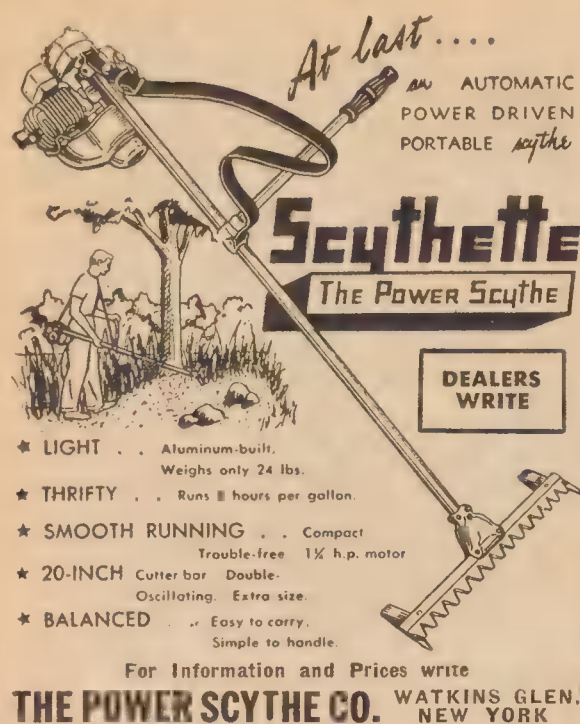

PROOF of Hours Worked
No more guesswork as to when to lubricate, service or adjust vital parts. Proof-Meter indicates hours worked. Now you can know the Ford Tractor "works more hours—saves more hours."

Maintaining Ladino Stands

By George Serviss

LADINO clover is a very valuable legume, in my opinion the most valuable legume for pasture purposes in the Northeast. However, it is not a perfect plant. In other words, it will not live forever and stay productive under any system of management or lack of management or without any lime or fertilizer program.

Ladino clover is a true perennial, but most stands that have been established for any period of years contain a high proportion of plants due to natural re-seeding by the original plants. It is im-

portant, therefore, during the first year or two that the stand is down, to so manage the stand as to permit considerable seed development. It takes about eight weeks for ripe seed to develop following the removal of growth by mowing or grazing. This is best done the first harvest year in the life of the stand, which is the year after seeding. It should be done at a time of the year when the accompanying grass is not growing vigorously. This is usually a time of the year when it is inconvenient to keep the stock off for that length of time, but the ladino will

benefit by it.

A must in management is early removal of the spring flush. This reduces the competition of the grass and permits the ladino to spread out and thicken up.

Closeness and frequency of grazing have also been shown experimentally to influence vigor and winter killing. No definite recommendation can as yet be made, but keeping it grazed into the ground for long periods definitely weakens it. It seems desirable at present to let it go into the winter with three to four inches of growth. Much more growth than this seems undesirable, not because it weakens the plants but because it appears to make conditions favorable to the development of certain diseases. No practical control measures are known for these diseases but there is hope of resistant strains in the future.

Adequate fertilization is also extremely important. While ladino is more tolerant of moderate soil acidity than alfalfa, it is still desirable to keep the pH of the soil around six. Phosphoric acid and potash are the two plant foods that have the greatest influence on its persistence. Potash fertilization is more often neglected than the use of phosphoric acid, yet on many soils it is now more often limiting. Fertilizers such as 0-20-20 and 0-19-19 + borax should be used annually for top dressing except in years when superphosphated manure is applied as long as the ladino makes up a substantial part of the herbage. Nitrogen, even nitrogen in manure, should be used sparingly on ladino unless perhaps when it is liberally balanced with potash. Once the accompanying grasses get the upper hand the reverse is true; then the fertilizer program should be high in nitrogen and liberal application of manure or 10-10-10 would be in order.

— A. A. —

BORAX TOPDRESSINGS FOR LEGUMES

Topdressing legumes with boron after harvest may prove profitable especially in seed production, writes J. B. R. Dickey, Pennsylvania Extension Agronomist. According to Dickey, "Soils in the southern half of the state and limestone soils generally are most likely to respond to boron treatment. Marked benefits in yield and longevity of alfalfa stands have been reported in some experimental applications of about 25 lbs. of borax per acre, especially on heavily limed soils and in dry seasons. Borax (or 400 lbs. of borated 0-19-19) can be broadcast after harvesting the first crop. Applications should be made only when the leaves are dry to avoid burning, and early to permit rainfall to wash the nutrients into the soil."

— A. A. —

WHAT DO YOU THINK ?

(Continued from Page 6)

and other ingredients added to the home-grown products to end up with a mixture that's practically the same as commercial feed. Hundreds are adding molasses or grain to grass silage as it is put up and they find that this, too, enables them to cut down on the amount of supplemental feed they have to buy.

It just seems to me that John Whitmore has worked out something that could be copied by many others. What do you think? I'd like to hear from anyone who is growing or has grown at least part of his own grain for either cattle or poultry. Let me know what results you've had and I'll pass the information along to your neighbors throughout the Northeast.

— A. A. —

Rotenone is one of the best ingredients of a garden dust. It kills both chewing and sucking insects but is not poisonous to humans.

"They're getting telephones on Mill Road"

In every community, in every rural area served by the Bell System, more telephones are going in.

Thousands of farm families have telephones for the first time; thousands more are getting them. We've added nearly a million and a half since 1945; right now we're putting in 1000 every working day.

We're making steady progress, too, in improving service. Lift-the-receiver type telephones are being installed fast. The number of parties on party lines is being reduced and divided ringing is cutting down the number of rings each customer hears.

BELL
TELEPHONE
SYSTEM

The number of rural telephones has doubled in the United States in the last ten years. And we're keeping hard at it — our aim is still more and still better telephone service for the rural family.

The Styleline De Luxe 2-Door Sedan

For exclusive big-car features, choose the leading low-cost car!

That's right . . . Chevrolet is the low-priced car with exclusive big-car features. Just check them over and you'll agree that Chevrolet gives more for the money, in every way!

It drives like a big car! So easy to handle, on rough roads as well as highways. Absorbs the shocks—smoothly. Hugs the road—surely. Has the *feel* of a big car. What's more, it will "stand up and take it" under all conditions!

It rides like a big car! You get big-car comfort . . . with "five-foot seats" that accommodate three big people. And

plenty of leg room. As to the "ride," itself—only *riding* in the new Chevrolet can give you the answer. It's luxury!

It's the most economical! You get genuine economy with Chevrolet . . . with many extra values built in. A powerful Valve-in-Head engine that is famous for its economy . . . and even more famous for its low maintenance costs!

Yes, the car to choose in '50 is Chevrolet. It offers the big-car features you want . . . yet Chevrolet is the lowest-priced line in its field. See it at your Chevrolet dealer's today!

CHEVROLET MOTOR DIVISION, General Motors Corporation
DETROIT 2, MICHIGAN

FOR ROOMINESS—choose Chevrolet! You're free to relax and enjoy the uncrowded luxury of these spacious "five-foot seats" when you ride in your new Chevrolet. And you'll appreciate Chevrolet's roomy trunk to take care of your bundles on vacations or shopping trips. At the twist of a key, the trunk pops open.

FOR POWER—choose Chevrolet! You have your choice of the new 105-h.p. Valve-in-Head engine with Powerglide automatic transmission,* or the standard Valve-in-Head engine with Synchro-Mesh transmission.

*Combination of Powerglide transmission and 105-h.p. engine optional in De Luxe models at extra cost.

FOR STYLE—choose Chevrolet! You'll get a thrill every time you see the sleek good looks of your Chevrolet for '50. And it's a thrill you'll enjoy for years . . . Chevrolet has the kind of styling that lasts. Fourteen smart Styleline and Fleetline models—in a wide variety of color combinations—for your selection.

FOR SAFETY—choose Chevrolet! The wide curved windshield and generous window area provide vision that's tops for safety. And Center-Point steering with Unitized Knee-Action, airplane-type shock absorbers and wider tread tires assure you a smoother, road-hugging ride.

FOR PRICE—choose Chevrolet! Examine the big-car features of the new Chevrolet. Then examine Chevrolet prices . . . and discover that Chevrolet is the lowest-priced line of all! Another reason why Chevrolet is America's No. 1 favorite year after year . . . why you'll be better off when you choose Chevrolet.

Growing wheat?

Increase your yield and lower your costs with

Blenn!

This year especially, the bigger the yield you get from every acre at low cost, the more money you'll make from your wheat crop.

Just as a combine is designed to save labor and money at harvest time, BLENN is designed to help produce bigger wheat crops at lower cost. So this year especially, you should use BLENN—Swift's specialized crop maker—along with good seed.

Here's the reason: BLENN is especially made to supplement the plant food nutrients in your particular soil. Together, your soil's natural nutrients plus BLENN supply all of the many plant food elements your wheat crop needs for finest growth and biggest high-quality yields at lowest cost.

Using BLENN pays off!

BLENN is a low-cost investment that pays big dividends in far higher yields from every acre you plant. BLENN more than pays for itself—it brings in extra cash besides.

BLENN is 4 ways more uniform

BLENN grows more bushels per acre because it is a *specialized* plant food that is so uniformly blended that every plant gets a perfectly balanced ration of needed growth-making elements. Swift's *exclusive* manufacturing process makes BLENN more uniform in four important ways: (1) uniform blending, mixing, curing; (2) uniform freedom from caking, lumping, bridging; (3) uniform distribution through your machines; (4) uniform feeding of your crop.

BLENN feeds your crop from the very beginning right through to harvest. It produces a uniform wheat crop with long heads, well filled with high-grading grain.

This year, increase your yield per acre at low cost with BLENN. See your Authorized Swift Agent today and order this crop-boosting, income-boosting plant food early.

Where Do Potato Growers Go From Here?

(Continued from Page 1)

consumer advertising, stressing healthfulness and vitamin content, and by generally better merchandising methods which will require cooperative effort."

—Fred Hollenbeck, Tully, N. Y.

Voluntary Compliance

"Marketing agreements and orders could serve a useful purpose providing (1) they were set up to meet the marketing conditions peculiar to New York State, and (2) if over 80 per cent of the growers were willing to cooperate voluntarily.

"I do not favor price supports. Possibly, below-cost support prices would be beneficial to the general public.

"Acreage or marketing controls are necessary and advisable only to accompany high support prices.

"For the efficient producer who is located on good potato soil and who markets efficiently and honestly, potatoes should continue to be one of the higher paying enterprises in New York State agriculture." —Stuart A. Child, Malone, N. Y.

Favors Acreage Quotas

"If all controls and supports were removed from agriculture, I can foresee a period of extremely low prices and low agricultural income, followed shortly by low national income, inability to raise by taxation enough to service the national debt and serious national consequences.

"If I were a national legislator I believe I would favor an acreage quota law in the case of potatoes, possibly without price supports, but giving any and all marketing areas the privilege of voting for marketing agreements and orders.

"When there is overproduction, it seems to me like a sensible thing to allow farmers to withhold enough of the lower grades to bring supply into relation with demand, and to enforce this action upon all producers and handlers in the area, wherever such enforcement seems practical or possible.

"Either with or without potato programs or price supports, good potato growers located fairly close to markets should find the long range outlook fairly satisfactory, but if all controls are off, strong financial reserves probably would be needed to withstand several lean years." —Nat Talmage, Riverhead, L. I.

Price Support Means Regimentation

"I believe that potato marketing agreements and orders have a great deal of merit in those areas where they can be successfully administered, such as Maine, California, Idaho, Red River Valley and similar areas. I question if marketing agreements can be successfully administered in such areas as New Jersey, Long Island and upstate New York where the bulk of the potato crops is moved out by truck. This makes policing practically impossible. My reasons for feeling that marketing agreements offer a great deal in areas where they can be administered are two-fold:

"First, we are not giving the consumer as good quality potatoes as we should in view of normally having surpluses. The Marketing Agreement Program is designed to give the consumer the better portion of the crop.

"Second, the Marketing Agreement Program is a self-help program whereby the industry helps itself to reduce surplus supplies.

"With reference to price support, I do not favor continued price support after this season. This represents a change in position in that up until six months ago I favored price support. My changed thinking is because I have come to the conclusion that no indi-

vidual or group of individuals is capable of satisfactorily administering a price support program designed to cover the potato industry of the entire United States. I also believe that no group of individuals, including the United States Government, is big enough to defy the laws of economics. I believe that price support, in the long pull, will result in complete regimentation of growers and will place a premium on inefficiency.

"The third question that has been raised is, 'What is the long distance outlook for the good potato grower?' Recognizing that I may be prejudiced in my opinion, I would say that the good potato grower who is located in an efficient area of production has a favorable outlook, providing we do not have price support. If we do have price support, I believe that the good grower and the efficient areas of production will be sacrificed for the benefit of the inefficient grower and the inefficient areas of production.

"This is a brief statement of my personal opinion and should be accepted as such." —H. E. Bryant, General Manager, Maine Potato Growers, Inc.

Enforcement Difficult

"A potato marketing order and agreement properly administered and enforced could be a real help to the potato industry. However, at present we are unable to enforce the grade branding laws we now have, so how could we control anything more complicated? In areas where the shipments are made in large lots it is possible to enforce an order, but we sell so much retail that there would have to be too many exceptions to make it worth anything.

"As for potato price supports, I am strongly opposed to them along with acreage controls which price supports necessitate. They all lead us away from the American Way.

"I think the grower who is efficient and conscientious in growing a crop that his market wants has a pretty good future. Of course there will be bad years, but there always will be a market for good potatoes." —George Humphreys, New Hartford, N. Y.

Paid Incentive Opposed

"I do not favor price supports, or production incentives, or inducements on any perishable or inedible commodity.

"If we are going to have to live with potato price supports, the 60% level looks fair based on a quality and bushel basis. Marketing agreements and orders would have to be used in areas remote from big consuming centers, and where they could be economically administered.

"Good potatoes selected for a specific use and consistently graded for such use will always be in demand. With incomes at high levels, modern transportation, and a year round variety of fresh vegetables, it is going to be a stiff battle to maintain per capita consumption of potatoes where it is today."

—James T. Colby, Litchfield, N. H.

No Handouts Wanted

"The potato grade regulations and other marketing agreements should be adhered to in order that the buying public may know where the potatoes come from and what grade and quality they are getting. If and when these standards of grade and quality are complied with, and so marked by grade and state so that the buyers know what to expect, then there should be no need for a price support. The rule of supply and demand will be governed by the survival of the fittest, as is supposed to be the American way of life, with individual freedom and equal rights for all.

(Continued on page 13)

Pertinent Paragraphs from Dairy Scientists

DURING the week of June 19 the American Dairy Science Association met at Cornell. From the many talks given, here are a few high spots of particular interest to dairymen.

BETTER SELLING: G. M. Trout of Michigan State College, president of the Association, told listeners that "the country roll and butter crock days in selling dairy products have gone with the cracker barrel. Now emphasis must be put on merchandising as well as on quality and sanitation."

PERSISTENCE: M. H. Alexander of the University of Illinois, presented evidence to show that persistent lactation, the ability of dairy cows to produce during successive months a high percentage of the amount of milk produced during previous months, is a factor which is inherited.

Mr. Alexander also said that Ayrshires, Holsteins, and Jerseys have a shorter gestation period than the generally accepted 281-day average, and that the length of pregnancy in Brown-Swiss and Guernseys is somewhat longer. Also, the offspring of different sires show differences, and the logical conclusion is that the length of the gestation period can be inherited.

FERTILITY: R. S. Dunbar of Cornell reported that fertility in dairy cattle is not inherited, and suggested that the emphasis in selecting breeding stock be placed on other important traits.

CUDS FOR CALVES: H. R. Conrad, J. W. Hibes, and T. S. Sutton of Ohio State University, gave the results of tests showing that inoculating calves with cud material from older cattle provides calves with feed-digesting bacteria. In this case, inoculation consists of putting some cud material in the calf's mouth. Calves so inoculated digest about 5% more cellulose and 4% more of the dry matter in a whole-milk-alfalfa hay ration than uninoculated calves digested.

CAROTENE: J. W. Crowley of the University of Wisconsin said that experiments there demonstrated that carotene (which protects calves from a deficiency of Vitamin A) is absorbed better in oils from corn, soybeans and butter than when given in mineral oils.

MILKING TIME: K. E. Harshbarger of the University of Illinois reported that the rate of removal of milk from a cow's udder is greater in high-producing cows than in low-producing ones. Therefore, it does not take twice as long to milk a cow that gives 60 pounds as it does to milk one that gives 30 pounds.

3X MILKING: J. G. Cash of the University of Illinois told of an experiment in which half of a cow's udder was milked twice a day and the other half three times a day. The half that was

milked three times a day produced 32% more milk than the one milked twice, and as the lactation period progresses the difference becomes greater.

CHEESE: The U. S. Bureau of Dairying Scientists gave evidence indicating that milk from cows treated with penicillin and streptomycin may not make good cheese.

FRUIT FLAVORS: C. C. Flora, L. L. Davis, and C. W. Holdaway of Virginia Agricultural Experiment Station, told the audience that essences made by distilling the volatile flavors from the fruits, when added to fruit used in ice cream, gave a better flavor than ice cream with fruit alone. The improvement was greatest when added to canned fruits, as the flavor of frozen strawberries and peaches alone was reasonably good.

ROUGHAGE: G. W. Werner of Wisconsin reported that the quality of hay and silage in that State has suffered as a result of emphasis on labor-saving and easy harvesting. However, improvement of new machinery is gradually overcoming this difficulty.

EARLY MATURING: F. A. Buschner of the University of Connecticut reported that cows that reach their third calving date before the average of the herd are the more efficient producers, if the effect of abortion is excluded.

LIGHT: W. J. Sweetman of the Alaska Experiment Station reported that supplying artificial light to lengthen the Alaskan day from 8 to 14 hours increased the conception rate of cows from 49 to 54 per cent.

COMFORT: I. D. Porterfield of West Virginia University stated that cows yield more milk when kept in large "comfort" stalls than when kept in smaller tie-chain stalls. The same amount of bedding was required for each stall, but cows in the "comfort" stall rested approximately 2 hours a day more than those kept in tie-chain stalls.

JOHN CASTROGINI— Star Farmer of America

(Continued from Page 3)

bond. There are certain personal stipulations attached to the agreement, but we need not mention them here. John's father is in poor health. The farm is valued at \$10,000. John's other assets—livestock, farm machinery and equipment—are worth \$17,000.

At high school Jim was an exceptional "ag" student and valedictorian of his class in 1946. He taught the "ag" classes at Montrose High as my substitute several times. He has held various important offices and is well known in the community. He is vice-president of the local Young Cooperators organization, a member of the National Executive Committee of Young Cooperators, secretary of the Dairymen's League local, and he has held offices in the FFA local and state organizations.

During his school years and since graduation he has been given advice and encouragement by Mr. George Derr, vocational agricultural supervisor of Susquehanna County; Mr. Derr recognized John's qualities from the start and was always eager to help him become a better farmer. When John was selected as a star farmer this year, Mr. Derr felt repaid for all his effort.

John is young and ambitious. He ought to go places in this land of ours. Don't be surprised if you come across his name again.

"Now do you believe my automobile will do a hundred miles per hour?"

New single-service towel... KOWTOWL HELPS CONTROL MASTITIS

SPEEDS UP
milking routine

LOWERS
bacteria count

Makes proper sanitation
EASIER

Use **KOWTOWLS**
once—then
throw away!

"On our herd of Pure-Bred Guernseys, of about 180 head, we have been using the Nibroc Kow-

towls for preparing the udder and teats for milking. We expect to continue to use the Nibroc Kowtowl here at Begeacres Farm at Ithaca, N. Y. We are well satisfied and feel that this is a great improvement in our health control program and in the long run more economical than less modern methods."—Gordon C. Begent, BEGEACRES FARM.

This new single-service paper towel is a real aid in controlling Mastitis. When you use Kowtowls to prepare cows for milking, there is no chance of spreading contamination from one cow to another through the towel because you use Kowtowls once—then throw them away. Kowtowls are heartily recommended by Veterinarians and Milk Inspectors all over the country.

Kowtowls make your job easier, too!

No more washing and boiling cloths or rags. Instead, reach for a fresh, soft Kowtowl. Although Kowtowls are disposable, paper towels, they are not flimsy. Even when wet they never crumble or fall apart. Economical, too. Disinfection solution stays warmer longer and Kowtowls cost as little as \$1.70 per cow for a whole year's supply. Remember—use **ONE** Kowtowl to clean and massage each cow. That's all you need.

Long Island Granges to Conduct Tour

THE MEMBERS of Suffolk-Nassau Granges will conduct a tour of Eastern Long Island for upstate members on August 11, 12, 13 and 14th, under the leadership of the State Deputy and the Juvenile Deputy, Mr. and Mrs. Albert Halsey of Southampton.

They aim to show what little Long Island has in the way of beauty, agriculture and friendliness. The tour has been so arranged that visitors will arrive at the Long Island Technical and Agricultural Institute, Farmingdale, on Friday evening, and on Saturday morning Long Island members will join in the tour of the school, Grumman's (Aeroplane) Plant, Levittown, then come east to Long Island Duck Packing Plant at Eastport, then proceed to Hither Plains Park at Montauk Point for a picnic supper.

Members from upstate will stay with Long Island members on Saturday night. Sunday morning is to be taken up with a tour of agricultural and beauty spots on both the north and south sides of the Island, with an outdoor church service on the lawn of the oldest house of Southold Town, and dinner at Sound Avenue Grange Hall.

Those not in a hurry to get home can stay at the State School at Farmingdale on Sunday night for further touring on Monday.

Anyone who would like to join with their Brothers and Sisters are most welcome. Write for particulars to either Albert Halsey, Southampton, or Mrs. Leander B. Glover, Sr., Cutchogue, L.I.

— A.A. —

"HAYFIELDS" FIELD DAY JULY 19TH

"Hayfields," the Monroe County, New York, farm of T. E. Milliman, will be the scene of a field day, Wednesday, July 19. From 10 a.m. until dusk, visitors will have an opportunity to witness the operation of a power silo unloader which removes silage from the bottom of Mr. Milliman's new Harvestore. He finished filling the new type, glass-lined structure with grass silage last month and says the structure is so air tight that there will be no top spoilage to throw out when he is ready to refill with corn silage this fall.

Also ready for inspection at Hayfields will be a seeding of Atlanta alfalfa, a herd of cross-bred dairy cattle, and a new pasture seeded this spring to the specifications of a dozen expert agronomists and animal nutritionists. Signs will point the way to the farm from Churchville, Scottsville, and Caledonia.

— A.A. —

TABER TO HELP GOSS

Paul Taber who has been director of Farm Organization Relations with the G.L.F., Ithaca, New York, has been granted a one-year leave-of-absence by that organization. Beginning June 1 he is now acting as assistant to National Grange Master Albert Goss. Mr. Taber is very well known in Ithaca and, in fact, throughout the Northeast. He has been active in Grange and other farm organization work for many years.

ONE YEAR DAIRY COURSE AT CORNELL

The New York State College of Agriculture at Cornell University will again give a one-year dairy course beginning the third week in September. Applicants must be high school graduates and have the usual entrance credits required by the University. Applications should be made at once and requests for further information can be made to Professor Lee Harden, Roberts Hall, Ithaca, N. Y.

The courses included in the curricu-

New York State's Governor Thomas E. Dewey receiving the Dairyland Festival, "Key to Health" from Queen Wanda Matuscak at the sixth annual Dairyland Festival held at Watertown, New York, recently.

lum are definitely of college grade. They are designed to help those who already know some of the "how" of the dairy industry to learn also some of the "why." One who completes the program with a superior record and who so desires, may transfer to the regular degree course and receive credit for all the courses he has passed in the one-year curriculum.

— A.A. —

NEW YORK STATE FAIR NEWS

Wendell Field has been named superintendent of the Boys and Girls Department at the New York State Fair, dates of which are September 2 to 9. Assisting him will be Martha Leighton and David Fales of the State 4-H Club Office; James Hatch of the State Education Department; Robert Ogle in charge of poultry; Arthur Pratt, crops; Harold Willman, livestock and dairy; Fred Winch, agricultural engineering, and John Lennox, special 4-H demonstrations.

More than \$15,000 in premiums are being offered in the Boys and Girls Department.

— A.A. —

On August 14 and 15 the New York State Horticultural Society will hold a summer meeting and tour in Ulster County.

Henry Sherwood of Pine Plains, New York, Master of the New York State Grange, has been appointed chairman of the executive committee of the 1950 Christian Rural Overseas Program. Known popularly as C.R.O.P., this organization has designated September 10 as C.R.O.P. Sunday and that day workers will start on a farm-to-farm census to obtain farm commodities to send for overseas relief.

KEEP YOUR SUBSCRIPTION TO AMERICAN AGRICULTURIST RENEWED

Save August 3rd

The Empire State Potato Growers' Field Day will be held this year at the Maurice Phelps Farm, Chaffee, Erie County, N. Y. The date is Thursday, August 3. Highways leading to the farm will be well posted. The farm is about 1/4 mile north of Chaffee on Route 16.

Plan to attend and make it an all-day affair. Get there early so you will not miss any of the machinery demonstrations.

WHERE DO POTATO GROWERS GO FROM HERE?

(Continued from Page 10)

"The potato industry in the USA is a large one. It supplies one of America's greater food commodities. The New Jersey growers realize that in order for the potato to hold its high position as a food commodity, we must produce the best and grade it well. The potato grower does not want or expect any government handout. Acreage control and high price supports should be a thing of the past.

"We grow from 85 to 150 acres of potatoes a year, and if the potato grower is given a good growing season, he will produce potatoes that you will enjoy eating and be glad to pay a fair price for."—Harold L. Collins, Moorestown, N. J.

Grading Creates Demand

"If the smaller growers feel that, as a long-range program, they prefer local and state supervision to Federal control, all of us should face our individual responsibility for correct grading and packaging under adequate state enforcement.

"This would enable a grower to sell whatever quality and type of pack he could best put onto the market, and assure the consumer of obtaining whatever quality she could afford to buy.

"In line with present tendency of other foodstuffs, New Hampshire passed a branding law, requiring statement of grade, weight and packer's name, on every closed container of potatoes. Vermont has not passed such a law, but we have found that the packing of quality potatoes in branded bags creates a local demand at profitable prices. On the other hand, low income groups cannot afford to buy this way, and will consume many of our culls if they can buy them in burlap at the farm at discounted prices." — Mrs. Gertrude F. Peaslee, Guildhall, Vt.

Better Marketing

"Farmers have made great advances in production of potatoes but their methods of marketing them are very inefficient. I believe a potato marketing agreement could be of distinct advantage for the reason that it would be a step in better marketing.

"For the economy of the nation at large, it is imperative that the income of agriculture be kept at a level, comparative with the rest of the nation's business. This cannot be done with low supports of farm products.

"It is necessary to have acreage controls if we have supports, either high or low. Potato growers must recognize the necessity of getting the supply of potatoes in line with the demand before we can expect any real stability in the potato industry.

"Some farmers believe that if they should vote for a marketing agreement, they would then have to accept price support. This is not the case. We could have marketing agreements, and only those who wished could comply with acreage allotments and have price supports." — Maurice Mallory, Susquehanna, Pa.

THE CLOSER YOU GET TO DIGGING TIME
...The More Help You Get From DITHANE

Late blight is most costly when the crop's full-grown. Then it can steal a whole season's work. But DITHANE protects your crop—from start to finish—and pays off in bonus bushels.

A powerful preventive fungicide, DITHANE sprays and dusts can also stop blight—even after it's developed. It's this two-way protection that makes a DITHANE program especially valuable from now until harvest time.

DITHANE controls many diseases of many crops. It is also a safe fungicide for foliage, blossoms and fruit of tomatoes, cantaloupes, cucumbers and other copper sensitive crops. The result: crops sprayed or dusted with DITHANE consistently outyield crops treated with other fungicides.

See your dealer for dependable DITHANE dusts and sprays.

DITHANE is a trade-mark, Reg. U. S. Pat. Off. and in principal foreign countries.

DR. SALSBUURY'S
Cloro-Caps

Easy To Use
Individual Treatment

Don't let worms lower your poultry profits. It's hard to tell, by appearance, when birds need worming. So, do as thousands do, worm with Cloro-Caps during the summer months. The first wormer that gets tapeworms. Test-proved. Used on thousands of birds. Buy at hatchery, drug or feed store. Dr. Salsbury's Laboratories, Charles City, Iowa.

Questions Poultrymen Ask About Culling Hens

By L. E. Weaver

Is every non-laying hen a cull? Should all such hens be thrown out of the flock?

No. Occasionally a hen will be temporarily out of production, but will show signs that she may soon be back on the job. Such hens, if left in the flock in early summer with egg prices starting upward, may become good income aiders. Hens that were recently broody are often in this class; also those recently recovered from Newcastle disease, or some that were slowed down by mites or other neglect in management. However, at least nine times out of ten, a hen that has quit laying is a "cull" and should be culled out.

Should all hens that are in "laying condition" be left in the flock?

No. Some hens are slow by nature and seldom lay more than barely enough eggs to pay their way. By this time of the year they have slowed down to where they are money-losers, but they are still plugging away with an egg or two a week. They are soft and loose in the abdomen like any other hen "in laying condition," but you can spot them by the yellow color that they still carry on their legs because they have never layed enough to use it up. Another giveaway is lack of weight for her size and lack of fullness in the abdomen, indicating that the hen is a light eater. Heavy layers are heavy eaters.

If you are handling every hen in a thorough job of culling, you are bound to find a few that are practically ready to quit, but are still good for an egg or two. They still will be "in laying condition" but will not have full abdomens. Better take them out!

Then there is the very fat, heavy hen that has a full abdomen and moist loose vent which indicate laying condition, but the abdomen is full of hard, lumpy fat and you know that her feed is mostly making fat and not eggs. Here again the tell-tale yellow legs say "take her out!"

If you are only going to cull once, what is the best time?

In the first place, that would be poor poultry flock management. From now until late fall you ought to cull at least once each month. But if you don't mind feeding a lot of hens while they molt, lose weight, grow a new coat of feathers, and regain their weight at your expense (and you then have to sell them in the fall for less than they would bring now), you probably should wait and do that one grand culling job just before you bring in your new pullets.

Is there any easy way for a man without any help to cull his flock?

It's according to what you call "easy." One of the first lessons a poultry-keeper should learn is to use a catching hook. He should start using it soon after he puts his pullets in the house and use it often enough so that the birds pay little attention to it. Then culling becomes a year-round, weekly or even daily part of the poultry chores. That is a one-man job and is the best way to cull. You get them before they have eaten a lot of feed and before they have lost much weight. They are easier to sell, because they are in better condition and they bring more money.

When I had my own flock of Leghorns, they were on roosts two feet off the floor. It was easy to go in with a flashlight and crate after dark, spotlight a few heads at a time, and pick

off the hens with dull or dry or wilted combs and put them in the crate. Next morning I finished the job. Many of the hens I had been wrong about, and I released them, but I got most of the obvious culls. However, I suggested this plan to a poultry woman recently, and she said she had tried it but that it didn't work. Her hens wouldn't sit still. Maybe they have to be roosting so close together, as mine were, that they can't move away.

How much help is needed for a culling job where every hen is handled?

At least three. One man to do the examining and make the decisions; one to hand the birds to him, and a third man to put the birds in their respective crates if they are to be moved to other quarters. If not, the hens-to-be-kept are dropped on the floor, and the culler can put the culls in crates while the third man helps get the birds to the culler. That is the usual indoor procedure. One end of a strip of welded wire fabric 4 feet wide and stiff enough that it won't sag is tacked to the wall near one end of the room. The hens are rounded up behind this temporary partition, and the other end is then fastened to the opposite or adjacent wall with the "catcher" in the pen with the hens. After they quiet down, he either uses a hook or he picks them up by hand and hands them over the wire to the man outside, and he to the culler. Both the man inside and the one outside must watch the corners to see that the hens don't pile up and smother the ones at the bottom.

A better setup where it can be used is to do the culling outside. The hens are penned as described above, then driven through an exit door in succeeding drives into a catching crate (or several crates set end to end). Here one man can take the hens from the catching crate and give them to the culler, and the third man puts them in regular poultry crates.

QUALITY EGGS

WE'RE ALL bothered, and justifiably so, about high feed prices. Being bothered and doing something about it, however, are two different things. Most everybody realizes that last year's huge grain supplies would have lowered feed prices at least into line with egg prices, if it weren't for government purchases, holding, and foreign shipments. But we can't do much about that, except holler.

But here's something we might think about and work on. Now be sure to follow me and "stop me when I'm wrong."

A laying hen eats 100 pounds of feed and lays a half-case of eggs (15 dozen) in a production year. For each extra penny per dozen you get for those eggs, you have 15 cents more toward the price of a bag of feed. Fifteen cents on a bag is \$3 on a ton. So let's cut feed costs with egg quality. Every extra cent you get for eggs cuts your feed costs \$3 per ton.

If my case isn't won, let me add one more argument. By selecting the cream from all their farm receipts, a number of midwestern egg packing plants are shipping an increasing number of eggs into the New York, Buffalo, Syracuse and other eastern markets, which makes buyers turn from Nearbys. Should we wait until such eggs are well established in large quantities in our markets (like PEP eggs were in 1931), or should we take them seriously right now?—Johnny Huttar.

BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

Our White Leghorns are making high records in 1950 laying tests. In 1948-49 official egg laying tests, our Leghorns won as follows: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Pennsylvania, Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird). We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks... own two hatcheries with 530,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

A FORUM FOR *Backyard Gardeners*

THE picture below of a corner of our garden is shown to dispel any suspicion you may have that this page is all theory and no practice. And just in case I sound too boastful, let me acknowledge here that Mrs. Backyard Gardener does her share of planning, planting, and weeding.

We do grow lots of flowers, and I consider any practice good if it produces flowers with a minimum of money, time and effort. For example, the books tell me to reset peonies and iris in the fall, to set one good eye or bud of a peony with a 6 to 9 inch root, and not to expect to get bloom the following year. Instead, I dig up the entire plant, split it into 3 or 4 sections, replant one of them and move or give away the others. The roots are disturbed very little, and I do get blossoms the following year. Of course it is necessary to reset only occasionally.

With iris the problem is complicated by borers, but I find it possible to dig up a clump and, by a little searching, to locate and break off the roots that are riddled by borers. To make sure that we have blooms the following year, I never divide and reset all the clumps in any one year.

The "hub" of our garden is the perennial bed shown below. In addition we have a long path bordered on each side with peonies, iris, and phlox, a few delphinium, lupines, lilies, etc. Then back of the garage we have a rose garden; and grouped here and there flowering shrubs such as bridal wreath, mock orange, and deutzia. To complete the picture, we have a few easily grown annuals, such as sweet peas, cosmos, petunias, and zinnias.

You might be interested in some of the flowers in our perennial bed. When the picture was snapped, the poppies had not yet bloomed. They make a great show for a few days—but don't get them started unless you are willing to take the time to keep them under control! Otherwise, they will take over your entire garden. After poppies have finished blooming, they can be

pulled out and a few annuals transplanted to replace them. But even though you think you have removed all the poppies, you will find more than you need next year.

Right now (the middle of June) lemon lilies and Persian iris make quite a show in our garden with their contrasting yellow and blue blossoms. Early in the spring, forget-me-nots and violets made a pretty picture. Then the lupines, followed by a succession of many varieties most of the summer.

Late summer is a period when flowers are often scarce. For that reason we have several clumps of phlox scattered here and there, but this also is a plant that will "take over" unless you keep it under control.

I have never had much success in growing chrysanthemums in the perennial bed. My conclusion is that they need more room. Anyway, by the time they bloom, summer is over and their best use is for cut flowers.

Our perennial bed has not been entirely reset in 9 years. It would be a good thing to do, yet the flowers have never been more abundant than this year, the chief reason being that we were unusually ruthless in thinning last fall. Clumps were dug up and a quarter or less of the clumps reset; some were removed entirely to give more room to those remaining. Then a goodly amount of commercial fertilizer was added and a couple of bales of peat moss spread on the ground between the clumps. In addition to maintaining the humus supply, the peat moss makes the soil easy to work, and weeds and grass easy to pull out. In a coming issue I plan to tell you how we grow roses easily.

* * *

Mrs. L. H. Shaver of Canaan, N. Y., wants information about propagating currants.

Make a mound of earth that covers the shoots and each shoot will send out roots. Then the shoots can be cut off and set out.

—The A. A. Gardener.

WHAT DO POTATOES WANT?

— Seaman-Tilled Seed-Beds

—Because the loose, aerated seedbeds worked by a SEAMAN Rotary Tiller mean faster germination, maximum growth and fully-developed, high-quality potatoes —Because only the SEAMAN Rotary Tiller mixes plant nutrients in uniformly to full tillage depth, making them available to the growing crop —Because the Tiller leaves no plow-sole to seal off subsoil moisture.

Watch the SEAMAN Rotary Tiller in action at the Potato Field Day, or see your dealer for a demonstration on your own farm. For your local dealer's name, write or call the Petzold Equipment Co., 600 5th Ave., Owego, N. Y. See for yourself how this great 4-season machine increases production and builds the efficiency of your entire operation.

Another Dependable **Dr. Naylor** Product

"Windgall? Use ABSORBINE"

says Gustave Troutman, of Milton, N.Y.

"I've been a farmer for 40 years and all that time I've used Absorbine for my horses. I've found it quickly relieves strain and soreness from windgall."

Yes, farmers know there's nothing like Absorbine for helping to relieve lameness due to windgall, sore shoulder, fresh bog spavin and similar congestive troubles. Not a "cure-all," Absorbine is a time-proved help . . . used by many leading veterinarians, too, for helping to relieve puffs, strains and bruises.

A stand-by for 50 years, Absorbine will not blister or remove hair. Only \$2.50 for a long-lasting bottle at all druggists.

Registered Angus Bull For Sale

BARBARIAN CORNELLER 2nd, four and one half years old. Has good offspring which you can see on our farm.
BABCOCK POULTRY FARM, INC.
Route 3A Ithaca, N. Y.

By J. F. ("Doc") ROBERTS

THIS WEEK I saw a cow sell for \$364.10 for meat. She weighed 1655 lbs. and brought 22c a pound. Unusual to be sure, but it does illustrate a good many things about our meat situation and grade cow prices at the present time. It can also cause some pretty serious thinking about our milk prices, heifers, feed and labor costs and the cost of living.

Livestock and meat prices are about in line with farmers' costs but are about the only farm product that is. Some people are yelling that meat should also be sold below the cost of production. Personally I cannot see lower prices before fall, anyway, unless some of the propaganda now going out is effective.

This propaganda is taking a rather new form, namely, that prices for farm products should be so adjusted that foreign countries can export food enabling them to get our dollars and thus save the Marshall Plan many dollars. Perhaps that sort of reasoning is O.K., but it is rather upsetting to know that we are paying taxes to buy farm products to help feed the world, and at the same time be proposing that we lower farm prices through greater imports so that the world may send food here to feed us. Looks like a merry-go-round with brass rings, calliope, and all the pink and red animals that go with it.

Already this is happening; we imported 43,850,684 lbs. of beef the first four months of this year, an all time, peace time, record. Four years ago we imported less than 4,000,000 lbs. That was the first full year of peace. Live cattle imports rose from less than 22,000 in 1947 to over 136,000 the same period this year. Pork imports have risen from 92,075 lbs. first four months in 1947, to 7,010,735 lbs. so far 1950. All this while our exports so far in 1950 are among the smallest on record. It would seem already that livestock farmers were receiving enough competition, but watch it, this seems to be in the propaganda book.

I seldom mention my own farming but this I must get off my chest, and perhaps some or many can do something about it. We have been haying and our hay is heavy and good this year. There is a lot of satisfaction in

cutting, making, smelling, bringing in and seeing hay piling up—IF—there are no break downs and the weather stays with you.

This "break down" problem for me, and many tell me for them also, is really serious. The gasoline engine has become dependable and powerful, the implements it runs or drags around have not kept pace. These implements, in most cases, have become complicated innovations of the horse era, and simply will not stand the power and pounding of our engines.

This is no fault of our manufacturers. They are trying their darndest to make good farm machines—even the best. It really is our own fault. We generally are reluctant to admit our own break downs or do anything about them. The situation is aggravated by most dealers carrying only a few replacement parts which also is economically understandable.

Then too it has been my experience that good know-how farm machinery mechanics are few and far between. There are many good engine mechanics, garage men, and men in greasy overalls but not good on farm machinery.

Cooperation with and through our farm organizations, extension departments, state colleges, manufacturers, dealers and our *American Agriculturist* can, and I hope, will help to relieve a situation that has become really serious with so much farm machinery a must in today's farming.

This is 4th of July Week—to celebrate the independence and liberties of every one of us. If we must fight to maintain our liberty, either here or in Korea, let's do it.

P. S. We have had our early potato and melon plants dusted twice so far this season by airplane. It seems to do a good job and has certainly relieved the farm buildings including our home from flies and mosquitoes. I wonder if this is usual?

— A. A. —

LITTLE DAMAGE

When South Amboy, N. J., was hit by a disastrous explosion a few weeks ago, there were rumors that the plant of the American Agricultural Chemical Co., was badly damaged and that fertilizer production would be seriously curtailed. We are glad to report that the stories were exaggerated and inaccurate. The plant did suffer some damage, but it was not making fertilizer; production was not affected. The American Agricultural Chemical Co., will have its usual booth at the Potato Growers' Field Day at Chaffee, N. Y. on August 3.

Make Your Summer Table Look COOL and COLORFUL

By Dorothy Welty Thomas

EVERY YEAR more and more families are finding new ways to enjoy the out-of-doors. Not just the once-in-a-while picnic, but regular meals taken on the porch or in a corner of the lawn or garden under the trees. To make eating out-of-doors pleasant and enjoyable the whole season through, the table should look cool and dainty. Don't rough it! The menfolk would soon tire of it, and so would you.

If you are going to set your table out on the lawn where it will have to take the wind and weather, paint it and chairs to match with outside house paint or a weatherproof natural wood stain-and-oil finish. White, dark green, gray green, and pale grey are all good colors for out-of-doors. Avoid vivid hues, as they are difficult to harmonize with other colors and are tiring to the eyes.

Use table mats that can be washed, wiped off, or thrown away. Table mats deaden the sound of dishes on a hard surface, save laundry, and look festive. They can also further your color scheme. Beautiful paper place mats are inexpensive and can be wiped off and reused. Paper napkins come to match.

If you want to, you can make your own paper mats from odds and ends of wallpaper. Choose a dainty pattern and a color to match or harmonize with your dishes. Ivy, strawberries and the like are suitable motifs, and plaids are very stylish. It will be necessary to roll the paper backward to take the "curl" out of it. Cut it into 14" by 20" pieces, or a little smaller, and put them to press under a board or books. If the table is to be under cover, you can fasten the mats in place with scotch cellulose tape to make them easier to wipe off after meals.

More permanent mats of various washable fabrics cost a little more than paper ones, but here again you could make your own. Use one color for the mats and another harmonizing color for the napkins. Chartreuse with dark green, yellow with brown, and blue with gray make good pairs of colors.

If the mat is a plain color, you could use a print or plaid for the napkin, or vice versa. Use plain-colored cloth mats with flowered dishes, and printed material with solid-color ware. The ten-to-dollar stores and bargain basements abound in inexpensive dishes that rate as seconds because of minor flaws in the decorating and glazing process. These are practical for carrying back and forth to the porch or lawn. Hostess trays in painted tinware can be purchased for as little as 15 cents each. These might prove a good investment in more ways than one.

You can cook to a color scheme, too, and in summer it's easy to do it. For the back porch supper photographed above, the color scheme was planned and the food prepared within the space of an hour. I began with my favorite dark green lunch cloth and the yellow-green napkins that came with it. With these I used some dishes that came from a ten-cent store basement—ivory white with dark red flowers and green leaves. It's an easy color scheme to match food with. The centerpiece was honeysuckle vine. Its yellow and white flowers and yellow-green leaves gave a yellow-green effect en masse. The vine made a good holder for a few dark red tulips and one yellow one with their stems cut short.

Hard-cooked eggs and dark red beets on lettuce repeated the colors. The food was what I happened to have on hand, but is common enough—ham, cheese, peas, potatoes, and strawberry ice cream for dessert. The same colors could have been achieved with many other combinations of foods that most farm families have in abundance in the summer and fall months of the year.

Just try to think color as well as taste when planning a menu. Make lists of foods that are green, those that are yellow, or red. Have your linen, food, and dishes match or harmonize. It is really fun to do it once you get to thinking about it. You could even have a color scheme just by echoing the colors of your dishes and cloth

or mats in the salad, and then filling in the menu with whatever else you happened to want to have. Your family will "oh" and "ah" when they see how pretty the table can look. And you might take your club out under the maples to have iced tea at a table set with green and white. Put green sprigs of mint in the tea, serve chocolate cake with green icing and you will be famous!

Limit your color scheme to one or two basic colors and white. In using reds, stick to either purple reds or orange reds in one scheme. It takes an expert to mix them. In other words, avoid having roses and tomatoes on the table at the same time. But green goes with everything—and just think of all the things you can do with green! Chop a little chives or parsley in the cottage cheese. Use mint or lime gelatine. Put some green pepper or parsley in your salad. Mint leaves look nice and taste good in lemonade, and nasturtium leaves are a suitable garnish for cold meats.

The centerpiece should be the crowning glory. When cut flowers are not

available or when you want a very cool-looking table, try this: Make an arrangement entirely of leaves and twigs, using two kinds for contrast. Grape leaves are very ornamental. Arrange short pieces of the vine in a low crystal container. Almost any fruit combined with short branches or leaves is attractive. Experiment with a variety of available containers, keeping to the low, shallow ones and use holders to keep the material in place. Your glass baking dishes can be used, or any glass dish that will hold water. Place the dish on a larger, ornamental plate. The greenery will conceal the smaller container. Pairs of refrigerator dishes can be used, too, and look smart. Crumpled chicken wire makes a good holder. The holes should be small enough to keep the stems from slipping.

Ferns, bits of shrubbery, especially the new tips of hemlock and spruce, are useful greens. Myrtle vines train nicely and make a good addition to many other arrangements; also, the tiny flowers of myrtle are dainty and pretty. Next time you walk down a lane, observe the interesting shapes of leaves and small flowers you have always thought of as weeds. Queen Anne's lace is exquisite. I went to a picnic last summer where the tables were decorated with ferns, Queen Anne's lace, and white candles.

In the fall of the year, berries have possibilities and the fields abound in interesting seed pods. You may have so much fun doing table arrangements that you will want to carry it over into the winter months. Try pine needles around a plate of well-polished apples. As the winter wanes, the tree buds swell and you have yellow, brown, orange, rust and rose-colored twigs to choose from. The possibilities are endless. But remember that in summer, green is a cool color and a good harmonizer.

Summer Day

By Edith Shaw Butler

We built a fire of cones and twigs
And watched the smoke curl toward the sky.
We listened to the dry wood snap
And through the trees the wind's soft sigh.
We spread a cloth out on the ground
Where needles of the pine lay thick.
We breathed the fragrance of those pines
Then cut and sharpened, each, a stick
And set out dishes, buttered rolls,
Toasted the hot dogs crispy brown,
Then poured hot coffee into mugs
And, picnic ready, we sat down
And and talked with laughter gay,
Once on a lovely summer day.

Procter & Gamble's great new discovery!

cheer®

So good you get the cleanest possible wash with the least possible work!

SO GOOD it washes clothes cleaner in **ONE** wash than any soap will in two!

After years of experimenting, Procter & Gamble laboratories have discovered a *whale* of a washing product—so good that laboratory tests show it gets clothes cleaner in a single wash than any soap will in two!

SO GOOD you can get a bright, clean wash

even WITHOUT RINSING!

CHEER gives you the cleanest possible wash any "no rinse" suds can offer! Just wash, wring out and hang up to dry! . . . But if you rinse, CHEER's your best bet for a cleaner wash than you'll get with any soap —any other type of washing product.

So good you get a dazzling-white wash with **NO BLEACHING!**
NO BLUING!

Without bleaching, without bluing —CHEER washes white things clean as fresh snow, colored things bright as new paint. Yet CHEER is kind to hands, safe for washable colors.

So good you get a film-free wash even in **HARDEST WATER!**

CHEER suds come up thick and fast in water so hard the best soaps known play out. Leaves no sticky scum —but removes the cloudy film left on clothes by soap. NO WATER SOFTENER NEEDED!

So good you get a whistle-clean wash even **WHEN HOT WATER RUNS LOW!**

The hotter the water, the better the wash. But when the hot water runs low, CHEER suds stand up and go  fighting dirt. Whatever the temperature, CHEER will give you a cleaner wash than any soap, at the same temperature!

THE YOUTH'S COMPANION

Attaching Tarliberry

By MANLEY PIKE

BOSTON, THURSDAY, JUNE 4, 1891

Up at eight o'clock, breakfast at quarter-past, to the office at half-past, work all the forenoon, luncheon at one, back at the office at two, work all the afternoon, home at quarter to six, study all the evening, bed at ten. And begin all over again tomorrow.

And all over again the next day, for this was the way Henry Manson passed every week-day in the year, excepting the fortnight's vacation which he took whenever nobody else cared to take his, so that it either came so early as to resemble a dinner which stops short at soup, or so late that it seemed like getting into church just in time to hear the benediction.

Henry was junior clerk for Pettigrew, Pitts, Pepper & Co., wholesale grocers, who occupied a dark, coffee-scented, granite warehouse in a dark, coffee-scented, granite street, where the roadway roared with enormous trucks, and the sidewalk rattled and banged beneath contrary currents of boxes, barrels and puncheons in a continual state of violent transmission from cart to store or from store to cart.

Inside were more boxes, barrels and puncheons piled as high as the ceiling all over the broad floor. In one corner was the office, and in one corner of that was a desk at which Henry was almost always to be found, writing away at bills and invoices, from morning till night.

It was weary, monotonous work in itself, and worse, promised no future. Henry might continue to write at that desk for years, and then be no further advanced than now; for in the great city were hundreds and thousands of young men anxious for employment, who could do his task as well as he could, and he had never had any opportunity to show himself capable of better things.

Notwithstanding, he drudged faithfully on every day, in the hope that his chance would yet come, and toiled every evening over books which would fit him to take advantage of it whenever it might be offered.

The chance came, as chances generally do, quite unexpectedly, and in a way totally different from any Henry had ever imagined.

It had been a hard day in the office. Two of the clerks were absent, and two more were out on special work, throwing so much more labor on the rest; while the bookkeeper, who thought it due to the dignity of his position never to be in good humor, was in an uncommonly bad one, even for him, and everybody seemed overworked, irritable and discontented.

Henry felt particularly despondent, for he was behindhand with his own duties, and having made several blunders in performing the unfamiliar tasks of the absentees, had been severely scolded by the bookkeeper.

"It's no use," thought Henry. "I might as well give up and try an easier business like coal-heaving, or a better-paid one like car-driving, or a more dignified one such as canvassing or distributing samples of soap."

The poor fellow, who was half-tired out and wholly discouraged, attempted a smile at his own sarcasms, but abandoned the effort before he had fairly

begun.

"Manson!" called Brierley, the bookkeeper, at that moment. "This way!"

"Yes, sir."

"Mr. Pepper wants you," continued Brierley, surlily. "He's in his private room. Come, don't keep him waiting!"

Henry went out, greatly wondering what could be the matter. Neither Mr. Pepper nor any other member of the firm had much intercourse with the subordinate clerks, and a summons to the private room was exceptional.

"Probably I'm to be discharged," said Henry to himself.

He tapped lightly the door of the little inner room and then entered, with a great effort to look unembarrassed and as if it were a perfectly common thing for him to be there.

Mr. Pepper, a stout, dark man with glittering black eyes and speech so concise that all his remarks seemed intended for ten-word telegrams, turned around in his swivel chair to face the junior clerk.

"Saw you studying a commercial law treatise," said he, without the slightest preface.

"Yes, sir," answered Henry, puzzled at this peculiar beginning of the interview. "But not in office hours."

"Been through it?"

"Yes, sir."

"Understand it?"

"Fairly well, sir."

"Know about attachment process?"

"I think I do."

"Good. You're the only man in the office who does, then. Brierley doesn't

—just asked him. Well! I want you to go to Damascus Centre. Right now. Train starts in twenty-seven minutes. Have to look alive."

"Yes, sir," said Henry, who, completely taken aback by the suddenness of this extraordinary commission, was all at sea as to what he might be expected to do.

He soon learned. Mr. Pepper, using about one-third the number of words any other man would have required for the same purpose, explained that Jonas Tarliberry, who kept a general store at Damascus Centre, and who owed the firm a considerable amount of goods bought on credit, was on the point of failure.

Now, since Tarliberry's stock was but just sufficient to satisfy his indebtedness to Pettigrew, Pitts, Pepper & Co., and certain other houses were also his creditors, it was necessary to use all despatch in order to put a first attachment upon his goods. None of the firm chanced to be able to go; and time being wanting to procure an attorney's services, the first available man must be sent.

"You're the one," snapped Mr. Pepper. "Know what to do? Yes? Then do it! Here's a signed blank writ—fill it up yourself. Don't let anybody get ahead of you. Don't spare money. Here's some. Now, off you go!"

Henry found himself half-way to the railroad station before he fairly came to a clear understanding of what had happened, and of the swift change in his situation brought about within the

past few minutes.

"This is my chance, and I'm going to improve it!"

So, in high spirits he dashed into the station and up to the ticket window. Two men were already there.

"One to Damascus Centre," said the first.

"One to Damascus Centre," echoed the second.

"Hallo!" thought Henry, surprised. "Travel up there seems lively to-day."

His turn coming, he stepped to the window, saying, "One to Damascus Centre, please."

The two men turned around on hearing this request, and appearing to recognize him, exchanged a glance. Henry at once understood that his errand would not be accomplished without opposition, for he, too, had recognized them.

One was Browning, of Mace, Nutt & Co., the other, Cutter, of Nash & Cutter, both rival grocery houses, and beyond doubt, likewise creditors of Jonas Tarliberry. They were certainly bound upon the same mission as he.

Browning and Cutter did not speak, but hurried away to the train. They went into the smoker, while Henry, entering another car, sat down to think what he should do.

"Those two seemed to have joined forces," mused he. "Of course, then, their claims are not so large but that there will be enough to satisfy both, and they mean to help each other. And both will unite to fight me, for if I get in my demand first there will be nothing left for either of them. Well, we'll see!"

With a stylographic pen he proceeded to fill in the blank writ Mr. Pepper had given him, which was already signed by the judge, as is sometimes done. The amount of the claim was nearly six thousand dollars, and Henry knew that if he saved such a sum to the firm, his future fortune would be bright, while the failure to secure it would forever end all his hopes of advancement.

"But I won't fail," he declared. "I'll get there first if anybody gets there at all."

He examined the roll of bank-bills which had been given him, to ascertain what his resources might be. To his astonishment he found that he had two hundred dollars.

"Gracious!" ejaculated he. "I'm really not to spare money, sure enough. And it means, too, that Mr. Pepper thinks I'd have trouble. Very likely he knew that the other houses would have the same information he had."

Clearly, the first thing to do was to find out all about Damascus Centre, and the conductor was evidently the man to ask. Henry found that Tarliberry's store was four miles from the Centre station at a place called Mosh-er's Mills, and that there was no regular means of conveyance between the two villages.

"You'll be lucky if you find a team. Damascus Centre's a little bit of a village, and why we stop there I never could see. Sometimes you can get a man to drive you over to the Mills, and sometimes you can't—more can't than can, generally speaking."

"But what shall I do if there isn't a team?"

"Walk, I suppose," replied the conductor, indifferently. "You'll have companions in misery, anyway. There are

Lace Curtains

LACE CURTAINS, or those made of scrim or net, are lovely to look at, but usually present their own special problems when it comes time to launder them. Here are some ideas from readers that you may want to try out:

Mrs. Fred Porschet, Veterans' Hospital, Peekskill, N. Y., irons curtains on an old sheet, folded lengthwise. She pulls the sheet and curtain along the ironing board at the same time and avoids rippled edges and bulging spots.

When Mrs. Clarence Hartzell, R. D. 2, Bangor, Me., hangs curtains, she first pulls each shade down to where she wants the tie-backs and uses the shade rod as a marker.

Mrs. George C. Fox, 72 Steuben St., Schenectady, N. Y., mends curtains which are frayed or weakened on the edges by stitching them across several times on the sewing machine. She also uses corks on the corner pins to hold curtains securely on stretchers.

Mrs. Charles Schrader, R. D., Elba, N. Y., mends lace curtains by ironing a starched piece of net over the hole.

"Have you tried using the bright colored plastic clothespins for tie-backs?" asks Mrs. Mary Billings, Bowdoinham, Me. She says they are very effective, using two pins to the curtain and gathering or pleating the curtain from the edge as the pin is slipped on. The two pins should be wedged together tightly and anchored to the window frame by a piece of string attached to a thumb tack.

Mrs. Jacob Uhlman, R. D. 1, Camp-ton, N. H., makes dishcloths of discarded lace curtains by sewing several thicknesses together.

TODAY IN Aunt Janet's Garden

Martha Washington Geraniums

"Can you give me any information in regard to growing Martha Washington Geraniums? I had one for my birthday and I do want to care for it correctly."

—Mrs. J.R.C.

THE Martha Washington geraniums are closely related to the common form, but their foliage and handsome blossoms are different. Also their season of blooming is not continuous as with the common geranium. Early spring through May and June is their

natural time for flowering. For this reason and also because of their need of a rest period after blooming, many homemakers prefer to buy new plants every year.

However, if you have a suitable place to keep the plant growing through the winter, you may want to try to make yours flower again next year. In this case, put the pot in a sunny situation out of doors until September but see that the roots do not become dry at any time. In September the old sprouts should be cut back and repotted. Then if you had a cold frame where you could keep the plants until October, that would be fine. If not, you probably would have a protected porch or some spot where the plant could be protected from frost. When really cold weather comes, it should be given the regular care which potted plants require during the winter. Warmth, moisture, and enough light are needed to prevent it from becoming leggy.

If you wish to make cuttings from the plant which you already have, mid-summer to the first week in September is a good time. A flat box of pure sand, or half sand and half loam, makes a good rooting mixture. Break off a branch with a "heel" of old wood and insert it in this mixture; see that the soil is kept moist but well drained, and in two or three weeks the roots should have started. After the roots are well started, put the young plant into a pot containing a good potting soil, namely equal parts of loam, leafmold, and sand. Immediately after transplanting, keep the plant in good light but away from direct sunlight for about a week; then it can be moved into direct sunlight. Yet do not expect blossoms from this particular plant before May or June.

As long as the plant grows satisfactorily, leave well enough alone. Over-fertilizing is as bad as too little. If it does not thrive, scratch in one teaspoon of complete fertilizer, such as 5-10-5, around the edge of the pot and water it in well. Once or twice during the winter ought to be enough for this treatment.—G.W.H.

ATTACHING TAILORERY

(Continued from Opposite Page)

two men in the smoker who've been asking me the same question. The three of you might keep one another company—if you happen to fancy it."

The conductor walked off winking. The "two men in the smoker" had manifestly given him some idea of the situation of affairs.

Henry sat through the rest of the journey in an unpleasantly nervous frame of mind, longing to do something, and yet it was quite obvious that he could at present only wait to see what might turn up.

If his rivals obtained the only conveyance, what was to become of him? And if there were no conveyance at all, what then?

It seemed to him that he would gladly sacrifice a year's salary for the monopoly of any sort of vehicle which would get him to Mosher's Mills half an hour ahead of that pair in the smoker. His first work at the Mills would be to find a constable to serve the attachment, and this might take more time than he could spare.

Before long the engine whistled, and a look at his watch told him that this must be Damascus Centre. He rushed out of the car, and standing on the lowermost step, made ready to swing off the moment he could safely do so.

Yet, quick and prompt as Henry was, he forgot the very simple, self-evident fact that the first car of a train reaches the station before the last car does.

When he sprang upon the little platform at Damascus Centre he saw Browning and Cutter running across the upper end, and tumbling into a dilapidated old carryall which he instantly perceived to be the only carriage anywhere in sight. He darted toward it, shouting to the driver to wait for him.

(To be continued)

Cool and Crisp

No. 3026. One of the smartest sundresses of the season—and one of the simplest to sew! Sizes 10-20; 36-40. Size 16, 4 1/4 yards 35-inch. (For same style in girl's sizes 6-14, order Pattern No. 2128, which takes 3 yards 35-inch in size 8.)

No. 2108. Ice cool classic! Kimono sleeve shirtwaist can be made strictly tailored or touched with feminine eyellet V's. Sizes 12-20; 36-42. Size 18, 3 3/4 yards 35-inch, 5 3/8 yards trim.

No. 2174. Very grown up, indeed, is this halter sun-dress and cover-up cape. Sizes 1, 2, 3, 4, 6. Size 4, dress and cape, 2 1/4 yards 35-inch; 5/8 yard

35-inch contrast. Panties, 3/4 yard 35-inch. Applique included.

No. 2847. Cap sleeve two-piece to wear whenever you want to look your coolest—and your trimmest! Bloused and belted jacket. Sizes 12-20; 36-46. Size 18, 4 3/8 yards 35-inch fabric.

SUNNYGABLES GARDENS

By Emilie Hall

ABOUT this time every year it becomes my pleasant assignment to have a look at the Sunnygables gardens, talk with the girls and report here what's growing and cooking.

Like the rest of Sunnygables operations, the family gardening comes in for its share of experimenting and pioneering, always, of course, slanted towards doing the best job possible in the shortest time and with the minimum wear and tear on the gardener.

Sprinkler irrigation, a garden tractor, and even a somewhat different garden lay-out are the new things which have been added this year, and under the supervision of Marcella Yaple they promise to pay off with enough vegetables and small fruits to supply the needs of three families for the year. Sharing the produce of the garden will be the Yaples, Conners and Babcocks. Each group also is contributing either financially or in work to the job of production.

Garden Crew

Marcella, who has the greenest thumb in all the Sunnygables group when it comes to gardening, is in charge of the operation. Daughter of a market gardener, she was coaxing fruits and vegetables to grow a little bigger almost as soon as she could walk. Now her early training is being put to good account. Despite a very busy home and civic life—she has three children, is active in Home Bureau and heads up a troop of Brownie Scouts—she manages to spend at least a couple of hours daily in the garden which is a full two miles from the house. Just getting there involves some organization and planning. She goes down as soon as the children get in from school, taking them with her. Frequently she takes along a picnic supper and they eat beside the creek.

Jean Conner, mother of a two-months-old son, makes her contribution by taking care of Marcella's two younger children during gardening hours, thus freeing the mother to devote her entire attention to the job at hand.

For the garden site, a strip 600 feet long and 30 feet wide was selected at the edge of a field where oats were grown last year. The fact that the oats were liberally sprayed with weed killer was a help in preparing the soil this year. Readers of Kernels, Screenings & Chaff will have little difficulty locating the garden in their minds if they are familiar with the field south of the house and at the foot of Newfield Hill where sprinkler irrigation was used last year. The garden strip parallels the highway at the edge of this field.

One of the real problems this location presents is that grasses of various types have always grown luxuriantly there. In spite of all Marcella can do, her battle against the grass for which Sunnygables is famous is sometimes discouraging.

Tractor

When the garden tractor arrived, she thought her troubles would be over, only to discover she wasn't "man" enough to control it. This tractor is the walking type, and while I'm perfectly ready to admit that walking behind a garden tractor has it all over

—Photo by C. Hadley Smith

ON THIS PAGE in the July 1 issue of *American Agriculturist* I showed, in a series of pictures, the method we used to fill our trench silo with a completely mechanized outfit but one in which was invested a minimum amount of money. The above picture shows the finished job. The boys filled forty feet of the fifty-foot long trench with 250 tons of *unchopped* alfalfa-brome grass. One field was about 50-50 and another had about 70% alfalfa. Grass from 25 acres was gathered and dumped into the ditch by one man using a hayloader and our 12-year-old dump truck. The trench was filled from the high end with the truck backing over the grass to pack it as it was filled.

To control the amount of fermentation in the unchopped grass, Jack Conner treated it with sulfur-dioxide gas as it was filled, using a total of 1,200 pounds. The wetness of the grass causes a chemical reaction in the sulfur-dioxide that actually changes it into a milu sulphurous acid. This then serves to keep the pH of the silage about where we want it.

With the unchopped grass all in, the boys built a wall of waste baled hay right across the open, vertical end of the silo and then covered the heaped-up top of the silo

with 1½ to 2 inches of ground limestone which formed a cement-like cover just as soon as it got wet. The limestone will go back on the land as the silage is fed out.

We are very much aware of the chances we are taking in putting up unchopped grass by this low-cost method. Jack Conner, who expects this trench full of silage to feed his herd of Brown Swiss next winter, says that this is *the* way to make grass silage but, like me, is anxiously wondering about how it will turn out when he opens the silo next November. One problem that had us worried has been solved. The unchopped silage will be cut with a hay knife to keep the opened end vertical, and the silage will be thrown out in these cut-off slices into our feed-bunk wagons.

In the upper left hand corner of the above picture may be seen the ends of strips of rubber film. They were put in between the earth and the grass to see if they will protect the walls of the trench from rains and thawing after the silage has been removed. The boys also put the strips over the open end of the trench before stacking up the baled hay. The ends are held down by the limestone.—H.E.B.

pulling weeds on one's knees, I still have to see a horse-drawn cultivator that gives a man such a going over.

Even so, the tractor is a great time-saver. It will do the entire garden in about two hours. One thing which speeds up the cultivating, even with the tractor, is the layout of the garden—a few very long rows instead of the traditional square or nearly square layout with many rows. Most garden tractors do not have a reverse gear and must be wheeled heavily on the turn. A narrow garden in long rows cuts down on frequent turning of the machine.

Of course, planting like this required a little more planning so that produce of similar size would be in the same row. For example, one row has carrots, beets, lettuce, spinach, etc. Corn is in a section by itself, but the rows line up with the rest of the garden, and the peas are in two rows which run the entire length.

Mulching the Berries

When planning the new garden, space was saved along the fence and at one end for blueberry bushes, and a variety of raspberries and currants. The raspberries and currants were to be mulched with straw, but in cleaning out a silo someone had the idea that the old grass silage would make good mulch. Marcella, interested always in trying something new, is keeping her fingers crossed. The old silage is much easier to handle than straw.

The blueberries have been mulched with sawdust to keep the moisture in the soil and help sour it. They will re-

quire more water than most of the other plants, and a special irrigation pipe is being set up in the patch.

A new strawberry patch is mulched with straw, of course, and all blossoms are being picked as fast as they come out this year to give the plants a chance to grow strong.

Asparagus

Mouth-watering in its potentialities is the long row of asparagus—around 400 roots as I recall. It was planted 10 inches deep, and in four weeks was in fern. They will let it go for two years, then cut it for four weeks the third year, and after that revel in all they can use. In checking up on the management of an asparagus bed, Marcella learned that it is best to cut or break the stalks above the ground, rather than right at ground level. The latter practice, it is claimed, often damages new young shoots coming on.

Garden Greens

One of the things which appeals to me about the garden is the wide variety of greens—enough different kinds so that even the fussiest eater should be assured of finding a plentiful supply of greens to his liking. In addition to leaf and head lettuce, there are romaine, kale, endive and spinach. Each of these is planted in relatively small sections and plans call for replanting for late harvest after the first crop is nearly mature.

Freezing

Of course, all this work and planning, as K, S & C readers know only

too well, is just preliminary to the days when all the produce we cannot eat direct from the garden must be frozen or canned. About the only plans the girls have to date for freezing is "to get the stuff in the freezer the quickest, easiest way."

Marcella is going to freeze tomatoes for sauces and casseroles again this year. She also plans to freeze corn on the cob without blanching. She will merely shuck the ears and seal them in locker bags.

Mrs. Babcock, who was in on the ground floor in freezing, still tends to follow the recommendations of Cornell rather closely and, so far, there aren't any radical changes in recommended procedures. Some people are having what they consider rather good luck freezing without blanching, but, as one expert told me last year when I asked about doing asparagus without blanching, "It's all right to do it that way if you don't mind eating grass silage next winter." I tried some anyway, and found she was right—the stuff did taste more like silage than asparagus after it had been in the locker two months!

One thing a friend of Mrs. Babcock's discovered, and passed along for others to try—she claims that cauliflower and other "strong" vegetables are more digestible after being frozen than when served fresh. The blanching, freezing and cooking process seems to take away some of the sharp flavor which frequently leads to indigestion.

NON-CANCELLABLE

Last fall a paint salesman called on me several times and tried to sell me paint. The barn needed painting, but I couldn't do it last fall and I wasn't sure I could afford to do it this summer. However, the salesman said I could place the order but that the paint wouldn't be shipped until spring, and that I could cancel the order in the meantime if I wanted to. I did cancel the order. Nevertheless, the paint arrived around Christmas time, and the company insisted that I pay for it.

We have not seen the order our subscriber signed, but we venture a guess that there was a clause stating that the order could not be cancelled. It is not wise to accept a salesman's promise, especially if it disagrees with what's printed on the order. Generally speaking, it is difficult to cancel orders which are given to agents who call on you at home.

— A. A. —

RENEWAL POLICIES

About a year ago we received a fire insurance policy which was a renewal of one we previously carried. We didn't want it and intended to return it, but we neglected to do so. Now the agent wants us to pay for it. It seems to us that we shouldn't be expected to pay for something we didn't order.

Many property owners would object seriously if the agent handling their fire insurance didn't renew the policy when it expired; otherwise the owner might overlook the expiration date and be without protection.

It is common practice in the insurance business to mail renewals. Therefore, if you receive a renewal policy and do not want it, it is only fair to return it promptly or notify the agent to that effect, in which case it is his responsibility to pick up the policy.

— A. A. —

FORGOTTEN?

About a year ago I gave \$10.00 to John H. Thiele, Jr. of Hawthorne, N. Y., for which he was to ship me a pair of Pearl Guinea Fowls. I did not receive them, neither have I received a refund. I have my receipt.

We wrote Mr. Thiele about this twice. Mrs. Thiele replied to our second letter that Mr. Thiele was out of town and would check the order book when he returned. That was back in February, and the last we heard of the matter, although we have sent several reminders. We are publishing the record for the benefit of our readers.

— A. A. —

"THANKS"

I received your letter in regard to the insured parcel which was damaged in the mail. I thank you so much for what you have done, as this was the first satisfactory information I have had since I tried to collect damages. This is the second time you have collected money for me on which I could not get action myself.

After I first subscribed for the Agriculturist and bought N. A. Insurance (in 1923, I believe), I was just a little sorry that I let an "agent" talk me into subscribing for just another magazine which I probably would never read (so I thought then). I have missed reading very few issues from cover to cover all through the years; and as soon as each of my children became fifteen years of age, I took out accident insurance on him or her also. Thank goodness none of us has had to collect on that.

The Agriculturist is the one paper we will never be without, as I have read it so long I feel like I know all of the people connected with it.

—Mrs. S. J. C., New York

THE SPRAY THAT DIDN'T HAVE TO CHANGE ITS FORMULA..

Gulf Livestock Spray

is just as quick-acting as it is trusted, proved, reliable!

One of the facts of dairy life that has been demonstrated year after year is the unsurpassed safety and effectiveness of Gulf Livestock Spray in use against most of the insects that commonly pester dairy cattle.

contains only PYRETHRINS (nature's own insecticidal ingredient) boosted by PIPERONYL BUTOXIDE.

Yet Cows Get PROMPT Relief

This safety factor doesn't for a minute keep Gulf Livestock Spray from ACTING FAST to kill or repel many insects that sap your herd's energy.

That's because those same natural PYRETHRINS, given super-charged power by the addition of PIPERONYL, are tops for lightning-quick wallop.

Clear Case of "Eating Your Cake and Having It, Too"

—when you can get both assured safety in use and maximum speed in results, both killing power and repellent action, all in one spray!

But that's what you (and your cows) will find in Gulf Livestock Spray. Get a supply real soon—

**and money-back guarantee
of satisfaction, besides!**

Safe Insecticidal Ingredients

Used as directed, Gulf Livestock Spray is completely safe for dairy cows and their milk because it is a non-staining, non-gumming and very highly refined base oil which

For milkhouse use—get Special Gulfspray!

Special Gulfspray is a fast-acting space-type spray that quickly knocks out of the air, and kills, insects enveloped in its mist.

It's laboratory-formulated for use in milk plants and other places where safety gets top priority because the handling, processing or storing of foodstuffs is involved. So it's perfect for use in your milkhouse, too!

Used as directed, Special Gulfspray will not impart odor or taste to the milk. Usual prices: 1 gal., \$2.95; 5 gals., \$12.95

THE FARM PAPER OF THE NORTHEAST

It's an Everlasting Fight to Get **CLEAN APPLES**

By Dan Dalrymple

SECRETARY, NEW YORK HORTICULTURAL SOCIETY

YOU CAN never pose as a modern fruit grower until you have dusted all night, or most of the night. Driving a tractor down through an orchard which is streaming with water from every branch, with a screeching duster at your ear, headlights trying to pierce the downpour, and irritating sulphur dust going up through the trees is quite an experience. Once in awhile a branch takes off your rain hat and water pours down your neck. This is a sensation that all good fruit growers should not miss. Of course when you stop the duster, your ear goes right on ringing for a day or two, and when you finally get off the thing and start to get some sleep, the sulphur particles start to drip down in your eyes and you have a rare time of crying out your troubles in your pillow.

The main feature of this year's job of growing fruit has been the difficulty in controlling scab in New York State. In the Hudson Valley, the almost continuous rains made the job difficult in spite of new materials and new methods. The weather forecasters were off base and were unable to predict several severe rain periods in the Hudson Valley. They missed the boat badly at least twice in western New York. Consequently, the biggest problem now being discussed by fruit growers over the back fence—with suitable expletives—is "How bad is your scab?"

Our standards of scab control have gone up through the years. What we used to regard as inevitable we have now come to regard as unnecessary. We do not like it when we get caught, and, like most human beings, we have to blame it on some one, be it the hired man or the spray material or the equipment—anybody but ourselves.

But let us start at the beginning. My prediction that a few growers would not use the dormant sprays this year, hoping to handle their insect problems with parathion

later, was correct. Since this happened to be a rosy aphid year, some people have already taken losses by leaving out dormant sprays. Bud moth increased in some orchards, not because parathion was not effective but because it could not be applied as the grower wished in the rush of events. It was also upsetting to find that parathion caused considerable damage to McIntosh.

About calyx time the rain really began to bother us in western New York. Memorial Day we had a deluge and some of the 3-day rain periods which had been bothering the Hudson Valley all spring began to catch up with us. The dusters started to screech night and day, and the growers were screeching when the dusters were not. Many of us sprayed in the rain when we could not dust as much as we wanted to, using paste sulphur and really piling it on. We ran out of rain caps and had to borrow hats, boots and dusters to keep our gang all working. Fortunately, one of my neighbors who had a small acreage loaned me his duster one night after he got through.

In spite of all our dusting and spraying in the rain, we still wound up with some leaf and apple surface wide open for longer than necessary to get scab started (12 to 14 hours). This is when you begin to appreciate some good loyal workers who will put in the extra punch when you need it. A man who will get up at 6 o'clock, after having worked till 2 or 3, and start spraying is a true jewel. If you do not think so, try it yourself!

We observed in the past that getting out promptly after the rain and putting on a good fine flotation or magnetic sulphur spray helps keep down scab.

After studying last year's results with the mercuries, we had stocked up quite a bit of these materials, just in case; so the "morning after" found us pouring in the mercury along with sulphur to try and knock out the spores that had already gotten into the leaves. Many growers did this all over the State, judging from the big sales of mercuries. Of course, a few expected too much and did not get the results after three days that some of us did 24 hours after infection started.

Some growers, watching their costs, kept one eye on their pile of materials and tried

Getting Down to Business

G.L.F. Laying Mash

A Practical feed for farmers who make their living from poultry

When the "pee-wee" eggs begin to appear and the pullets are moved into their laying quarters, they are finally beginning to pay part of the costs. At this stage a radical change takes place in the life of a pullet — she no longer eats just to grow and develop — from here on she eats for egg production too.

Getting the most from every hen

Every pullet going into the laying house has an inbred ability for egg production. The care and raw materials she

receives determine the outcome. That's why the laying mash she receives must be formulated for economical egg production as well as growth and health all through the laying year.

G.L.F. Laying Mash has been doing just this on more than 100,000 farms year after year. The combination of a farmer-owned feed business — nutrition facts from poultry scientists — modern mixing plants and community service can't be beat as a way of doing the job.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

G.L.F. • *for Complete Service on Poultry Feeds and Equipment*

Grass Silage for Summer Feeding

HORACE NEUBAUER of Whitney Point, New York, has been putting up grass silage with molasses for three years. His reason for starting the practice was that he never seemed to be able to get a nearby field of alfalfa into the barn in good shape as long hay.

The grass is raked, one swath to a windrow, with an ordinary side delivery rake, loaded with a hay loader and chopped with about 40 pounds of molasses to the load. The molasses is mixed with an equal amount of water so that it will run easier. The grass is allowed to wilt somewhat before it is raked, frequently being mowed in the evening and raked up after the dew is off next morning. This grass silage is used for summer feeding and the silo

is refilled with corn in the fall.

Commenting on the milk producing qualities of grass silage, Mr. Neubauer said that in his opinion No. 1 corn silage was better, but that grass silage was superior to poor corn silage.

Mr. Neubauer expressed another opinion from his experience which is interesting. He has observed that when grass silage is put up without a preservative there is less likely to be spoilage where it is grown on gravel soil than on heavy hill land.

The filling of the silo shown above had recently been completed, but there was no evidence of drainage of moisture. In fact, the silo has a drain which we inspected, and we found no liquid draining from it.

Shirley May Meacham gets a ride from the hay-field to the barn. She and her Dad, Albert, have been making hay on the farm of Russell Young at Randolph, Cattaraugus County, N. Y.

PENNSYLVANIA F. F. A. OFFICERS

Here are the officers of the Pennsylvania State F.F.A. for the coming year: Seated from left to right—Carl Chess, president, Sandy Lake, R. D. 2; James Bistline, vice president, Landisburg; Ray Miller, secretary, New Oxford, R. D. 2; Richard Hess, treasurer, Strasburg, R. D. 1. Standing from left to right are: Fred Fornwalt, sentinel, East Freedom; Robert Leight, chaplain, Quakertown, and John Kozlowski, reporter, North East.

Dairymen's First Choice

Exclusive "Controlled Milking" Features Make
the Great New DE LAVAL MAGNETIC SPEEDWAY
MILKER the Choice of Good Dairymen Everywhere

■ Every day more and more dairymen are coming to realize that only the De Laval Magnetic Speedway Milker gives them a combination of features that completely satisfies their exacting needs.

Only in the De Laval Magnetic Speedway Milker is all possibility of chance, or guesswork on the part of the operator removed. From pump to pail there is positive automatic control at every vital point.

First and foremost of De Laval's "Controlled Milking" features is the exclusive De Laval magnetic pulsation control that assures precisely the same milking speed and action day after day, regardless of who operates the milker. The result is highest milk production. *No other milker has this feature.*

Then there is the completely new, one-piece design "Full-Flo" Teat Cup that milks fast and completely with perfect cow comfort. It maintains proper position on teat and *cannot creep or crawl*. Nothing could be simpler to assemble, disassemble and clean.

And never was a milker easier to

operate. Requires no harness or other adjustments. Correct vacuum, line drainage, stall cock and sanitary trap action—all automatically controlled.

Cleaning is simple because of the unit's all stainless steel construction . . . large-mouthed pail . . . "straight-through" milk claw with removable bottom . . . easily assembled and disassembled "Full-Flo" Teat Cup with one-piece liner.

Yes, for a better, more profitable, easier job of milking, the De Laval Magnetic Speedway Milker offers good dairymen everywhere an exclusive combination of unmatched features.

FOR DE LAVAL-QUALITY MILKING AT LOWER COST

The New De Laval STERLING SPEEDWAY Milker has every "Controlled Milking" feature of the Magnetic Milker except magnetic pulsation control. No other milker of the same type milks better.

IF

HOWARD EDWARD BABCOCK

THE first time I ever saw Ed Babcock was in the winter of 1916. I was a teacher of agriculture at Interlaken, N. Y., but had become interested in the new Farm Bureau work. So I went to the New York State College of Agriculture at Ithaca to talk with M. C. Burritt, then State Director of Farm Bureaus, and with the Assistant State Director, Ed Babcock. Ed sent me down to meet the Farm Bureau executive committee in Delaware County.

From that time until Ed's death on July 12, it was my privilege to team up with him on many of his enterprises, and especially to have the privilege of his friendship. I never knew another man with such boundless energy. It was difficult to keep up with him when he walked, or when he thought and worked. He crowded more into his 61 years than most men could crowd into a hundred. In every sense of the word, Ed was a pioneer, with more vision than anyone else I have ever known. Few people realize the transformation and changes that have taken place, especially in our agriculture, in those 34 years since 1916. In many of those changes Ed was a leader. No one has so well expressed this thought as a friend who wrote me since Ed's death:

"Probably no other man in the field of agriculture has jarred time-worn patterns more violently."

When other men's thinking became confused and fuzzy, Ed would sit down with his pencil, and with his almost prophetic thinking get whatever plan they were working on going in straight lines again. Unlike many other men with new ideas, Ed was able to get his accepted because he liked folks and they liked him, and therefore they had confidence in him and accepted his leadership.

No one will ever know the great number of young men and women whom Ed Babcock helped to new and better jobs, and particularly for whom he renewed enthusiasm and challenged to do bigger and better things. In fact, "challenge" was a favorite word with Ed. To him there was always a better way, and he challenged organization and institution leaders, his friends and, above all, he challenged himself to find that new and better way.

Back of the achievements and contributions of almost every great man is a great woman. Ed was indeed fortunate in his wife, Mrs. Hilda Babcock, and his children Howard, John, and Mrs. Barbara Babcock Hirshfeld. Like most other wives of prominent men, Hilda Babcock is quiet, retiring and seldom in the public eye. But when Ed came home from a hard trip, when he was tired and upset, Hilda was always there with a beautiful, well-managed home and her understanding affection. She will continue to live at Sunnysables.

At a time when the world and this country of ours are so desperately in need of leadership, it is a calamity to lose a man like H. E. Babcock, even though the works which he started will go marching on. Worse still to bear is the vacant place in our hearts, in the hearts of his friends, who are legion. We can say of Ed Babcock, as Edwin Markham said of Abraham Lincoln:

... He went down

*As when a kindly cedar green with boughs
Goes down with a great shout upon the hills
And leaves a lonesome place against the sky.*

DAIRYMEN ARE LOSING CONTROL

SECRETARY of Agriculture Brannan's latest plan (see Page 6) to centralize control of milk marketing is just one more step—nearly the final step—toward taking all control of the dairyman's business out of his hands and that of his milk marketing organizations, and putting it in the hands of bureaucrats and politicians.

When the milk marketing Orders were started in the Boston and New York milk sheds, dairymen and their organizations entered into the agreements with the understanding that there should be full cooperation between Department of Agriculture

By E. R. Eastman

officials on one side and the dairymen and their organizations on the other. It worked that way for several years, but the situation has been changing rapidly in recent years. Milk hearings where dairymen furnish evidence of their costs and the conditions under which milk is produced have become a farce. The Washington officials listen, and then apparently go back to Washington and make their decisions without regard to the evidence. Probably their minds are made up before they even come to the hearings.

With control of milk prices entirely centered in Washington, it is plain that dairymen will continue to get the dirty end of the stick. Politicians are interested in votes, and on that basis the farmers are outnumbered by consumers and don't have much chance.

We have a new milk formula for determining prices in the New York milk shed which, if let alone, will result in considerably better prices this fall and winter. But with all controls centered in Washington and with a war on, there is the chance that the formula will be ignored and a ceiling put on the farmer's milk prices. Dairy marketing organizations have a difficult responsibility to keep control of milk marketing policies in their own hands.

The situation is further complicated by the fact that Central West milk producers are growing increasingly jealous of our better milk prices—which we have to have to meet the high sanitary requirements of New York City—and because we are near the biggest and best market in the world. Western producers and their organizations are apparently willing to go along with the centralization of most of the milk control in Washington in order to put all prices on a national basis.

The milk marketing orders, with their pooling provisions, have been helpful in giving dairymen higher prices for all of their milk than they could have had without the pool, but dairymen familiar with the facts are beginning to wonder now whether the milk marketing agreements or Orders will be worthwhile if they are one hundred per cent controlled by the Washington bureaucrats.

WHY WE HAVE WARS

IN MY TIME the United States has been engaged in five wars—the war with Spain in 1898, with the Philippines, two world wars, and now Korea, which could lead to the worst one of all. Two young men, both of them former officers in the Army and likely to be called in the present conflict; have said to me lately:

"Why, it seems as though I have just got home, and now probably I've got to go again. What's it all about?"

Millions of people throughout the world are asking that question. Why another war when the great mass of people in every country want peace? The answer, of course, is either evil or foolish leadership. Germany had its Kaiser and its Hitler and their gangs; Russia has Stalin and his gang; and once these gangs are allowed to get control, war is almost inevitable.

It was necessary, of course, that we interfere in Korea. We should have interfered in China. But with all people really wanting peace, it would seem that there ought to be enough good and wise leadership in the world to control the ruffians before it is too late to prevent the wars. Yet even in our own Republic, the people refuse to accept the responsibility of good citizenship. We neglect to vote. We often do not elect our best and wisest men to office. We let the politicians put politics first. We demand that government do the things we should do ourselves.

With our own soldiers dying in Korea right now, we have in the United States the spectacle of a confessed traitor demanding light bail and an easy sentence; we have the spectacle of a congressional committee whitewashing investigations to find and

oust traitors in our own government; and we see our government leaders wasting billions of dollars to create a socialistic welfare state when those billions should have been saved for emergencies like the present one, without need to ruin the country by higher and higher taxes.

GARDEN HARVEST

LAST NIGHT when I got home from the A. A. Office I went down into our big garden. I pulled a hill or two of potatoes and was surprised and pleased to find some large ones that we can start using right away. Digging potatoes gives me the same feeling that prospectors must have when they dig for gold.

The vegetables almost covered the ground, and there was hardly a weed to be seen. Tomatoes will be ready in a few days, golden summer squash is peeping out through the big vines, cucumbers are almost ready to be picked, 150 pints or more of peas are picked and in the freezer; so are the string beans, the strawberries, and the raspberries. Corn is tasselled and is coming fast.

There is something about growing crops that is the breath of life to us who love farms and the country.

TO MAINTAIN PRODUCTION

THIS IS THE TIME of year when cows tend to go down in production. Once down, it is almost impossible to get them back. The grass of the pastures, particularly in unimproved pastures, has lost its savor. It is dry and its food value is greatly reduced. Farmers need not be told that hot weather and flies also cut down milk production.

This is where improved pastures are a godsend. But poor pastures can be supplemented by your new grass silage, by the aftermath of the meadows, and a very careful feeding of grain, given only to your best cows and in proportion to their production.

THE FEED-EGG RATIO

NOTHING shows more plainly what poultrymen are up against than a comparison of the feed-egg ratio now with the same week last year. The value of a case of eggs over feed costs during the week ending July 8 last year was \$8.40. Now it is \$3.93, or less than half of what it was last year. There is a brighter side to the picture, however, with some indications of better prices.

Even with this greatly reduced income, good poultrymen are staying in the black by thinking and working all the time to improve their practices and keep their costs down.

IT'S LIGHTNING TIME!

LIGHTNING RODS are almost perfect protection for buildings when they are properly erected and grounded. They are far worse than nothing if they are not well grounded.

It's lightning time. Check your lightning rod grounds while you think about it!

COMING! COMING! COMING!

MR. VERNE L. BeDELL of the Northern Pacific Railway came to Ithaca the other day to talk with our staff about more of our famous *American Agriculturist* tours.

As a result, there will be an *American Agriculturist* tour to California and the Southwest next February, and another tour to Alaska early in August, 1951. Descriptive literature will not be available for some time yet, but we are announcing these tours now so you can make your plans.

The hundreds of people who have gone on these *American Agriculturist* tours testify enthusiastically that there is no other tour and no other way by which they can see so much and do it so comfortably and get so much happiness for the money spent as they can on our tours.

Mark these dates on your calendar and start planning to take one of these wonderful trips.

AA's Farmers' Dollar Guide

WAR?: Again farmers are growing crops and raising animals at a time when the future is extremely uncertain. While it looks now as though the future might bring armed outbreaks in widely separated areas around Russia's border, requiring continued U. S. military preparedness, no one dares predict what will happen. However, World War II was sufficiently recent so that most of you know the probable course of events if we get into a full-scale war.

HOARDING: One result of the conflict to date has been food hoarding, which is unnecessary and unwise as the following figures show:

MEAT: Livestock numbers on farms are the largest in 6 years. Meat production this year will be about 22 billion pounds to give per capita supply of about 145 pounds, which is 5 pounds above the current rate of consumption.

WHEAT: Estimated carryover of wheat on July 1 was 450 million bushels, and demand plus probable exports should give a bigger carry-over next July 1. Even so, as insurance, USDA has increased the 1951 wheat acreage allotment by about 7 million acres, making the figures 72.8 million acres.

DAIRY PRODUCTS: Estimated 1950 milk production of 120 billion pounds would be exceeded only by 1945. Government holds 192 million pounds of butter, 322 million pounds of dried milk, and 80 million pounds of cheese.

POULTRY: Egg production is at a near record level. Production of poultry for meat is below last year but above average.

VEGETABLES, FRUIT, SUGAR: Vegetable production is ample. Fruit production will be below last year, but will not be a short crop. SUGAR import quota has been increased by 350,000 tons, and there is plenty more in Cuba.

FEED GRAINS: Production of feed grains this year will be about 5 billion bushels. Domestic consumption will be about 4.7 billion bushels and exports about 100 million bushels.

In view of the foregoing figures it is probable that hoarding will die down shortly; if not, it may bring price controls and rationing with all their headaches.

BOOMLET: If the so-called business "boomlet" is temporary, it will hurt farmers more than it will help them because it will increase costs faster than it will increase returns. If we get into a big war, which everyone hopes will not happen, prices of farm products will eventually increase faster than production costs.

CROPS: The overall picture is for U. S. crop yields somewhat less than either of the past 2 years but larger than in 5 of the last 8 years and much higher than any year before 1942. Here are estimates of some important crops from the July 1 Crop Report:

Crop	Unit	New York		United States		
		1949	1950 Indicated (,000 omitted)	Average 1939-48	1949	1950 Indicated
Corn, all	bu.	29,610	31,374	2,900,932	3,377,790	3,175,602
Wheat, winter	bu.	11,676	11,564	758,821	901,668	720,545
Wheat, spring	bu.	84	80	272,491	244,795	236,041
Oats	bu.	22,591	31,278	1,274,474	1,322,924	1,394,772
Hay, all	ton	4,878	5,601	100,344	99,305	103,498
Beans, dry	100 lbs.	1,638	1,572	17,367	21,554	17,186
Potatoes, L. I.	bu.	12,420	17,340			
Potatoes, upstate	bu.	18,240	15,870	403,284	401,962	390,431
Apples (commercial)	bu.	20,090	18,095	109,408	133,742	119,180
Peaches	bu.	1,428	1,023	70,090	74,818	55,512
Pears	bu.	1,195	1,033	30,295	36,404	28,488
Grapes	ton	48.4	64.7	2,776.9	2,662.1	2,748.1

† Equivalent grain corn production from all corn acreage for harvest.

The estimated potato crop, better than 390 million bushels, is only 3 per cent below last year though acreage is smallest since 1876. The expected production is about 40 million bushels over the anticipated demand; therefore, potatoes will continue to be a price support problem.

The Song of the Lazy Farmer

THIS is the time of year when I and neighbor tell ourselves a lie; when summer work begins to slack, we go into our quick-change act. With lots of time for visiting, each of us swears that not a thing, this time, will get a chance to faze our plans for changing all our ways. My neighbor always starts it off, complaining 'bout his back and cough; "I've worked too hard this year," says he, "and it's not worth the wear on me, so next year I shall be like you and get enjoyment from life too; I figure no amount of wealth is worth an ailing state of health."

Then comes my turn and so I say, "You know, I think that it might pay if I'd forget that work is grief and try to turn a brand-new leaf. So next year I am going to work and no more chores I'll ever shirk; Mirandy will not have to toil to make a living from our soil; that job a man's supposed to do, with being lazy I am thru." And then we both grin foolishly, because we know full well that we don't really mean a thing we've said; why neighbor surely would be dead if he should operate like me, and work would kill me too, by gee.

More Ears, Fewer Husks
Faster Picking

NEW IDEA One-Row Picker enables one man to harvest up to 17 acres of corn daily. NEW IDEA Two-Row Picker (below) handles up to 18 acres per day.

That's why a **NEW IDEA** is a good ideal

NEW IDEA All-Steel Wagon is readily adaptable for use with NEW IDEA Corn Pickers—and for all farm hauling jobs. Capacity conservatively rated at 6,000 pounds.

Brand **NEW** No. 175 Elevator moves most anything in 17½" wide, 26 to over 50 ft. long trunk with closed return trough. Short or long truck. Numerous drives available, for powering from engine, motor or p. t. o. Easy-to-adjust, suspension type truss rods. Chains ride on replaceable wood strips. Built to last a lifetime.

No waiting or paying for outside help to get your corn in the crib. No sharing of your corn profits with neighbors or custom-pickers. Not when you own a NEW IDEA Picker!

You run the whole show from start to finish—a one-man show. Low-reaching gathering chains and floating points that follow field contour get all the corn. Non-crushing snapping rolls search out every ear and snap it smoothly. Fast-action, fully adjustable husking rolls deliver each ear husked cleaner than you thought possible.

All controls on a compact NEW IDEA Picker are easy to reach, easy to operate. All working parts are readily accessible, held rigidly in line. And . . . under all field and crop conditions . . . you can count on quicker, thriftier, non-stop performance by your NEW IDEA "corn hustler". See the outstanding One-Row and Two-Row Pickers, and One-Row Snappers now on display at your nearby NEW IDEA dealer's. Mail coupon for detailed literature.

Bushman Power Wagon Unloader

Simplest -- Most Economical -- Best

- Low price—high quality
- Fits any wagon or truck
- Sweeps box clean
- Operated by one man
- No stake-down required
- Couples in 3 seconds
- Sturdy, simple, foolproof
- Electric or gas motor
- Extra wagon sets available
- Adjusts to any height
- Handles even chopped forage
- Does work of 3 men
- Unloads slow or fast
- Works from either side

From row to silo

**WITHOUT
HAND
LABOR!**

FILL YOUR SILO THIS FALL COMPLETELY BY MACHINE!

1. Let the NEW HOLLAND FORAGE HARVESTER roll swiftly down your corn rows, snap and chop stalks, leaves, ears, and load your wagon—2. Your tractor hustles your wagon to foot of—3. silo, where a NEW HOLLAND FORAGE BLOWER puts it away. That's the easy, fast, economical machine way of making good silage.

"Corn silage has a place in grassland farming practice in a great many areas. This crop is ideal for handling in a modern forage harvester with a row-crop attachment."—from University of Kentucky study.

NO OTHER FORAGE HARVESTER OFFERS YOU ALL OF THESE ADVANTAGES—AT NO EXTRA COST

• You can start, stop or reverse feeding action from tractor. Reverse prevents clogging. Deflection angle on discharge pipe controls from tractor. Discharge pipe easily turns left, right or to rear without changing supports or removing pipe. • Easily adjusted, choice of 11 cutting lengths from $\frac{1}{4}$ " to 4". • Large throat opening, 112 square inches, handles up to 20 tons of corn per hour—or 6 tons of chopped dry hay. • You can change from row crop to windrow pickup, or vice versa, in a few minutes (only 5 bolts to change).

• Continuous upper apron, crawler-type, is exclusive New Holland advantage. Positive, even feed; prevents jamming. • Four-knife flywheel is precision balanced. Slices like a knife cut—not scissor action. Scientific cutting angle uses less power. • Feed table can be started, stopped or reversed from the tractor. • Micrometer-type adjustment bolts permit blade removal for sharpening without disturbing adjustment (exclusive). Hinged steel housing allows easy access to chopping knives.

WINDROW PICK-UP ATTACHMENT

Windrow attachment for grass, semi-cured or dry hay. Special fingers lift hay gently. Capacity 6 tons chopped dry or 8 tons of semi-cured hay per hour.

Model 680
FORAGE
BLOWER

New tilt-table blower has low 22" operating position. Moves up to 30 tons of green chopped hay per hour . . . 40 tons of silage. Wheels retract.

Model 610 Power
Take-Off FORAGE
HARVESTER

New forage harvester operates from tractor with power take-off of 31 h.p. or more. Cost is \$617 less. Illustrated above with row crop attachment mounted.

Washington Tightens Control Over Milk Marketing

SECRETARY of Agriculture Charles Brannan is credited with a new plan to federalize city milk markets now under marketing orders and agreements, including the Metropolitan New York area. In 37 markets which have such marketing agreements, about 1,000 people are employed, 125 of whom work in the Metropolitan New York Area Office. Before the last day of June, 1951 it is expected that all these employees will be required to take a Civil Service examination and that if they fail to pass it they will be out of a job.

The money which milk handlers pay to cover the cost of administering the Order will go to Washington and come back to employees by way of a government check. Heretofore milk administrators and their employees have been on a semi-independent basis with the administrator free to hire and fire in accordance with merit of each worker.

Opposition Aroused

When questioned, the U. S. Department of Agriculture blamed this move on the Civil Service Commission; yet the plan has been characterized in newspapers under such terms as "political control," "federalizing the 37 major milk markets of the nation," and "a plan to make Secretary Brannan a milk czar."

The New York State Farm Bureau Federation passed a resolution stating that the plan would result in a further concentration of power in the Federal Government, lead to greater government domination in the milk industry and end the independent status of milk administrators. It might also make the job of milk administrator less attractive to able men!

Senator Irving Ives is one of those who charged that Brannan is trying to make himself milk czar of the nation.

Spokesmen for the National Milk Producers' Federation discussed the plan with John Thompson, Deputy Chief of the Production Marketing Administration, and were given to understand that it would become effective some time within a year. The Federation has expressed itself as opposed to the plan, but so far has taken no action.

Court Decision Disturbing

A second bit of disturbing news concerns a recent court decision on milk. In Washington, D. C., milk has been marketed under a pooling plan, but without a federal order. Federal Judge Alexander Holtzhoff has ruled that

VICTORY?

Just as we go to press, the New York Times reports that Secretary Brannan will rescind the order putting the New York Milk Market under complete federal control. We hope the report is correct. If so, it will demonstrate the power of united action by dairymen's organizations.

marketing agreements which include a classified payment plan to farmers are illegal unless a Federal order is in effect. The Judge held that such private marketing arrangements without a federal order were "in restraint of trade" and subject to anti-monopoly prosecution. Putting it baldly this means that farmers cannot do an orderly job of marketing milk by themselves but must have federal "help."

If the decision stands (and we are informed that it has not been appealed), the natural result is for producers and dealers in many cities to clamor for federal orders. No conclusion is possible except that this decision, plus the "federalization" of all milk marketing orders, will give Washington a much firmer grip on milk marketing over the entire country.

Dealers' Bonds Raised

Price cutting in New York City, which dairymen have been watching for some months, is reported as being somewhat less prevalent in recent weeks. A pertinent suggestion has been made to the effect that a full-scale war, which is not expected but which might come, would probably result in freezing prices, and that, for their own good, price-cutters had better get back in line before such an event happens. We understand also that the New York State Department of Agriculture and Markets has asked for financial statements from New York City milk handlers by August 10, and that already larger bonds from some handlers have been asked for to insure payment to producers for their milk.

The estimated uniform price to producers for the New York Market for the month of July is \$3.53. For the months ahead, prediction is that the new formula which goes into effect August first will give a price which will please dairymen, considering all the factors involved.

Dick Waterstram, second from left, who graduated from Griffith Institute at Springville, Erie Co., N. Y., 2 years ago as a 4-year student in vocational agriculture. At the left is John Gold who was his teacher of agriculture during the last 2 years. Next to Dick is his father, president of the local Board of Education. The man at the right is "Sonny" Cotton of the Victory Preserving Company of Ontario County, N. Y., who is shown inspecting the Waterstram crop of canning peas and has just decided they should be cut by the next morning. The peas are "Surprise" planted May 4. A year ago, 2 tons of lime were put on this field. This year 500 pounds of 10-10-10 fertilizer were added.

Help Yourself to BIGGER EGG PROFITS

DURING PURINA'S BIG
COST-CUTTING FAIR

ALMOST SAVE HALF

ON THIS FAMOUS PURINA FEEDER

Purina's regular ALL-METAL hanging feeder. Lasts for years. Feeds 25 laying hens. Usually sells for \$2.60, but look at the bargain you can get during your Purina Dealer's Cost-Cutting Fair!

PURINA

for GROWING
and LAYING
BIRDS

REGULAR

\$2.60
PRICE

NOW ONLY

\$1.35

WITH EVERY 500 LBS. OF PURINA LAYING CHOWS

Here's all you do: Just buy any Purina Chow for laying hens. With each 100 lbs., get a coupon. Whenever you have 5 coupons turn them in with only \$1.35 to get the feeder. Buy all you want. No limit.

Hurry. Start saving coupons now—so you can get SEVERAL feeders. Offer lasts only until Oct. 31, and is good in Continental U. S.

SAVE the cost of feeding CULLS

Most Purina Dealers are ready and waiting to come out and help you cull your flock. They'll help you take out hens that have "quit" for the summer. They'll also help you grade out poor pullets before housing. Just ask your Purina Dealer. It's part of his Cost-Cutting service.

ASK YOUR PURINA DEALER
TO CULL YOUR FLOCK

SAVE up to 5¢ feed cost per dozen eggs

On the average U. S. farm it takes at least 8 to 6½ pounds of feed to produce a dozen eggs. Good farmers on the Purina Plan are doing it on 5 to 5½ pounds. This means a saving of at least 5¢ worth of feed. Feed makes a big difference in the way your hens lay. Get Purina during your dealer's Cost-Cutting Fair. See for yourself.

LAYING CHOWS

Trends and Goals

I've been reading a lot about TRENDS. Market trends. Business trends. And political trends.

What is a TREND?

The dictionary says a trend is a direction or course. That means, without question, that at the end there is a GOAL.

What is our Goal? Our farm goal? Our business goal? Our family goal? Our personal Goal? From the TRENDS we follow today, shouldn't we in some measure figure out our Tomorrow's Goal, both in business and in our personal lives?

In Proverbs 22:6 we read: "Train up a child in the way he should go, and when he is old, he will not depart from it." Good training is a sure Trend toward a worthy Goal.

In our business, from the very beginning, we have tried to select men whose Trends point the way to high Goals in the future. They have qualities of Grit, Daring, Energy, and Character. They are men of Vision and Determination with Growth Goals of Service.

Each one of us has a big personal stake in the future. Our Trends of today finally reach an ultimate Goal in the future. The important thing for each of us is our daily living... maintaining standards which are high. We don't want to pretend to be something we are not. We need to have courage to meet every problem. We must come to grips with temptations and measure up to our duties. We must stop humoring our little peevish selves and learn to get along with people. In every phase of life we must develop a kind of strength that will stand up at all times.

Our Trends must be in the right direction to accomplish a Worthy Goal.

Daringly,

WM. H. DANFORTH
Chairman of the Board
RALSTON PURINA COMPANY
St. Louis, Missouri

KOROK DOORS

Swing open the 2-foot square door on a Korok Silo — you'll agree it was built for your convenience. Safe, handy Steplock draws door tight, yet lifts easily to release lock.

THE ACID TEST

... shows Korok tile stave silos best. They're acid-proof — not just acid-resistant. Rust and rot proof. Triple-sealed insulation gives real protection against frost. Longest life, minimum upkeep — that's real economy.

Peach and Apple Growers Expect Better Prices

By L. B. Skeffington

APPLE growers are more optimistic that markets will be better for them this year than a year ago. They point to early-season estimates of a national commercial crop of 110 million bushels, compared to 133 last year. The National Apple Institute's unofficial figures indicate four million bushels fewer apples in the New York commercial crop. For the Northeast, it estimates there will be five million bushels less in the commercial crop.

Peach growers find themselves statistically in a favorable position, with both state and national crops substantially below last year. The State Peach Growers Association, headed by Don Nesbit of Albion, has begun earlier to line up a campaign to acquaint the retail trade and the consuming public with peach prospects.

Cherry Price

As the sour cherry harvest started on a crop estimated to be at least 50 per cent more than last year, growers and packers were sparring a bit over price. Pre-harvest found growers taking eight to 10 cents a pound and processors offering six. Then the government announced that it would buy cherries from processors on the basis of seven cents a pound to growers. Most of the growers with whom I talked expected to pay two cents a pound for picking, and I also heard that some crew leaders were demanding 2½ cents.

Duncan Award Revived

For some years before the war the H. S. Duncan Memorial Fund, named for the man who organized the state's produce inspection service, made annual awards to growers and marketers to recognize good marketing practices with fruits and vegetables. The fund committee has voted this year to offer an award of \$200 for an exhibit in the Horticultural Building at the State Fair which (a) shows best promotion of New York State fruits or vegetables, and (b) has the most sales appeal for the products to consumers.

Can Learn from Europe

Warren Hawley of Batavia, State Farm Bureau president, back from a trip to Europe, says American farmers can learn some things from European farmers, especially in soil conservation. He said that in Italy he walked through fields that had been producing for 1,500 years and maintained good yield because of conservation practices.

In England he found government farm planning so well organized that the individual farmer is nothing but a cog in a great machine and has no freedom of action. He said European farmers are well organized, but production policies are entirely dominated by government. In the Scandinavian countries a large part of farm produce is handled through cooperatives, but Hawley feels they are approaching the point where co-operation and initiative may be lost.

Good Growing Weather

Since late June, frequent rains through Western New York have speeded growth of all crops. This same condition applies in most sections of the state, tapering off to dry conditions in the North Country.

By mid-July in Western New York, most corn lots had developed beyond the cultivation stage. Wheat had turned brown, and here and there it looked ready for harvest. Many farmers say

that with continued hot weather, they expect to start combining a few days earlier than usual. Wheat generally looks like a good crop, with an occasional stand knocked over by wind or rain.

Oats, which started to head on short straws, have done a remarkable job of growing since the rains came. Pastures, which by the third week in June were showing the effects of wind and near-drouth, now are green and growing rapidly. Especially on improved pastures which have been fertilized, the comeback is luxuriant. The rains and humid weather helped practically all crops, including fruits and vegetables, but made it extremely difficult to harvest hay. The latter crop appears to be heavy in most sections.

A.A. SPONSORS NEW WEATHER FORECAST FOR AREA FARMERS

"Think it will rain?"

"Think it will freeze?"

"I wonder if tomorrow and the next day will be good drying days?"

The weather is just about the most important consideration in Northeast farming during the summer and harvest months, and that's why your farm paper is now sponsoring a detailed report on the weather over the facilities of Rural Radio Network's 13 FM stations.

At 12:15 p.m. each weekday, details about weather, including temperature, rainfall, humidity, wind and pressure are given from six stations across New York from West to East, and then from the U. S. weather bureau at Albany comes a report on what the weather will be for the next 48 hours in each section. *American Agriculturist* is proud to sponsor this program because it has been called the best weather report in the nation. It will keep you informed on what the weather will be at your farm. You can tune it in on your FM radio from any of the 13 New York and Pennsylvania stations listed on page 11 of this issue.

A special little booklet on the weather, explaining some of the terms used by the announcers and outlining the things that determine the weather, is available free. Send your request for a copy to Jim Hall, *American Agriculturist*, Ithaca, New York.

GRANGE LEADERSHIP CONFERENCE

From July 2 to 8 the New York State Grange held an excellent Youth Leadership School at the New York State Agricultural and Technical Institute at Delhi. The school, which was attended by 80 young people from nearly every county in the State, grew out of a Grange delegation which attended a training conference for Young Cooperators at Cazenovia a year ago.

The staff of instructors included Ivan Borden who is studying for his Master's Degree in Rural Sociology at Cornell; Gertrude Corfman, Assistant Supervisor of the Young Cooperative Service of the Dairymen's League; Harry Graham of the New York State Grange; James and Ruth Norris of New York City; Florence Pickett, lecturer of the New York State Grange, and Bernice Scott of the Cornell Extension Department.

The conference was so successful that it is certain to be continued and perhaps enlarged another year.

Mrs. Elizabeth Adamek of Endicott, N. Y., who will represent Tioga County in the bread contest finals at State Grange this fall. Mrs. Adamek is a member of Campville Grange.

GRANGE BREAD CONTEST NEWS

SINCE our last report on the progress of the big statewide breadbaking contest sponsored by New York State Grange and *American Agriculturist*, eight more Grange women have won their county contests and thereby put themselves in line for the final test at State Grange this fall. Valuable prizes, including cash, groceries, and six pieces of household equipment, await State winners at the end of the road. Recent county winners are:

COUNTY	GRANGE	WINNER
Broome	Nanticoke Valley	Mrs. Mary Ingraham
Cattaraugus	West Valley	Mrs. Lela Arhens
Chenango	Coventry	Mrs. Margaret Fletcher
Fulton	Crum Creek	Mrs. Emmett Mosher
Jefferson	Star	Mrs. Claude Weaver
Putnam	Glenida	Mrs. Mary Tompkins
Sullivan	Fosterdale	Mrs. Clara Filippini
Tompkins	McClean	Mrs. Nita Smith

STATE FAIR TO HAVE "LITTLE THEATRE"

WHEN you go to the New York State Fair this year, don't fail to visit the "Little Theatre" in the Harriet May Mills Building on the Fairgrounds. Popular one-act stage plays will be presented Monday through Friday of Fair week at 6:30 p.m., and also on the opening day, September 2, at an earlier hour. The actors will be selected from among 45 Community Theatre organizations throughout the state.

The "Little Theatre" is a revival, after 28 years, of the State Fair "Country Theatre," founded and directed by Professor A. M. Drummond of Cornell University, and the biggest attraction on the Fairgrounds in those days. For several years its plays delighted and thrilled State Fair visitors, and then unfortunately the project had to be abandoned because of lack of facilities. Mr. Drummond is serving as advisor for the 1950 theatre.

Tickets for admission will be free. You can get them in advance through your farm organizations, local community theatre groups, and the Rural Radio Network, or write to *American Agriculturist*, Box 367-F, Ithaca, N. Y.

American Agriculturist is especially glad to see this revival of a State Fair theatre because for several years we have been keenly interested in encouraging rural dramatic groups, even to the extent of holding play-writing contests and making original one-act plays available to such groups. All of our plays are comedies, royalty-free, and cost 35 cents a copy. For a list of them, send 3-cent stamp to *American Agriculturist* Play Dept. at the above address.

Food stores

that sell MORE

... anything in it

for farm families?

SAFEWAY HAS BEEN BUSY improving its food stores — rebuilding and remodeling for even more convenient self-service food shopping.

The newer Safeways are better lighted, more spacious, and equipped to the last minute. Customers tell us they're a pleasure to walk into. And we know for a fact that *more people* are walking into them...

With our rebuilding and remodeling, each Safeway store today averages over four and a half times the sales in dollars that a Safeway store averaged 10 years ago.

This expansion in sales per store (and per employee also) results in money-savings.

Enough money is saved to more than offset the enormous increases that have taken place in labor and rebuilding costs (increases farmers know plenty about, too!).

While the dollar volume of our sales is naturally larger now than 10 years ago, due in part to increased food prices, this fact stands out: *These modernized stores of ours can operate for fewer pennies out*

of each food dollar spent in them than could our older Safeways.

**Safeway now distributes
for smaller part of food dollar
than 10 years ago**

For all our retailing services on all farm crops, Safeway requires less than 14¢ out of the food dollar. This 14¢ is an average — some farm products require less than 14¢ per dollar of sales to handle, others more.

Such Safeway costs as wages, rents, taxes, displaying foods attractively and advertising them — plus Safeway's profit — are all covered by our 14¢ total requirement per food sales dollar.

How much is Safeway's profit? It amounted in 1949 to 1½¢ per dollar of sales at our stores.

Fourteen cents out of each dollar of sales is a considerably smaller cost than average for the jobs we do.

It is also a smaller part of the food dollar than Safeway required to perform its services 10 years ago. And one main reason is that — year by year — we've learned to operate more efficiently.

. . .

The Safeway idea of selling more food per store and per employee isn't ours alone. We are in free competition with many stores working toward the same end.

It seems to us that is good for everybody—for farmer, customer and store man alike. We invite you to test our ideas of how a store should be run by doing your food shopping at Safeway, where almost one-fifth of all customers are farm families.

**SAFEWAY
STORES**

DIESEL'S THE POWER SHEPPARD'S THE DIESEL

It's an Everlasting Fight To Get Clean Apples

(Continued from Page 1)

to ration them. This does not work; you cannot ration sulphur when the rain is falling. Credit agencies, of course, are justified in advising caution, but a halfway job of spraying for scab will not pay back losses.

When the infection began to show up, about June 14 and 15, those who had kept careful spray records were able to begin to analyze where they had made their mistakes. In our own case, I have concluded that the best way to prevent scab infection is not to have any the year before. This cuts down so much on the danger that ordinary control methods seem to get by. Where there is a seeding of scab the year before in your orchard, extraordinary efforts still only give fair results.

A great deal of lime sulphur has been used this spring. We have not used as much of this material as in 1949, partly because we were spraying when it was muggy or rainy. Under these conditions our experience has been that the lime sulphur did as much damage as the scab, and still left enough scab for secondary infection. Other growers who were able to time their spraying for sunshiny days with good drying have used lime sulphur to good advantage in burning out scab infection.

Scab Still Active

On the whole, many of the best commercial orchards in western New York have some scab scattered around. Its effect on their crop yield, I think, will not be too important. Some of the under-manned, under-equipped or poorly-financed operators who were not quite as interested have more scab than they should for profitable apple production. In some of these orchards, up to 30% of the apples are now infected with scab and, I believe, have plenty of leaves for later secondary infection. Hot, dry weather, is usual from now on and may keep down further spread. Most growers will be justified in keeping sulphur or some other fungicide on their fruit to keep down further infection. Fermate has proved to be a good summer fungicide, particularly in keeping fruit clean. Fermate is not as dramatic a preventer of leaf scab, but it seems to work on fruit.

The sulphurs are usually dangerous in summer, especially the fine ones, when it gets very hot. Some fruit scalding and leaf damage can be observed. However, some apple growers will have to take this chance.

Tough Worms

Growers who were not in there early with DDT are finding that a good carry-over of codling moth from last year is giving plenty of stings. I have been able to find plenty of entrances into poorly sprayed apples. Arsenate of lead, as usual, is not holding our breed of codling moth in western New York. Some growers in the Hudson Valley report that they have had to shift back

to DDT from lead arsenate. Last year I found that in a hot spot for codling moth in one of our blocks, a combination of 1 pound of parathion and 2 pounds of DDT per 100 gallons of water really cleaned things up in a hurry.

So far, red mite is not too important, but their day is ahead. Workers in Massachusetts tell us that there is a new yellow mite which may be bothersome through the entire season. Mites are bad if they get going, but we are going to try to keep ahead of them this year, although the spotty way they start in an orchard makes it difficult to handle them. We hope the oils will hold them down in the blocks where we used it.

One observation we made this year was that lubricating oil put on at delayed dormant time did considerable stunting of Cortlands. Leaf buds did not come out until flower buds had opened, and trees looked miserable compared to neighboring blocks which had not been oiled. McIntosh trees in this block were not affected at all. The trees have since recovered, but the crop appears to be a little lighter here. Plum curculio has done more damage than last year. New England has had serious increase in this pest. Parathion has helped at the rate of 2 pounds per 150 gallons.

Testing New Ways

While a great deal of information was given out at the winter meetings about concentrate sprays, most of the growers were pretty careful after the research workers' admonition to "take it easy" with these new methods in New York State until we have had a really bad year to test out the new spray plans. This year should have been heavy enough on scab so we will have some real data comparing misters and spray dusters and concentrate vs. un-concentrated.

Personally, we did not dare take a chance with any change with our low ratio of machinery to acreage and are just now beginning to get around to double our concentration and reduce the dosage. We visited two orchards in Massachusetts on a national tour where double concentration had given excellent results this year. The biggest difficulty I personally have had with concentrate spraying is to be able to concentrate myself enough to make sure we are doing as good a job as we should. You have to check pretty carefully to make sure spray is going in. The speed and experience of the spray rig operator is very important. Clogging has been a problem, particularly when "NuGreen" was added with lime. Because we have sprayed so much in the rain we have had to double sulfur per 100 gallons, but took no time to reduce the volume. The pioneers who make these new ideas work well have the laugh on some of us stick-in-the-muds who are afraid to get out of the old rut.

GARDEN IRRIGATION

Mr. Lawrence Leach irrigates his garden with a home-constructed water pumping system consisting of a common pitcher pump connected to an old automobile transmission by a wooden eccentric arm. The transmission is powered by a small electric motor. The garden is assured of sufficient quantities of water during even the driest periods. The transmission is set in reverse for best operation.

New Jersey F.F.A. Members Hold 21st Annual Convention

NEWTON Chapter, Future Farmers of America, set a record at the 21st annual convention of the New Jersey F.F.A. that probably never will be equalled. Newton boys made a clean sweep of the 3 speaking contests at the convention, won 4 F.F.A. Foundation awards, and got 5 of the 17 Garden State Farmer awards.

More than 100, including 40 delegates, attended the three-day convention at the State School of Conservation at Stokes Forest in Sussex County and elected the following officers for 1950-51: Joseph Blakeslee, Newton, president; William Chafey, Mt. Holly, vice-president; Karl H. Reinhardt, Rahway, secretary; Alvin Kuske, Millville, treasurer; Tom O'Brien, Englishtown, reporter; and Owen E. Kiser, College of Agriculture, New Brunswick, advisor. Members of executive committee are: George Aaronson, Columbus, Charles Hoffman, Belvidere, and James Hart, New Brunswick.

William Chafey of the Rancocas Valley Regional High School at Mt. Holly, became the fifth boy to win a coveted Star Garden State Farmer certificate and the \$100 that goes with it from the F.F.A. Foundation. Sixteen of the 1,321 F.F.A. members in New Jersey were presented Garden State Farmer certificates and State Farmer charms.

In a contest based on farm mechanics activities, both in school and at home, Richard Mooney of Andover, Newton Chapter, won the F.F.A. Foundation \$100 first award. Second prize of \$75, contributed by Sears, Roebuck Foundation, went to Harold Dunn, Monroe, also of Newton Chapter. Another Newton boy, Carmen Howell, tied for third place with Karl Reinhardt, Rahway, Pioneer Chapter. They each got \$37.50 from the Sears Foundation.

Prize winners in the farm and home electrification contest were: William Heater, Branchville, Newton Chapter, \$100 F.F.A. Foundation; George Wright, Newton Chapter, \$75 from New Jersey Farm Electrification Council; and Joseph A. Blakeslee, Newton, \$50 from the same Council. Blakeslee also won the \$100 F.F.A. Foundation award for his soil and water management project. In the chapter farm safety contest sponsored by the F.F.A. Foundation, Newton won first place and \$100; Belvidere Chapter, second, \$65; and Millville Chapter, third, \$35.

The *American Agriculturist* gold medal for outstanding leadership among New Jersey F.F.A. members was presented to Thomas O'Brien of Englishtown who is a member of the

Thomas O'Brien of R. D. 2, Englishtown, N. J., who was elected a state officer at the Garden State F.F.A. Convention, also won the gold medal awarded by *American Agriculturist* for outstanding leadership. He is one of 12 youths in the Northeast who will get one of these medals this year.

Jamesburg High School F.F.A. Chapter. O'Brien was selected from nominations made by vocational-agriculture instructors by O. E. Kiser, state supervisor of agricultural education, and a committee of state officials. Tom's list of activities from the time he entered high school until graduation last June filled two typewritten pages.

Delegates to the convention conferred honorary state farmer degrees on C. B. Davenport, vo-ag instructor at Mt. Holly for 28 years; Louis Gombosi, vo-ag instructor at Newton; and James B. Woodford of Riverton, farm youth director for the Campbell Soup Company.

Winners of the state finals in the 3, 5 and 10-minute speaking contests were: Roy Aher, Joseph Bell and Richard Wright, all of Newton.

— A.A. —

DDT FOR CORN BORERS

At the New Hampshire Experiment Station some tests have shown that the use of DDT will reduce corn borer infestation by at least 40%. Control in some plots was better than 90%.

DDT was used as a 3% or 5% dust or as a spray. There should be no copper in the spray or dust as this injures the plants.

The corn was first treated when the tassels began to appear, and the insecticide was applied so that as much as possible of it would fall in the whorl of the top leaves. The second application was made a week later. The following week a third application was used to cover the entire plant, and a week later an application was directed primarily on the developing ears.

The control of corn borers is of particular interest to sweet corn growers.

— A.A. —

INOCULATING LEGUMES PAYS IN CASH

"Inoculate your legume seeds. It's worth dollars to you," says Lester Smith, agronomist for the Vermont Extension Service.

One good acre stand of clover or alfalfa will take \$15 to \$25 worth of nitrogen out of the air and turn it into protein during a year.

Be sure to inoculate your clover and alfalfa seed with the correct inoculant to help the legume start up its nitrogen factory in the small wart-like growths on the roots soon after the seeds sprout, the agronomist warns. It is best to use fresh inoculant on all legume seeds.

"That still isn't the one I mean. Now guess once again."

Growing wheat?

Increase your yield and lower your costs with

Blenn!

This year especially, the bigger the yield you get from every acre at low cost, the more money you'll make from your wheat crop.

Just as a combine is designed to save labor and money at harvest time, BLENN is designed to help produce bigger wheat crops at lower cost. So this year especially, you should use BLENN—Swift's specialized crop maker—along with good seed.

Here's the reason: BLENN is especially made to supplement the plant food nutrients in your particular soil. Together, your soil's natural nutrients plus BLENN supply all of the many plant food elements your wheat crop needs for finest growth and biggest high-quality yields at lowest cost.

Using BLENN pays off!

BLENN is a low-cost investment that pays big dividends in far higher yields from every acre you plant. BLENN more than pays for itself—it brings in extra cash besides.

BLENN is 4 ways more uniform

BLENN grows more bushels per acre because it is a *specialized* plant food that is so uniformly blended that every plant gets a perfectly balanced ration of needed growth-making elements. Swift's *exclusive* manufacturing process makes BLENN more uniform in four important ways: (1) uniform blending, mixing, curing; (2) uniform freedom from caking, lumping, bridging; (3) uniform distribution through your machines; (4) uniform feeding of your crop.

BLENN feeds your crop from the very beginning right through to harvest. It produces a uniform wheat crop with long heads, well filled with high-grading grain.

This year, increase your yield per acre at low cost with BLENN. See your Authorized Swift Agent today and order this crop-boosting, income-boosting plant food early.

Swift's New Process

"Goodbye Mr. Woodchuck"

Readers Give Valuable Tips on Control

Editor's Note: In our July 15 issue I called for help in controlling woodchucks. There are more and more of them every year, and they do untold damage. As a result of the editorial, we have received a large number of interesting and worthwhile suggestions. Space will not permit printing all of the letters, but here is a summary of the remedies suggested. Let's make a business of cleaning up this pest!

Dynamite

I believe our farm has had more woodchucks per acre than any other farm in the state. If you have one hole where we have ten, you have a lot.

For the last two seasons we have used dynamite with excellent results. We usually use a one-half pound stick of 40% dynamite with about three feet of fuse attached. We then place it down in the hole which is plugged.

This is the first time we have felt that we were diminishing the woodchuck population. A permit to buy dynamite can be secured from the Town Clerk for 25 cents.

—F. A. Salisbury, Phelps, N. Y.

Poison

If you want to get rid of woodchucks, mix one part of paris green with ten parts of salt and put the mixture in the hole. Lead arsenate will do instead of paris green. By using a long-handled spoon, or something similar, you can get the dope far enough down the hole so that stock cannot get it. I have tried almost everything and this mixture beats them all. — Martin J. Keough, Aurora-on-Cayuga, N. Y.

Gasoline

Take an ordinary burlap bag and cut it into four pieces. Soak each piece in gasoline and poke one piece into every den while the gasoline is still dripping from the piece of burlap. Poke it in as far as possible and then seal the entrance. This kills the chuck inside, and no outsiders use the hole again because of the odor which remains for quite awhile.

I treated two fields that way last year, and so far this year there have been no woodchucks on them.

One bit of warning: Don't doctor every hole on your place, because once you clear out the woodchuck population it's kind of lonesome without them. No targets to shoot at, no work for the dog, and no opportunity for exercising one's vocal chords with a few good cuss words. — Albert T. Kardas, Valley Falls, N. Y.

A Real Woodchuck Dog

In a recent issue you asked your readers for an effective way to control woodchucks. When I bought the farm it was so badly infested with woodchucks that it was really dangerous to walk in the meadows where there were so many holes. Finally I got a Shepherd pup and when he was a year old I went with him to locate the holes. The first year he killed 5 woodchucks. Then every year he increased his find until one year he brought 100 to the door.

Two years ago, at the age of 17, he started to lose his hearing and eyesight so I got another Shepherd pup. Together they located the holes and the new dog, like the old one, makes his rounds every day. So far, he has killed 2 this year. I never had anything destroyed by them. We never allowed the dogs off the farm to hunt.

This year the old dog died at the age of nearly 20 years, and the young one is carrying on his good work. So far, he is true to his job along with being a good cow dog, so I can truthfully

say a good Shepherd dog is worth his weight in gold.—Stoddard Porter, Ellenville, New York.

Fire

You ask for advice on getting rid of woodchucks. This is easy. All you need is a pointed shovel, a quantity of old rags, preferably wool (an old sock is fine), a can of gasoline and some matches.

First, plug all entrances to the hole except one; next, have a shovelfull of dirt or sod handy; saturate the rag with the gasoline; push it well into the hole; light your match and throw it in the hole. There will be a flash, so be sure to keep out of range. Plug the hole thoroughly and forget it. The slowly burning rags will hold the gas and smoke for some time. I never have known this to fail. I never have had any luck with bombs. Try it, but be careful! — H. S. Fullagar, Penn Yan, New York.

— A.A. —

CAMP MINIWANCA WINNER FOR 1950

The winner of the *American Agriculturist* Scholarship to the leadership training school at Camp Miniwanca, Shelby, Michigan, is Joseph Mitchell of Hockessin, Delaware. He will be at camp from August 14 to 27.

Joseph has been a 4-H Club member for 11 years. He has been State dairy showmanship champion; a member of the State winning 4-H dairy production demonstration team, and he is now at-

JOSEPH MITCHELL

tending the University of Delaware on a scholarship which he won as a 4-H Club member. He has also won many other honors.

We who pick the winner of the scholarship are always interested in any evidence of willingness to pass along the benefits of boys' and girls' organizations. In this connection, Joseph Mitchell helped to organize a new 4-H Club in a neighboring community two years ago. This year he is starting to sponsor an annual achievement award to some first-year 4-H Club member in Newcastle County, Delaware.

In awarding these scholarships annually, it is the hope of the editors of *American Agriculturist* that the two weeks spent at Camp Miniwanca by winners will increase their appreciation and understanding of leadership, and that they will make use of what they learn to make better communities wherever they may locate.

The Question Box

Does birdsfoot trefoil imported from Italy mature at the same time as birdsfoot grown in this country?

In general European birdsfoot, which mostly comes from Italy, becomes established faster and will reach bloom stage about 10 days earlier than Empire birdsfoot which is one of our established varieties. The Italian birdsfoot also seems to produce an aftermath a little more readily.

Is there any way of estimating the loss in grain when it is combined?

If you will take a square foot of ground and hunt for kernels of grain on it you can get a close check. If you find from 16 to 18 kernels of grain in a square foot, you are losing around 2 bushels of grain per acre.

What can be done when a person discovers himself in a patch of poison ivy?

Where it can be done soon, one of the best treatments is a thorough scrubbing with soap, and many people seem to think that yellow laundry soap is most effective. Some report that soaking in warm water with baking soda or epsom salts helps relieve the discomfort. If you get a bad case so that blisters are formed, you had better see a doctor.

What causes pea pods to be wrinkled and warped? This condition appeared on quite a few of our peas this year but we never noticed it before.

This condition is caused by the disease known as pea mosaic. Not too much as yet is known about effective control. The peas in the wrinkled pods are all right to eat but the disease does cut down production considerably.

Our beets always seem to be thicker than I expected from the amount of seed I sow. This makes considerable thinning necessary.

Each beet seed as you buy it in the package is really a fruit which contains 2 to 6 seeds. However, the result in thinning isn't all loss because the young beets make as good greens as anything you can grow.

Is it possible to grow a crop of garden peas in the fall?

It has been done, but the chances of failure are so high that it is not very practical. Usually we do not have good growing weather sufficiently early so that peas will mature in quantity.

How is rhubarb forced during the winter-time?

Dig up roots before the ground freezes in the fall. Leave them outside until they are frozen. Then after a dormant period of about 4 weeks of freezing weather they can be brought into the cellar and the roots covered with dirt to prevent drying out. If the temperature of the cellar is around 60 degrees F. you may harvest some stalks in 4 weeks. The cooler the cellar the

longer it will take for the rhubarb to grow to eatable size. You may be able to harvest stalks from 4 to 5 weeks, at which time the roots are exhausted and should be thrown away.

Are portable irrigation pipes practical when they are moved by tractor?

They work very well. First they were recommended for hay and pasture. Then pipe was put on wheels that allowed the pipe to clear cultivated crops such as potatoes or vegetables when it was moved.

Is a cellar likely to be drier if it is kept tight during the summertime or if windows are taken out so air can circulate?

We suggest that the windows be left in. The reason for this is that air in the cellar is always cooler than it is outside. Warm air can hold more moisture than cool air; therefore, if you leave the windows out, the warm air containing moisture gains access to the cellar and the moisture condenses and collects on the floors and walls. Keeping the windows closed is particularly important if you use a drier containing calcium chloride, as some people do. This calcium chloride picks up three times its own weight in water and therefore tends to keep the cellar dry.

It's Handy

HANDY GARDEN WEEDER

Here is a sketch of a handy garden weeder that I have used for many years to hoe up close to the plants in the row. Take a board an inch thick and eight

MOWER SECTION

inches long, leave a head three inches wide or the width of a mower section, whittle it down to a nice round handle, and fasten a mower section to the head as shown with two screws. You now have a weeder that is very convenient. —I.W.D.

Blocking a Tractor

To block a tractor for belt work, slip some heavy boards under the rear tires with the other end resting on the front tires. This keeps the front end from bouncing. —E. Look, Hamlet, Indiana.

While this type gate permits persons to go through, it is impossible for animals to go through. Hence, it is a most valuable possession on any farm.—Mrs. R. D. Richardson, Spencer, Mass.

Personal To Women With Nagging Backache

As we get older, stress and strain, over-
exertion, excessive smoking or exposure to
cold sometimes slows down kidney func-
tion. This may lead many folks to com-
plain of nagging backache, loss of pep and
energy, headaches and dizziness. Getting
up nights or frequent passages may result
from minor bladder irritations due to cold,
dampness or dietary indiscretions.

If your discomforts are due to these
causes, don't wait, try Doan's Pills, a mild
diuretic. Used successfully by millions for
over 50 years. While these symptoms may
often otherwise occur, it's amazing how
many times Doan's give happy relief—
help the 15 miles of kidney tubes and filters
out waste. Get Doan's Pills today!

Ideas from a Maine Broiler Turkey Farm

A Photo Story By Harry A. Packard

Larry Marston of Hebron, Maine's largest raiser of "broiler size" turkeys, is pictured holding up one of his 3,000 U.S.D.A. Beltsville Whites. Ten pound dressed birds are this Oxford County farm's specialty, but 20,000 day-old poulters were sold this season. Larry's dogs, shown in the Jeep, keep protective eyes on the birds. The big German sheep dog sleeps right with the birds in one of the three 1,000-bird flocks.

Here is one of the three huge outdoor roosts at Marston's 'Turkeyland' Farm. These roosts, intended to protect the birds from depredations of foxes and other enemies, are fast becoming obsolete and Marston probably will not use them in the future. Turkeymen have found that a series of kerosene road-flares solves the wild animal problem. The flickering, wavering light keeps foxes away.

Turkey raiser Marston keeps his birds in tested spring water which is in almost unlimited supply. In sections of the range where gravity may be used, the water goes into drinking fountains with automatic valves. For other sections a 50-gallon barrel is mounted on a pair of wheels, rigged with automatic control of flow, and then hauled around the range wherever the birds congregate.

More than 30 feet in the air, this tower room with four glass sides affords Marston a complete view of every section of his 200-acre turkey farm. He is shown here up on the 'balcony' with his dogs. Larry is enthusiastic about the Beltsville White broilers bred down to a small-bone structure, and says they command a premium price on any market. "Turkey in the Straw" might have been written about Marston's farm because part of their diet while on range consists of oats that he seeds on part of his acreage to give them additional green feed. When the oats are about ready to mature, portable feed hoppers are moved into the oat field.

The outstanding garden of Walter Townsend, Walton, N. Y.

A FORUM FOR Backyard Gardeners

IT ISN'T often that a garden impresses a passer-by to the extent that he turns back for a chance to see it and to talk with the gardener. This happened to me recently a few miles north of Walton, Delaware County, New York.

The gardener was Walter Townsend who works 40 hours a week in a Walton shop and spends a good share of his spare time in his garden. We agreed perfectly that gardening is more fun than golfing, just as good exercise, and far more profitable.

Walter is an experimenter. This year for the first time he has put nail kegs over his tomato vines, believing that they will serve as a substitute for stakes in holding the tomatoes off the ground. He has his peas growing on a wire fence. He agrees that it would be pretty expensive to buy fence just for peas, but he has some which he uses year after year. It is much easier to pick the peas. He has even tied up raspberry canes which, as he says, bear so heavily that they tip over or break off.

It seemed to me that no family could eat all the produce from this garden. The Townsends have two youngsters at home now, and four boys away from home, three of them having served in the second World War. Mr. Townsend tells me that he sells strawberries and raspberries to his fellow-workers at the shop, but that his family consumes the bulk of the vegetables, much of them going into cans for winter use.

Every garden enthusiast enjoys callers, and Mr. Townsend is no exception. He told me that the men at the shop ask him about his garden, and he asks them why they don't stop and look at it. In spite of that they go by 60 miles an hour, recognizing him by a toot on the horn as they go.

You will go a long way before you will find a better kept garden than that of Walter Townsend, and if you happen to pass by, I know Walter will be glad to have you stop and look at it.

Good Berry Year

The past two weeks in the backyard garden have brought some interesting experiences, taught some new lessons, and confirmed some old ones. I have never seen a better year for strawberries, although early in the season, due to cool weather, some berries spoiled before they were dead ripe. As a result the last berries put in our freezer were better than the first, so we marked them for use on special occasions.

Every time I try to renew a strawberry bed and keep it a second year, I say "never again." Yet I plan to try again, mainly because we like the new berry "sparkle" and I do not have a

new bed of that variety. First I will clean out nine-tenths or more of the old plants and all the weeds and grass (I hope), and then put on a heavy application of 5-10-5, something I neglected to do in former years.

A lesson relearned is that strawberry plants shouldn't be too thick. Because last summer was dry, runners were so scarce that no thinning was necessary. Yet production was excellent, and therefore I will thin this year even more drastically than usual.

Birds and Cherries

After hearing the laments of my friends, I wonder why the birds left us any cherries. In spite of the fact that we have a bird concert every morning a little before sunrise, we harvested a good crop of sweet cherries from our one tree and picked enough sour cherries for a pie on July 4th. My conclusion, based on a somewhat limited experience, is that birds are not as bad as they have been painted. As Jim Hall says, "What do you think?"

Incidentally, this was the first year our sweet cherry tree has had a crop. Originally I set out two for cross-pollination, but one died. This spring I hung a fruit jar in the tree with some bloom from another tree. I can't prove that this gave us a crop. Anyway, we had sweet cherries.

Both sweet and 'sour cherries were practically free of worms. I dusted them faithfully with good results.

Roses

We recently followed the directions of a friend in starting some new climbing roses from a bush we particularly treasure. We cut several blossoms, including a piece of the stem from which it grew, planted them and covered them with quart fruit jars. Instructions say "do not disturb until next spring." If you try this with tea roses and have success, the bushes may not stand a severe winter. The roses you buy are grafted on hardy roots.

More Lawn

Following my decision to grow more grass and less garden, a good-sized piece of former garden is now waiting to be seeded in late August. Meanwhile I go over it occasionally with the garden tractor and cultivator to keep down the weeds.

There is no fertility problem with this area, so I plan to have it graded by mid-August, use good seed and let nature take its course. An adjacent area seeded in the fall of '48 is now an excellent lawn, in fact, one of the smoothest we have. If it were necessary to push a hand mower, my enthusiasm for grass would be dampened. Our garden tractor is designed to handle a rotary lawnmower which is attached in front.

Late blight is most costly when the crop's full-grown. Then it can steal a whole season's work. But DITHANE protects your crop—from start to finish—and pays off in bonus bushels.

A powerful preventive fungicide, DITHANE sprays and dusts can also stop blight—even after it's developed. It's this two-way protection that makes a DITHANE program especially valuable from now until harvest time.

DITHANE controls many diseases of many crops. It is also a safe fungicide for foliage, blossoms and fruit of tomatoes, cantaloupes, cucumbers and other copper sensitive crops. The result: crops sprayed or dusted with DITHANE consistently outyield crops treated with other fungicides.

See your dealer for dependable DITHANE dusts and sprays.

DITHANE is a trade-mark, Reg. U. S. Pat. Off. and in principal foreign countries.

10 North Cherry St., Poughkeepsie, N. Y.

"I can't afford to have my horse laid up"

says Norwood Andrews of Moorestown, N. J.

"Whenever I see any signs of lameness on my horses, I use Absorbine for relief. I'm sure it saved me many working hours in the past 10 years."

There's nothing like Absorbine for lameness due to strains, puffs, bruises. It's not a "cure-all," but a time-proved help in relieving fresh bog spavin, windgall and similar congestive troubles.

A stand-by for over 50 years, it's used by many leading veterinarians. Will not blister or remove hair. Only \$2.50 at all druggists.

W. F. Young, Inc., Springfield, Mass.

SIXTH EASTERN REGIONAL JERSEY SALE

University of New Hampshire—Durham, N. H., Saturday, August 26, 1950

THE SALE OF THE YEAR IN THE EAST

SELLING SIXTY HEAD OF TOPS IN BOTH TYPE AND PRODUCTION

DID YOU KNOW THAT

A Jersey is National Lifetime Champion over all breeds with 10,226 lbs. fat—184,883 lbs. milk.

A Jersey is the only cow to produce over 1,000 lbs. butterfat in two successive lactations in twice daily milking.

Only a Jersey has produced as much as 1,128 lbs. fat on twice daily milking.

Only a Jersey herd of over 100 cows has averaged 616 lbs. fat—11,703 lbs. milk per cow.

JERSEYS ARE MONEY MAKERS—HERE'S YOUR CHANCE TO OWN SOME

AN ATTRACTIVE CATALOG ON REQUEST To Laurence Gardiner, Sales Manager
Dr. R. E. Fiske, Chm., Sales Committee, Manchester, N. H. 1863 Cowden Ave., Memphis 4, Tenn.

By J. F. "Doc" ROBERTS

WHAT TO do now? That's the livestock question no one can answer! Probably most of us will simply go along about as usual, deploring the situation we are in here and abroad, but living it out so that food—or the lack of it—will not add to this confusion.

Livestock prices have not advanced much more than they would have with present receipts without the war scare, in spite of what our "commentators" are telling us. I do not anticipate shortages, hoarding, blackmarkets, etc. Remember, it took five years to develop all those things in the last war, even with government help. That is still vivid to us!

Our meat processors have had a tough time making ends meet (no pun intended) so far this year. Livestock prices quite generally have been higher than the general public would pay for their products. The little retailers have also had it tough with lower consumption and greater competition. This is the direct opposite of a year ago or less. But this squeeze has got to be taken up and probably will be by government contracts. This, as usual, will probably raise meat prices ahead of livestock prices all through the present trouble.

When we start with live steers up to 33c, cows around 20c, hogs at 25c, lambs at 29c, calves at 30c, feeding lambs being contracted in the West at 23c, and feeding calves up to 30c, it could be months or years before world conditions will affect prices very greatly back on the farm. In the meantime, farm costs of operation can be steadily increasing. Already our farm labor situation is tightening in New York.

For a long time many of us have been saying that prices are too high. I was brought up rather short the other day when asked, "Just what constitutes 'too high' from your experiences of the last few years?" Nevertheless I still believe that prices are too high, even though I expect they will be with us for a long time to come.

Livestock receipts on the markets of the Northeast have been unusually light for this time of year. This could mean either that there has been a tendency to hold livestock on the farm or that there is a shortage. I doubt the shortage theory and therefore feel that it is unwise to carry livestock that is ready or headed for market anyway. This, for two reasons: First, it is always good business to market any livestock when it is ready; second, holding back could result in an over-supply for a few weeks this fall, creating sharply lower prices from which it would take too long for farm products to recover.

Today the President used the words "food profiteering." We must be getting ready for controls. If you follow government food purchases, which always disrupt food markets, you will be in a far better position to judge future food prices, as well as livestock prices. In conclusion: A "tight old crab"

died in a New England town, but no one paid any particular attention to his passing. Finally, an old man from across the river came and, after viewing the body for a long time, said, "Yes sir, he was a good one for keeping his barn doors closed." That is all the good I can see in our present world situation.

Preserve the Season's Best

A FRIEND remarked the other day, "Now I do my shopping down cellar mostly," meaning from her freezer and cellar shelves. It gives a wonderfully satisfied feeling to know that you need never be caught short or unprepared by unexpected happenings, bad weather, guests or whatever.

The filling of the freezer and the cellar shelves need not wear you out, either. But, like most operations, organizing the job ahead of time makes it go much more smoothly. Large kettles and baskets for scalding or chilling; pressure canner or water-bath kettle; the right kinds of containers, jars, cartons, and the tools for handling hot foods and jars might well be checked over to see if all are ready. This avoids delays which might cause a poorer product.

One thing is certain—you won't get a better fruit or vegetable out of the jar or carton than you put in. Since most foods deteriorate rapidly during warm weather, getting them prepared and processed as quickly as possible after picking is really important.

I can think of a few exceptions to this rule where it really pays to hold the food for just the right stage for canning. Ordinarily, nothing takes the place of sun-ripened fruits and tomatoes; yet picking them when fully ripened makes bruising or crushing more likely. Pears, if allowed to remain on the tree too long, develop hard lumps—I don't know why.

Hence for ripening tomatoes, peaches and pears, I use the wire-mesh-bottomed flats, set up on bricks for ventilation, and spread the fruits one layer thick on them. I can then select the fruits at just the right stage for processing. I get my reward when I serve them and a friend asks, "Now how did you make them taste so much like fresh peaches?"

FOR CANNING

1. Scald in water just to cover; pack hot (except tomatoes).
2. Add ½ teaspoon salt to each pint of vegetable, 1 teaspoon to a quart.
3. Cover vegetable with hot cooking liquid; allow proper headspace for each type being canned.
4. Wipe tops of jars and rubber rings with clean, damp cloth. Adjust covers according to manufacturer's instructions.
5. Keep water in bath 1 inch over tops of jars at all times.
6. Carefully time the processing periods; reduce pressure to zero in pressure canner before opening.
7. Stand jars 1 inch apart to cool; avoid drafts.
8. Store in cool, dark place.

Canning Sirup

Thin: 2 cups sugar to 4 cups water
Medium: 2 cups sugar to 3 cups water
Heavy: 2 cups sugar to 2 cups water

APPLES: Peel, quarter or slice thin. Boil 1 minute; pack; cover with boiling thin sirup. Fill jars to ½ inch of top. Process pints 15 minutes; quarts 15 minutes in boiling water bath.

APPLESAUCE: Wash, quarter, core. Add a little water. Cook till soft. Sieve or put through food mill. Sweeten if desired. Pack hot. Fill jars to ¼ inch of top. Process pints 10 minutes; quarts 10 minutes in boiling water bath.

GRAPE JUICE: Wash; stem; crush. Heat to simmering. Strain through

By **GRACE WATKINS HUCKETT**

cloth bag. Add ½ to 1 cup sugar per gallon of juice. Fill jars (hot) to top. Process pints 20 minutes; quarts 20 minutes in boiling water bath.

LIMAS: Shell; wash; cover beans with boiling water. Bring to boil. Add ½ teaspoon salt per pint of beans. Pack hot. Fill jars to 1 inch of top. Process pints 35 minutes; quarts 60 minutes at 10 pounds pressure.

PEACHES: Scald about 1 minute; cold dip, peel, halve. Cover with boiling medium sirup to ½ inch of top. Process pints 25 minutes, quarts 30 minutes in boiling water bath; OR simmer 5 minutes in hot sirup and pack hot to ½ inch of top, process pints or quarts 15 minutes in boiling water bath.

PEARS: Peel; halve; core. Boil in medium sirup 1 minute. Pack hot; cover with boiling sirup. Fill jars to ½ inch of top. Process pints 20 minutes; quarts 20 minutes in boiling water bath.

SWEET CORN: Shuck; silk. Cut from cob to get most of kernel. To each quart of corn add 1 pint of boiling water. Bring to boil. Pack hot. Fill jars to 1 inch of top. Cover with hot liquid. Process pints 55 minutes; quarts 85 minutes at 10 pounds pressure.

TOMATOES: Scald enough to make skins slip; peel. Pack whole or cut up. Press down on tomatoes until juice fills the jar. Add 1 teaspoon salt per quart. Fill jars to ¼ inch of top. Process pints 35 minutes; quarts 45 minutes in boiling water bath.

TOMATO JUICE: Wash, cut out stem, remove any spoiled or green parts. Quarter; heat to boiling. Put through sieve or food mill; add 1 teaspoon salt and 1 tablespoon sugar (if desired) per quart. Bring to boil, fill sterilized bottles or jars to overflowing. Seal. Cool quickly. No processing necessary.

FOR FREEZING

1. Scald and chill vegetable in large quantity of water.
2. Leave room in containers for expansion. Press air out of liners for quicker freezing and less discoloration.
3. Keep surface of liner clean and dry when sealing. Use medium heat for sealing iron. Freeze immediately after packaging, spreading packages only one layer deep.
4. Store at temperature no higher than 0 degrees F.
5. Ascorbic acid (Vitamin C) prevents discoloration in peaches, pears, plums, and apricots. Dissolve ¼ teaspoon of the powder in each 4 cups of sirup. Ascorbic-citric acid mixtures under various trade names are much cheaper than straight ascorbic acid and are quite satisfactory. (Get from freezer supply houses. Instructions on bottle.)

Freezing Sirup

30%: 2 cups sugar to 4 cups water.
40%: 3 cups sugar to 4 cups water.
50%: 4 cups sugar to 4 cups water.
60%: 6 cups sugar to 4 cups water.
65%: 6¾ cups sugar to 4 cups water.

APPLES: Peel; core; cut in ½ inch slices; steam 1½ minutes; cool in air; pack dry; no sugar or sirup.

APPLESAUCE: Prepare according to favorite recipe. Cool. Package in heavily paraffined containers; freeze. Serve as dessert while still slightly frozen.

BROCCOLI, BRUSSELS SPROUTS, CAULIFLOWER: Inspect all carefully for insects or worms. (Hold broccoli ½

hour in salt solution—¾ cup salt to 1 gallon water—to remove worms.) Wash carefully. Divide heads into pieces convenient for freezing; remove woody parts. Scald small pieces 3 minutes; larger, 4 to 5 minutes. Cool promptly; drain; package; freeze. Broccoli may be packed in cellophane and covered with stockinette or, like sprouts and cauliflower, in cartons with liners.

GRAPE JUICE: Freeze extracted, sweetened, cooled juice in liquid-tight containers.

LIMAS: Shell; wash; sort according to size. Use only medium-sized well-color-

in cartons without adding anything. Use in salads while still a little frozen.

TOMATO JUICE: Use well-ripened tomatoes; wash; remove stems and green spots; cut into sixths. Simmer 5 minutes. Strain. Add 1 teaspoon salt per pint of juice. Cool rapidly. Fill liquid-proof container 9/10 full. Glass jars may be used. Freeze.

PEACH AND APPLE JELLY

6 cups peach juice
1½ cups tart apple juice
5 cups sugar

Wash peaches, remove stones, cut fruit in pieces. Add water to come ½ inch deep in pan; cook until peaches are very soft. Strain through jelly bag.

Grape Conserve gives a lift to Sunday night supper and is a treat at any time. Try the tested recipe on the opposite page.

ed ones. Scald in boiling water 2½ minutes; cool promptly. Pack; freeze.

PEACHES: Immerse sun-ripened peaches in boiling water just long enough to loosen skins—or peel without scalding; dip into cold water; drain. Peel one peach at a time directly into 60 to 65% sirup (cold), in heavily paraffined cartons. Fill to ¾ inch of top. Cover pieces completely; close package at once.

PEARS: Peel; core; quarter. Cover immediately with 40 to 50% sirup.

SWEET CORN: Whole kernel; husk, silk, wash. Sort; scald according to thickness of ears; 1½ inches thick at large end, 6 minutes; 2 inches thick at large end, 8 minutes; larger ones, 10 minutes. Cool in very cold water until corn is temperature of water; cut kernels from cob; pack; freeze.

TOMATOES: Not satisfactory for whole tomatoes. Slices may be frozen

Wash and quarter apples without paring or removing cores. Add just enough water to prevent burning; cook slowly until apples are soft. Strain through jelly bag.

Combine the 2 juices and sugar, stir until sugar is dissolved; boil rapidly to the "sheeting off" stage: 2 drops run together and the mass sheets off the side of a metal spoon when poured from it. Makes about five 6 oz. glasses.

GRAPE JELLY

5 cups juice
6½ cups sugar
1 box powdered fruit pectin

Stem about 3½ pounds fully ripe grapes and crush thoroughly. (Concord grapes give best color and flavor.) Add 1½ cups water; bring to a boil and simmer, covered, 10 minutes. Place in jelly cloth or bag and squeeze out juice. Measure 5 cups juice into a large saucepan. Measure sugar and set aside.

TODAY IN Aunt Janet's Garden

I Weed and Dust!

HAVING just finished an after-supper bout with weeds in the border, I feel rather philosophical about gardening as I try to forget my aching back.

First I had to run the sprinkler before I could persuade the weeds to let go. I followed my usual practice of operating the sprinkler for an hour in one location—then waiting for at least an hour before working around the plants. Aside from the disagreeable part of getting wet myself, there is more danger of transferring disease from a wet plant than from a dry one. That is why we see so much more black spot, mildew and similar plant troubles in damp, foggy weather.

I rely strongly on bordeaux mixture to control these diseases. Since it is made up in different proportions, I depend upon the advice of the specialist at one of the local fertilizer companies. I tell him what plants I want to dust, and he tells me what strength to get. So far, the scheme has worked, except that the bordeaux does not help the aphid situation.

Since DDT has been used so much on neighboring farms, I have had plant lice where I never had them before; DDT does not control them. So I get a

commercial dust which contains nicotine in addition to chemicals for controlling the common plant diseases. The local hardware store and many of the flower catalogs list such dusts. I particularly like one which is tinted green; it is less noticeable on the plant foliage. Then the phlox, roses, peonies, chrysanthemums and even the viburnums (which do not tolerate sulphur) can get through the season with reasonably clean foliage. Once every ten days or two weeks is suggested, but I feel lucky if mine get it two or three times during the season.

One plant which seems disease-and-insect-free is the hardy pink. Every June I have a mass of fragrant blossoms, and all I have to do is to keep that section of the border free from grass and weeds and in fair fertility. I shear off the old bloom when it is finished and have the remaining gray-green foliage to contrast with the darker green of the border. These plants are from cuttings made from twelve-year-old plants which had to be dug up when the border was renewed 2 years ago. I grew the original plants from seed.

Besides the fragrant pinks I have had the thrill of seeing the real rock garden dianthus bloom profusely. During the spring of 1949 I planted the seed which originally came from an English friend's garden. The plant grows about six to eight inches high; the flowers are a bright rose pink, less

than an inch in diameter, a real miniature and a treasure for the rock ledge. These, too, seem as free from troubles as the larger, fragrant pinks.

PRACTICAL NURSING COURSE STARTS SEPT. 5

BECAUSE of the shortage of nurses, the Ithaca, N. Y., School of Practical Nursing was started a little over a year ago. Since then three classes have entered, and another is forming for Sept. 5. It takes only one year to complete the course, and those who take it can be assured of an interesting and satisfying career.

Applicants must be over 18 years of age, must have completed the 8th grade, and must pass a physical examination and arrange for a personal interview.

If you are interested in becoming a practical nurse, write at once to Mrs. Ruth H. Thomas, Director, Ithaca School of Practical Nursing, 117 E. Buffalo St., Ithaca, New York.

— A.A. —

EASY SEAL FOR JAMS AND JELLIES

JELLY-MAKERS can now throw away their paraffin and buy cellophane jam-and-jelly seals in convenient packages like Christmas seals and labels. It's a new quick-and-easy method for sealing jams and jellies called "Jiffy Seals." You just dip them in water, press them down over rim of jar or glass, snap on a rubber band, and you have a perfect, airtight seal. The seals come in packages of 25, complete with rubber bands, gummed labels, and circles of wax paper which are laid on the hot jelly before applying the seal.

These cellophane seals are also handy for covering left-overs in the refrigerator, for hermetically sealing baby bottles and baby foods, for laying on cut halves of oranges and grapefruit, for preventing crusting of cup custards and puddings, and for sealing fruit juices, custards, and foods in glass jars in lunch boxes. The seals are inexpensive and can be found in most stores.

PRESERVE THE SEASON'S BEST

(Continued from Opposite Page)

Place saucepan holding juice over high heat. Add powdered fruit pectin and stir until mixture comes to a hard boil. At once stir in sugar. Bring to a full rolling boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, pour quickly into glasses. Paraffin at once. Makes about eleven 6-ounce glasses.

GRAPE CONSERVE

- 4 cups prepared fruit
- 1 tablespoon grated lemon rind
- ¼ cup lemon juice
- 7 cups sugar
- ½ pound seeded raisins
- 1 cup finely chopped nutmeats
- ½ bottle fruit pectin

Slip skins from about 3 pounds fully ripe grapes. Bring pulp to a boil and simmer covered for 5 minutes. Sieve to remove seeds. Chop or grind skins and add to pulp. Measure 4 cups into a large saucepan. (If wild grapes, Malagas, or other tight-skinned grapes are used, stem, crush, and simmer with ½ cup water 30 minutes. Sieve and measure.) Grate the rind from 2 medium-sized lemons. Measure 1 tablespoon into saucepan with grapes. Squeeze the juice from 2 lemons and add ¼ cup to fruit.

Add sugar, raisins and nutmeats to fruit in saucepan and mix well. Place over high heat, bring to full rolling boil, boil hard 1 minute, stirring constantly. Remove from heat and at once stir in bottled fruit pectin. Then stir and skim by turns for 5 minutes to cool slightly and to prevent floating fruit. Ladle quickly into glasses. Paraffin at once.

Trim and Flattering

No. 2197. You always need a new apron. This one has fresh appeal in its flower-pot pocket! Sizes small, medium, large, extra large. Medium, 2¾ yards 35-inch. Applique included in pattern.

No. 2200. This smart coat-dress style has an easy pleat which begins where hip-length buttoning ends. Sizes 12-20, 36-42. Size 18, 4½ yards 39-inch.

No. 2224. The perfect washable — trim, comfortable, easy to make! The brief ruffled sleeves are youthful and the panel treatment is slenderizing. Sizes 12-20, 36-46. Size 18, 3¾ yards 35-inch.

No. 2228. Two versions of a basque-direndl—both with crisp touches of white. Sizes 6 months, 1, 2, 3. Size 2, 1¾ yards 35-inch; ½ yard 35-inch contrast for sleeves and yoke. Or, with contrasting collar, yoke and sleeve bands, 1½ yards 35-inch; ¾ yard 35-inch contrast.

THE YOUTH'S COMPANION

Attaching Tarliberry

By MANLEY PIKE

SYNOPSIS

Henry Manson, junior clerk for Pettigrew, Pitts, Pepper & Co., wholesale grocers, is assigned the important task of attaching the assets of a debtor. To do this he took the train to Damascus Centre. While on the train he saw representatives of another creditor obviously on the same mission as he, and began to lay plans to outwit them. But as he got off the train he saw these men getting into a dilapidated carryall which was the only carriage in sight.

PART II

"Go on! Go on!" cried Browning.

"Don't stop!" screamed Cutter.

"I'll jes' hol' up a minute and see wut he wants," answered the driver, coolly. "If I kin git 'nuther pass'njer, why, I'm a-goin' t' take him."

"Never mind. Here's five dollars apiece for these two empty seats inside here. Now, remember, they're ours," exclaimed Browning. "No room here, young man," continued he, laughing, as Henry ran up. "We've a fancy for seclusion and extra seats."

Henry was very angry. "Of all the mean, contemptible tricks—" he broke out.

"Don't get excited, my lad!" sneered Cutter, lighting a cigar. "Haven't you ever learned that all's fair in war and the grocery trade?"

Henry had already turned away from them, resolved to act instead of talking. Showing a five-dollar bill to the driver, he said:

"If this is the price of seats in this thing, I don't object. There's room in front with you, isn't there?"

"In course!" answered the man, beaming with joy and seizing the money. "Up with ye, sonny!"

"Here!" roared Browning and Cutter, both together. "None of that! We've bought—"

"Ye've bought four seats, but ther's a fift' one fur sale, an' it's sold," interrupted the driver, grimacing at Henry. "Naow ye've got what ye paid fur, and so's he! Git up, Jake!"

He swung his whip, and the horse moved off with its inharmonious load.

The driver, whose name proved to be Elmer Cummings, was in a not unnatural state of exhilaration over a trip which was putting more money into his pocket than he would have earned in a fortnight under ordinary circumstances.

"Sakes alive!" he kept saying. "Wasn't it luck that I happened to be doawn t' the deepott this partic'lar day? Ye see, I don' make no reg'lar business o' kerrying folks t' th' Mills—only, when work's light, I jes' hitch up an' come for th' sake o' th' aoutin', an' pick up anythin' thet offers. 'N I guess I know what you three's after."

Henry made no reply.

"Tarliberry, ain't it?" said Cummings.

Henry nodded absently. To tell the truth, he was much more intent on overhearing certain whispers passing between the two men inside than on listening to Cummings's idle ramblings. He did not believe that his troubles were over yet.

"Thet's it, is it? Tachment, likely? Be ye a constable or depperty sheriff?"

Henry shook his head. The pair behind appeared to be forming some plan, to judge from the very earnest tones

of their repressed voices.

"Ain't, eh?" continued Cummings, slyly. "Then ye expect to find one at th' Mills?"

"Why, yes. Isn't there one there?"

"Oh yes, there's one, only—"

At this moment Henry caught one or two words of the talk going on within—enough to understand what the enemy were plotting.

"Very well," he said to himself. "If that's their idea, why, I must beat them at their own game."

The making of this decision prevented him from noticing the queer expression upon Elmer Cummings's hard features, which would otherwise have led him to draw that astute person out a little.

"Do you own this carryall?" asked Henry, hastily.

"Sartin."

"What will you take for it?"

Cummings looked surprised at first, then meditative, then cunning.

"Wal, I hain't never thought o' tradin'," he began.

"Quick! Will you take fifty dollars?"

"Wal—"

"Yes or no?"

"Yes, I s'pose," admitted Cummings, "sence ye press me so hard. But p'raps them others—"

"Sold, isn't it?" snapped Henry, as abruptly as Mr. Pepper himself.

"Yes, sold!" sighed Cummings, with the sadness and hesitation of a man losing heavily by the transaction, instead of getting four times what the crazy old trap was worth.

He was pocketing the proceeds of the

sale, when Browning threw aside the curtains, saying:

"Want to sell your horse and wagon, driver?"

"They're sold!" interposed Henry, jubilantly. "They belong to me now."

"What! Belong to you?"

"Yes, sir, I've just bought them. And, excuse me, sir, but I rather prefer riding alone."

Browning was beginning a series of violent remarks, when Cutter broke in.

"I say, driver, did he buy the horse, too?"

Henry was aghast. Before he could speak, Cummings replied, "No, nothin' but the kerridge."

"We'll buy your horse then! How much will you take for him?"

"What'll ye give?" asked Cummings, grinning with pleasure at this promised accession of more wealth.

"Seventy-five dollars! Do you take it? Sold!" sputtered Cutter.

The driver had ducked his head; more from astonishment than anything else.

"I'll give a hundred!" exclaimed Henry, alarmed.

"Too late! Browning's a witness to the sale. You're held to your word, driver," retorted the brusque Cutter, who saw that Cummings would like nothing better than to make the two parties bid against each other.

But Cummings had plainly, if unwittingly, nodded to Cutter's inquiry, and could not draw back from his bargain.

"Now, young man," remarked Browning, while he and his companion un-

harnessed the horse from the shafts. "we'll leave you in undisturbed possession of your carryall—and much good may it do you!"

With this the victorious couple mounted double on their unwilling steed and trotted off.

Henry, sitting in stupid despair upon the front seat of his horseless, useless vehicle, was desolate as Marius among the ruins of Carthage, but, unluckily, not solitary like Marius, for Elmer Cummings was still there, and with really magnificent impudence, offered to buy back the carryall for seven dollars and fifty cents!

"Ye see," giggled he, "taint wuth so much to me as 'twas to you, an' besides, I've got to hire a hoss to get it hum wuth."

Convinced that he was in the company of one of the greatest rascals he had ever met, Henry had a strong desire to tell Cummings exactly what he thought of him, but soon saw that he must not offend a man who might still be of some assistance. So, with a violent gulp, he swallowed his feelings, and asked:

"How far is it to Mosher's Mills?"

"Bout three miles—yes, strong three."

"How am I to get there?"

"Don' know."

"Can't you—" But he broke off what he intended to say, for he saw a man in a light wagon driving up in the direction he wished to go.

"Hullo!" he cried, running to the wagon. "Will you take me to the Mills? I'll pay you well for it."

"Guess so," replied the man, a substantial-looking person of a far more intelligent, respectable appearance than Cummings. "Won't take any pay, though. Jump up! I'm going straight there."

Henry mounted the wagon, bursting with joy. He turned to fling a denunciation or two at his late driver, but was arrested by the singular expression of combined bewilderment, surprise and amusement upon that estimable person's honest face.

"Good-by, young sir!" Cummings called out. "I'll tell ye naow what I was a-goin' to tell ye a spell back. Ther' aint but one cunstable to Mosher's Mills!"

Off drove the wagon. Henry was considerably puzzled at the parting speech of Cummings, which seemed to contain some important meaning.

One constable was amply sufficient for his purpose, and he felt sure that the fine horse which drew him would reach the Mills long before the overweighted beast ridden by Browning and Cutter.

Indeed, the pair were overtaken within a few minutes. Henry, being only a boy, could not resist the temptation of taunting them.

"Good-by, gentlemen!" he exclaimed, bowing politely as he passed. "I'm sorry I can't wait for you; I have business ahead!"

Browning and Cutter did not answer. They stared with amazed eyes, not at Henry, but at the man with him.

Henry turned to examine his new acquaintance, in order to discover what there might be in his aspect to produce such a remarkable effect upon all who saw him. He found the man already keenly examining him.

"Who are you, anyway?" asked the

(Continued on Opposite Page)

SLIM AND SPUD

Pincher Brings Home Something, Anyway

(Continued from Opposite Page)

man. "What's up?"

Henry told his errand, described his adventures, and ended by inquiring:

"Can you tell me who the constable is?"

The man smiled rather oddly.

"Well, I'm the constable."

"You?" shouted Henry, delighted. "Then you will please take me to Tarliberry's and serve this attachment."

"Can't do it."

"Can't? Why not?"

"Nothing—only—well, I'm Tarliberry myself!"

The whole journey had been a succession of disagreeable happenings for Henry, but this was the worst of all. He merely stared, unable to speak.

"Yes," continued Tarliberry, "I'm Jonas Tarliberry, storekeeper — also constable. So, you see, I can't very well put an attachment on my own goods, now can I?"

Henry still said nothing. Even beyond his disappointment and vexation, he felt truly sorry for this kindly, good-natured man, whom he was endeavoring to deprive of his property, although to secure the payment of a just debt. He finally managed to stammer something to this effect:

"Bless you," said Tarliberry, serenely, "I don't blame you a bit! I've been unfortunate, and can't pay my bills, so your firm's perfectly right to protect itself; and as for you, why, you're a good boy, and only doing your duty. To be honest, I'd rather your house should have the first chance."

"Then would you—"

Henry stopped short. The proposal he had in mind was too imprudent for utterance. He didn't believe that even Elmer Cummings could have made it.

"Why, yes," answered Tarliberry, still serenely and without changing countenance. "Somebody's going to attach, whether or no, and I'd as lief it should be you as those other fellows—in fact, I'd a little rather, for I've taken a fancy to you, and I never admired either of them overmuch."

He calmly turned the horse around and began driving back.

"What. Are you really—" cried Henry, "really going to—"

"Yes, really going to hunt up another constable," answered the good Tarliberry.

The constable was obtained and driven to Mosher's Mills, where Browning and Cutter were rushing about, trying to devise some means of procuring assistance. They distrusted their senses when they saw Tarliberry escort Henry and the constable into his own store, and there receive service of the little strip of paper which had cost our young friend so much tribulation.

They could do nothing but go home, completely defeated, too angry to speak.

Henry parted with genuine sorrow from his generous debtor, whom, before he went, he had cause to employ in his other capacity of an officer of the law, for he chanced to see Elmer Cummings sneaking along with that identical carryall sold at such an exorbitant price.

Mr. Cummings was instantly arrested on a charge of theft, and so terrified that he gladly compromised by paying back the purchase-money, less the seven dollars and fifty cents which he had offered for the old machine.

"I was too mighty smart that time," muttered the humbled Cummings, "but I was gettin' rich so fast I jes' lost my head, like a good many other folks."

Mr. Pepper said little to Henry, good or bad, on receiving his report, but Henry became the firm's collector the very next day, to the great disgust of bookkeeper Brierley.

Nor did Tarliberry suffer for his magnanimity, for Henry's account of it touched even business-like Mr. Pepper, and the country merchant was treated so leniently that he soon got upon his feet again.

THE END.

COOPERATION

For a Brighter Farm Future . . .

**STEP
No.1**
**Education Instead of Regimentation
Sound Prices Instead of Socialistic Schemes**

Opinion in this country is divided today as never before. Conservative land-owners on the farm, and radical wage-earners in the city are BOTH being confused by socialistic theories blowing in from abroad. Confused, too, by the reckless propaganda of planners, promisers, labor agitators and political schemers here at home.

But we dairy farmers have always known that you can't get sound progress and lasting prosperity for NOTHING. We of all people should close our ears to the siren song of "wealth without work . . . security without sacrifice."

Let's Think This Thing Through

We farmers are substantial people . . . with a sound interest in the land . . . and valuable rights to protect. Why should we burden ourselves and our children with crushing taxes? Why should we forfeit our freedom to manage our farms and affairs? Must we do it for the doubtful privilege of selling our life-sustaining foods below cost of production?

No, what we really need is a campaign of education to convince consumers that it is far, far better to pay fair prices for food at the grocery store, than to pay part of the cost there and the rest in indirect taxes. Taxes that will be unreasonably high, too, due to government bureaucracy and muddle-headed socialism.

We Can Stand On Our Own Feet

We are business men, not beggars. We don't have to bargain away our rights in order to live. We have *real value* to sell. And we should get full cost of production and a fair return for our trouble. The way to get it is the only way that has ever really worked for us . . . the way of cooperation . . . of education . . . and of justly regulated markets offering full value and fair prices to all.

DAIRYMEN'S LEAGUE
Cooperative
ASSOCIATION, INC.

Kernels, Screenings and Chaff

H. E. Babcock, author of "Kernels, Screenings & Chaff," died of a heart ailment in a New York City hospital on July 12 after a short illness. He suffered his first heart attack during the winter of 1947 and, after recovering partially from it, reduced his activities somewhat, but Ed always saw so much that needed to be done to help make this a better world that he often drove himself beyond his strength and available energy.

Born on a farm at Gilbertsville, New York, on February 23, 1889, Ed Babcock devoted his entire life to education, agriculture and public service. He was graduated from Syracuse University in 1911 and, after a brief experience teaching school, he became one of the first county agents in New York State, first in Cattaraugus County and later in Tompkins County.

Deeply interested all of his life in farmers' marketing problems, Ed was appointed Professor of Marketing in the New York State College of Agriculture in 1920. Two years later he resigned to become General Manager of the G.L.F. All readers of this page know how Ed pioneered farmers' co-operatives, how he brought together the Grange, Farm Bureau Federation and the Dairymen's League in joint support of the Cooperative Grange League Federation Exchange — the G.L.F. He was General Manager of the G.L.F. from 1922 to 1936. Under his leadership it grew to be the largest and probably the most successful farmers' buying cooperative in the world.

FOR his great work and contribution to his fellow man, Ed received many honors. Syracuse University, his Alma Mater, gave him an honorary doctor's degree in 1941. He also held an honorary, doctorate of agriculture from Michigan State College, and the University of Wisconsin cited him for "eminent services to agriculture." The American Farm Bureau Federation, which he helped to found, gave him a gold medal and a citation in 1946 "for distinguished and meritorious service in the interest of organized agriculture." He was also cited for outstanding service to agriculture by the American Agricultural Editors' Association.

Always interested in education as a means of increasing opportunities for young people, Ed served on the Cornell Board of Trustees for many years, and for several years as Chairman of the Board. In recent years he was an active director in the Massey Harris Company and in the American Aviation Corporation.

We have by no means mentioned anywhere near all of the important positions of leadership and responsibility that H. E. Babcock held. In fact, there were too many for his own energy. But of all of his marvelous achievements we are sure there were none greater than the help he gave to thousands of people through his page in *American Agriculturist* under the heading, "KERNELS, SCREENINGS & CHAFF." And with all of his many activities there was nothing else that he loved to do so well as to visit with you on this page. After his illness in

1947 he wrote here:

"In my reduced schedule of activities, there is nothing I miss quite so much as writing 'Kernels, Screenings & Chaff.' I don't even except riding my horse back into the young and dry stock pastures to note how the stock is doing and to find the newborn calves. . . . It is fun to feel that I am again in contact with all you fine folks who have read 'Kernels, Screenings & Chaff' and who have written me so many wonderful and friendly letters."

HE started this page with us in 1932, almost exactly 18 years ago, but he had written frequently for us for many years before that. In the foreword of his first page in the June 25, 1932 issue, Ed said:

"In taking on this job I have no particular cause to serve nor world to conquer. I simply want to keep in touch in a friendly and somewhat intimate way with my thousands of friends and acquaintances in the New York milk shed. If by any chance I can bring to your attention a fact, a thought, or a suggestion that will be worth while, I shall feel fully repaid for my effort. On the other hand, I hope you will feel free to write to me your ideas and suggestions."

Well, there have been practically no new farm practices in the changing times of the last 18 years that Ed has not discussed on this page, and in many of these great changes and improvements he led the way, first by trying them out on his farm at Sunnyside in the Inlet Valley, near Ithaca, N. Y., and then by telling frankly and honestly what the results were—good, bad and indifferent. Time and again he was careful to say that what he was doing on his farm and discussing here were experiments, and he warned his readers to try them at their own risk. Whenever his results weren't good, he was frank to say so.

As an example of how he worked, just a few days before Ed's last illness he was talking with us on the telephone about dumping green grass into his trench silo without chopping it. In our July 1 issue he showed a picture of how this was done, and then added: "If it turns out that the stuff is no good, we will faithfully report the fact."

MORE than any other man, Ed was responsible, mainly through this page, for pioneering the rapidly increasing use of grass silage on thousands of northeastern and other American farms. He was the most enthusiastic advocate of improved pastures we have known, and discussed his own experiences with better pastures on his very first page of "Kernels." No one was a better judge of dairy cattle than Ed Babcock and, as you know, he constantly talked about them in our own farm language. He studied to make things easier for dairymen and for all other farmers. An example of this is his idea—first described on this page and now used by many farmers—of a milking parlor where the cow is milked on a platform so that the dairyman does not have to break his back getting down on his knees to attach the machine.

Ed made the Ithaca community a

HOWARD EDWARD BABCOCK
1889-1950

"guinea pig" for experimenting with farm freezers. Largely because of his enthusiasm and leadership, there were at one time more freezers around this section than in any other community of similar size, and now farm freezers are improving the diet in thousands of farm homes.

Ed Babcock was never satisfied with the grasses which farmers had grown for generations, and he constantly experimented with all of the different legumes and grasses. He reported the results of his experiments here, and many of those newer grasses and legumes are found on northeastern farms now.

Yes, Ed's pioneer experiments reported on this page are almost countless, but his most important work, particularly in recent years, was the interest he built, not only among his readers but among thousands of people across the entire nation, in the need for better diet. For years he pointed out that our livestock is fed a better balanced ration than we are. He was convinced that many of life's achievements and our happiness depend upon what we eat and, as you know, he insisted that the basis of a good diet is animal agriculture. You have seen pictures of his "Unimal" on this page many times, the animal representing all of the farm stock which produce the meat, the milk and the eggs that should be the basic foods in everyone's diet.

IN recent years Ed traveled up and down the United States talking animal agriculture to dozens of audiences and to thousands of people, and particularly to leaders who could help him to get people to eat better! He knew that a better diet, based on animal agriculture, would not only help farmers but would be of even more benefit to consumers.

No longer ago than June 5, Ed served as chairman of an animal agriculture

meeting in the Stevens Hotel in Chicago. As a result of that meeting an organization was set up, with Dean Harry Reed of Purdue University as Chairman and Dr. K. D. Butler as Secretary-Treasurer, to organize a large national meeting of leaders for animal agriculture and better nutrition to be held at Purdue about October 1. Following this, smaller regional meetings will be held. Thus the work that Ed started on diet and animal agriculture will go on and on, bringing untold benefits to both producers and consumers.

WELL, Ed has moved on, but the work which he began here will go on in education, in farm organization and co-operation and, of course, especially in *American Agriculturist*. Ed was interested in the newer and better ways of approaching farm work and problems. He was interested in increasing the comfort and happiness of the farm home. That is his challenge to us, as editors of this publication, and that challenge we shall meet.

For a time at least John Babcock will carry on at Sunnyside in the Inlet Valley. With his occasional help, and with that of Jim Hall—who also lives in the Inlet Valley—and others, we shall continue to report on the work that Ed started with the young couples in the Inlet Valley (Jack and Jean Conner, Ross and Marcella Yapple, and Boots and Margaret Poelvoorde) in whose welfare he was so deeply interested.

More than this, we of *American Agriculturist* will be more alert than ever to bring to you the problems of the farm and the home and the newer ways that you yourselves have found to solve these problems on the farms of the hills and valleys of this great Northeast farm country. Inspired by the leadership of one of the greatest men of our time, we pledge ourselves to help you meet the ever-changing problems of these changing times.

THE DELAVAL SEPARATOR COMPANY plans to move the entire DE LAVAL executive staff and general office from New York City to Poughkeepsie, New York. Construction has been started on a new modern office building.

A new moldboard plow, designed to reduce substantially the cost of plowing, was recently announced by DEARBORN MOTORS of Detroit, the National Marketing Organization for Ford Tractors and Dearborn Farm Equipment.

"Razor Blade" shares used on these plows are so low in cost that they are used and discarded, as they cost new about the same as the cost of resharpening conventional shares.

The Lederle Laboratories Division of the **AMERICAN CYANAMID COMPANY** has announced an entirely new drug for blackhead in turkeys. It is called "enheptin." It can be purchased to mix with turkey feeds, or feed treated with enheptin may be available at local feed stores.

THE STANDARD OIL COMPANY OF NEW JERSEY tells us that a new fungicide, which so far has the name of SR 406, is virtually out of the experimental stage and commercial production is expected to begin next year. This SR 406 has been found to be effective against many fungus diseases of plants, including garden, fruit and flower crops.

A new Hydraulic Farm Loader catalog is now available from the **MASSEY-HARRIS COMPANY**, Racine, Wisconsin. Also available at the same address is a clipper combine catalog. **MASSEY-HARRIS** will be glad to send either or both catalogs to any American Agriculturist reader on request.

Something new in pipe for wells and water systems is the Carlon "E.F." flexible pipe. This has no joints; it is long-lived and can be installed rapidly. It is manufactured by the **CARTER PRODUCTS CORPORATION**, Cleveland, Ohio, and is carried by G.L.F. stores.

If you are interested in Diesel tractors, drop a postcard or the coupon on page 6 of the July 1 issue to **THE SHEPPARD DIESELS**, Hanover, Pa., and ask for their free folder containing free information.

In this column in the June 17 issue the following item appeared: "The W. R. AMES COMPANY, San Francisco 7, California, has developed the Ames Ball Coupler for joining sections of portable overhead surface irrigation pipe. Detailed information about this labor-saver is available from W. R. Ames Company at 150 Hooper Street, San Francisco, Calif., or 3905 E. Broadway, Tampa, Florida."

However, the illustration which accompanied the item was incorrect; therefore, we are reprinting the item with the correct illustration which is shown above.

Service Bureau

By H. L. COSLINE

FANTASTIC!

A fellow from Massachusetts tried to sell me some concrete blocks which he claims contain some "cell of life" or something of that nature. They cost \$20, and you are supposed to put one in 55 gal. of water and soak seeds and water plants with it. He claims you can get 7 heads of cabbage to one plant, 21 ears of corn to one stalk, and 200 tomatoes to one plant. It sounds fishy to me. What do you say?

Neither scientific evidence nor common sense would back up claims of this nature. Apparently "Grandpap" fell for some of these schemes because he had too little connection with the world at large. On the other hand, we of the present generation continue to be gullible, perhaps because we continually hear of the miracles of science, some of which are so astounding that our minds are put in a receptive mood for ridiculous claims such as our subscriber questions.

— A. A. —

GUARANTEED?

On July 2, three young men stopped at my place. They wanted to paint my barn roof with a new plastic paint. I agreed and gave them \$40 for the job. I should have saved my money, as the roof leaks as much as ever, even though the work was guaranteed for ten years. These fellows were driving a green '49 Ford ¾-ton truck. A letter to their Elmira, N. Y. address was returned.

Many of our readers have had unfortunate experiences in the past with transient barn and roof painters. We are printing the above letter with the thought it may serve as a warning to our readers to be on the lookout for these three fellows. If they do turn up in your neighborhood, get their license number and notify us immediately, Box 367, Ithaca, N. Y.

To be on the safe side, it is a good idea to have such work done by local contractors. Then if it isn't satisfactory, you stand a much better chance of getting an adjustment.

— A. A. —

AMONG THE MISSING

Last February, Mr. Toni Cataldo, 1662 Cropsey Ave., Brooklyn, N. Y., bought some apples from me and gave me a check. It came back from the bank because of insufficient funds. This was for quite a bit of money, and all my efforts to contact Mr. Cataldo have failed. Is there anything you can do to help me?

We wrote a registered letter to Mr. Cataldo at the Brooklyn address, but it was returned to us by the Post Office marked "Unclaimed." We then contacted the New Jersey State Police and the New Jersey Department of Agriculture. We were told by the Police that a warrant had been issued for this man's arrest and that it would be served when he was located. The Department of Agriculture advised that no produce dealer's license had been issued to Mr. Cataldo.

This case is an excellent example of the advisability of dealing only with licensed produce dealers, as well as demanding cash for produce unless you know the buyer and are sure his check will be good.

If Mr. Cataldo turns up in your neighborhood, try to get his present address and send it to us; and call your nearest State Trooper Barracks so they can notify the New Jersey State Police as to his whereabouts.

— A. A. —

We have a letter from Mrs. John A. Richards dated June 27. No address is given. If Mrs. Richards will please send us her address, we will answer her letter promptly.

— A. A. —

Whether you eat or drink your milk, the healthy way is a quart a day.

THE FARM PAPER OF THE NORTHEAST

An American Farmer Looks at Europe

I HAVE just returned from a seven weeks' trip to Europe. I was amazed at some of the things I saw and shocked at others. The trip made me realize more than ever all the advantages we have in this great country of ours and that the farther we keep government out of our farm organizations, the better off we will be in the long run.

Everywhere I went farmers I talked to had good things to say about America and are well aware and appreciative of our help in getting them back on their feet. From what I saw they have no need for further food from us. For the most part, they are producing most of what they need.

Denmark

As a delegate representing the American Farm Bureau Federation at the meeting of the International Federation of Agricultural Producers, I flew to Stockholm to attend the meeting (from June 20 to 29) at which 26 countries were represented by farmers. Before the meeting I spent four days in Denmark. For the first time I realized how far government could go in setting prices, subsidies and controls; everything a Danish farmer does is regulated.

My greatest shock was in finding that the government of Denmark is taking over many of the large farms and breaking them up into small units to help make more of the population self-supporting. I saw one instance where the government state committee and local appraisers had taken half of one man's 600 acres which they plan to sell to anywhere from 20 to 30 men. On each unit the government will build a house, drill a well, give a man a few cows and a few hogs and, in gen-

eral, set him up in business on a long term repayment plan that is part dole. It is purely a subsistence proposition.

Almost all the cattle in Denmark are Red Danes, and artificial breeding is used extensively, but only the real big farms have fences; most of the cattle are tethered and moved four or five times a day. There are a few old type tractors on Danish farms, but most of the work is done by horses and manpower. On one big farm that had perhaps

By WARREN W. HAWLEY, JR.

President, New York State Farm Bureau Federation

As told to Jim Hall

500 head of cattle they didn't even own a manure spreader, and the manager said: "If I had one, what would I do with all these men that are working?"

The Danes never spread manure unless they can plow it under within four hours "to save its goodness while wet." It is common all through Europe, but Denmark was the first place I saw extensive use of liquid manure. From cesspools in barnyards the liquid is pumped to wagons and sprinkled on the fields. It must do the trick because everywhere I went, except in Finland, they had abundant crops.

Sweden

In the south of Sweden, farming is carried on about the same as in Denmark and like the Danes, the Swedes are thrifty and neat. In the north of Sweden the farms were larger and the countryside reminded me more of the

Warren W. Hawley, Jr., had a lot of work to catch up with on his 490 acres at Batavia, N. Y., when he returned from his 7-week European trip. In picture he and two employees check quality of 55 acres of wheat. From left: Roy Streeter, Hawley, Howard Ettinger.

U. S. It has been said that if you put two Swedes together the first thing they do is to form a cooperative. As in Denmark, dairy products are sold 95% through cooperatives, even in the retail end of the business. Milk which sells for 11c a quart in bottles at stores is government controlled. When I was there the farmers were getting \$3.75 per hundred for 3.5 milk which included a general subsidy of 40c. The government program actually rewards inefficient operators with an extra special subsidy to Northern Swedish farmers and to all farmers with less than 25 acres.

I was astounded at the low production per man in all of these countries. The very abundance of labor retards any attempt at mechanization to give them efficient, low-cost production. In all the countries I visited, farm labor was unionized; but the farmers didn't seem worried about it. However, at one farm in Italy I found that 25 men who were sort of loafing around the barn were the farmer's hired men on strike. They wanted 300 lire more a month, which actually amounts to about 50c in our money. It is the law in Italy that every farmer has to employ 21½ men per hectare (2½ acres) whether they need them or not. The average Italian farm worker gets the equivalent of about \$2.50 a week in our money, a house of sorts, and either some wine, milk or flour, depending on its being a vineyard, dairy or grain farm.

International Meeting

About 150 farm folks were in attendance at the International meeting and it was heartening to sit around the table with representatives of countries working together for mutual benefits when only five years before they had been on opposite sides in bitter World War II. One object of our meeting was to see if we could work out some way of getting better distribution of food to the deficient countries by breaking down restrictions, monopolies, high tariffs, etc. The

(Continued on Page 25)

Red Dane dairy cows usually are tethered on the small farms in their native Denmark and moved to new spots 4 or 5 times a day by the dairymen. In Sweden, however, practically all of the herds are fenced as shown in this photo Mr. Hawley brought back.

The *Barn Red* that Stays Red...

WHETHER you apply it yourself or hire it done—spray it or brush it on, G.L.F. Super Barn Red goes on farm buildings easily and smoothly. It gives lots of coverage per gallon. The color is a deep, rich red and . . .

It Stays and Stays and Stays

You can see barns in your neighborhood painted with G.L.F. Super Barn Red, ten, fifteen or more years ago that are still a real red, not faded pink.

Here's the technical reason: The iron oxide in Super Barn Red absorbs more of the sun's rays than other pigments, so it resists cracking and checking and weathers to a good smooth repainting surface. Extra protection against mildew is provided by a fungicide which is added to the formula.

And here's the basic reason: G.L.F. paints are made for farmers by their own cooperative paint plant. That's why they fit farm conditions to a T.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

Now is the Time to Get Your Farm Buildings in Shape For Winter

Unico Formula T House Paint

This is a first quality house paint, carrying a high percentage of titanium. Available in white and other popular house colors.

Paint Brushes

Carefully selected of top grade bristles for a smooth, professional appearance of the paint job. There is a size and quality brush for every type job.

Asphalt Roofing

Made of thick felt saturated with asphalt, and covered with a heavy coat of granules embedded in the surface. Clear, permanent colors.

Roll Roofing

Made of thoroughly asphalt-saturated thick felt, G.L.F. Roll Roofing guards against decay . . . protects against the elements . . . resists fire.

Aluminum Roofing

Aluminum roofing has exceptionally low maintenance expense and adds to the structural stability of buildings as well as neat appearance and weather insurance.

Liquid Asbestos Roofing Cement

The inexpensive way to restore life of weathered, smooth Roll Roofing. Forms a tough film of asphalt over felt of roofing which will not run in hot weather or crack in freezing weather.

3-Knot Roof Brush

A stiff fibre bristle brush designed for applying roof coating easily and smoothly.

G.L.F. PAINTS, ROOFING and ROOFING SUPPLIES

Are Potato Marketing Agreements Necessary?

By E. V. Hardenburg

BEFORE the 1950 crop of potatoes is harvested, New York and Pennsylvania growers will have to answer several questions which will have an important bearing on the future of their industry. They will have a chance to vote on marketing agreements. Meantime, they will do well to think about, read about, and discuss the issues involved. Even though it means no price support for the 1950 crop, Long Island growers have already said "no" by a vote of 2 to 1 that they prefer not to be regulated by restrictions which might be imposed by a marketing agreement and order.

Upstate New York and Pennsylvania growers will have a similar chance to vote by mail ballot sometime in August. Every grower of one or more acres of potatoes known to the State P. and M.A. office will receive a ballot and a copy of the proposed marketing agreement as published in the Federal Register of July 12th. Any changes from the form thus published will be the result of objections filed by growers or state marketing agreement committees before July 22nd.

How It Would Work

Details as to quality, grades and packs to be or not to be marketed in the regular channels of trade are to be established by the state committee if and when the agreement becomes effective, and are not therefore a part of the agreement to be voted on. The state committee to administer the marketing agreement will consist of 6 producers and 3 handlers. These members shall represent proportionately each of the districts into which the state has been divided. Compulsory Federal-State inspection of all potatoes would be involved except as exemptions are issued to cover frequent marketings of small lots which could not be conveniently or economically so inspected.

Nothing said by the writer here is to be construed as either for or against marketing agreements. His sole purpose is to point out some of the facts involved and to emphasize the importance of every eligible potato grower mailing his ballot during the 5-day period allotted. The terms of the agreement necessarily require the printing of several pages of fine print, and few will take the time to read them completely. But the issue is more than just "Do we want marketing of the 1950 potato crop regulated as a price to pay for price supports?" It involves the question of whether a free, competitive market, such as prevailed before the days of price supports and acreage

allotments, will be best in the long run.

In recent years, consumption of potatoes has declined with a constantly increasing variety of other vegetables and some complaint about the quality of potatoes marketed. Every year, average yields increase while total acreage decreases. Last year, we in the United States grew a surplus crop on the smallest acreage in over 70 years. Apparently we have not solved our surplus problem by reducing acreage through acreage allotments. Maybe we should not expect to, under government buying of surpluses and price supports.

As of July 1, the 1950 crop may well mean another surplus. It is not economically sound to expect a surplus crop to be marketed profitably, either with or without regulation. Compulsory grading and grade labeling have been suggested by a few well-meaning individuals as a solution. This can hardly be true for two reasons. Most potatoes in our retail markets are already labeled as to grade, but many of them are misbranded. The public and the trade know very little about established grades, and there has been too little enforcement of the "branding law" anyway. Would the enactment of more legal compulsions help solve our present difficulties? More laws have always meant more personnel for their administration and enforcement. This has helped to build our present enormous cost of government service and a tax burden almost impossible to eliminate.

Let's Do It Ourselves!

Obviously what the potato industry needs most now is (1) better grading, (2) an honest pack, (3) better internal quality, and (4) a program of merchandising originated by growers themselves organized to do the job. Unfortunately, we have let our potato industry slip into a position of public disrepute. This makes it easy to say that we now need government regulation to accomplish for us what we know would be good for us and what we, by all odds, should do for ourselves. Long Island growers took this issue seriously and got out a big vote. Maine and New Jersey, competing states, will operate this year under marketing agreements. Maine growers feel that Canadian growers have profited at their expense by filling markets usually taking Maine potatoes.

Upstate New York and Pennsylvania potato growers, how you vote is important, but under our democratic system it is even more important that you mail that ballot when the time comes!

This machine puts you WISE TO THE SUN

In winter, you want sunlight coming into your buildings for warmth and dryness. In summer, you want daylight, but with *direct* sun shaded out for coolness. The Solarometer, illustrated above, demonstrates the sun's position for any day or hour. It shows how an overhang or roof extension gives you sun control. This machine will be at the New York State Fair in Syracuse, September 2-9. We invite you to stop in and observe sun angles for your location.

Our Farm Department people will be there to discuss daylighting of farm buildings and its benefits to livestock health and production. They'll have data about *Thermopane** insulating glass—the double-glass window unit with dry air sealed between its panes. *Thermopane* lets you open farm buildings to daylight and sun heat, yet avoids excessive heat loss in cold weather.

If you can't attend the Fair, write us for information on the use of *Thermopane* for more comfortable homes and more healthful living conditions for livestock in service buildings.

Windows in the milkhouse and milking parlor at the fairgrounds are insulated with *Thermopane*. These windows flood the interior with daylight... keep heat out in summer and in in winter.

Thermopane

Allen Culver taking a buck rake load of hay to the barn on the farm of his father, Ralph Culver, near Springville, N. Y. This field, which is close to the barn, was seeded a year ago to broom grass, alfalfa and medium red clover. The field is well supplied with lime and had 250 pounds per acre of 8-16-16 fertilizer on the oats. There are 4 acres in the field and Ralph expected to harvest 10 tons of hay.

New York Artificial Breeders' Cooperative

THE EDITORIAL PAGE

TEN YEARS OF ARTIFICIAL BREEDING

PERHAPS the best proof of the remarkable progress made in ten years by the Artificial Breeders Cooperative with headquarters in Ithaca, N. Y., is a remark made to me by a dairyman attending the 10th anniversary meeting of the association in Ithaca on August 3 (see page 15). The speaker of the day had just asked his audience of over 2,000 dairymen: "How many of the 32,423 members of this Artificial Breeders Cooperative believed in artificial insemination ten years ago?"

The dairyman sitting next to me said in an undertone: "Not a third of us believed in it. I didn't."

The speaker, Dr. V. A. Rice, Dean of the Massachusetts State College of Agriculture, then went on to say that he believed that even more remarkable progress in the breeding of better dairy cows would be made in the future. He emphasized what artificial insemination had accomplished through the use of better bulls, and pointed out that equally remarkable progress would be made in the future. Dr. Rice emphasized the value of good families of cows as well as good individuals, and said that a calf was more likely to inherit the characteristics of its family than of its mother.

Dr. Rice also said that he had seen as many as 75 eggs from the ovaries of one cow, and stated that it should be possible before too long to find a method of fertilizing, at one time, several eggs from a high-producing cow, with sperms from a great bull such as those owned by the Cooperative; then grow each foetus in another cow, thereby producing several high-producing cows from one high producing dam. This possibility, said Dr. Rice, and many others are not beyond the research of scientists and dairymen themselves, and are "no more remarkable than what you men have already accomplished."

NO TIME FOR SOCIALISM

ASSOCIATE Editor Hugh Cosline sends me an office memorandum which reads: "Two recent headlines are illuminating. One said, 'Truman asks \$10 Billion to Halt Red Aggression,' and the other said, 'Veterans Administration to Provide \$150 Million in Housing Loans.' Another headline reads, 'Truman's Aids Seize Upon Korean Situation to Plug Proposals for Fair Deal.'"

It may be that \$10 billion for defense is justified, although one might well ask what has happened to the billions already appropriated to the military forces, with apparently too little to show for them. But with a war going on it is certainly all wrong, as Hugh indicates, to continue to spend millions on socialistic schemes which not only wreck us financially, but more important still, can deprive us of the liberties that have made this a great country.

COMING—A NEW EASTMAN NOVEL

MANY of you have asked me when I was going to write another story to run serially in *American Agriculturist*. Well, I have been working on one for a long time, and the first installment will appear in the next issue (September 2). It is called, "No Drums," and is a dramatic tale of adventure and romance. While the characters are fictitious, the story is written right out of the lives and hearts of farm people.

It has been a big job to write this novel, but it's been fun, too, and I hope you will get as much enjoyment out of reading it as I have out of writing it.

CONGRATULATIONS!

THE ADVERTISING Club of New Jersey recently conferred on Secretary of Agriculture Willard Allen the distinction of being New Jersey's "Citizen of the Year." "The award is given," said Mr. Richard Scudder, representing the award committee, "in recognition of Secretary Allen's many outstanding services to the people of New Jersey in connection with a wide range of both agricultural and civic

activities."

activities."

We of *American Agriculturist* say "Amen." Few, indeed, are those who are making a greater contribution to agriculture and citizenship than Willard Allen.

"WHY I MARRIED A FARMER"

MORE and more I am impressed with the big part a good farm wife plays in teaming up with her husband to make the farm successful and the home a better place in which to live.

The University of Illinois recently made a study of 240 Illinois farms to try to find out what a farm wife is worth. The study showed that on those Illinois farms where gross earnings are large, the married farmers average \$2,400 more in net earnings than the farms operated by the bachelors.

But of course the value of either a man or woman can never be measured in dollars and cents. The chief object of life is happiness, and there is no happiness to equal that of a good home and the lifelong, successful partnership of a man and his wife.

We of *American Agriculturist* receive many thousands of letters from farm folks during the year, and many of these are written by farm women. Not only do they write about the home problems, but also when the farmer has a question to ask us or a comment to make about some farm problem, he often asks his wife to write the letter. In these fine partnerships there is a sharing of responsibility, a talking over of the problems of both the farm and the home.

So we think that some letters from farm women on the subject of "Why I married a farmer" would be very interesting. *American Agriculturist* will pay \$5.00 for the best letter on this subject, \$3.00 for the next best, and \$1.00 for every other letter that we can find space to use. Letters should not be too long, not over 300 or 400 words, and less if possible. Be sure to sign your letter. If you do not wish to have your name published, please say so in your letter. The letters needn't all be on one side. If you have some criticisms of farming as a way of life, let's have them, too. Address letters to *American Agriculturist*, Department FW, Savings Bank Building, Ithaca, N. Y., and have them in this office not later than September 15.

FOR TREE RIPENED PEACHES

BEFORE THE WAR, Mrs. Eastman and I conducted a party of *American Agriculturist* tourists to the West Indies and Central America. One of my many pleasant memories of this trip is of eating delicious tropical fruits which were ripened naturally, instead of fruit which we Northerners get after it is picked green and shipped long distances. I remember, in particular, the pineapples. They were so sweet and flavorful, and so ripe that you could poke a finger into them.

This same principle of tree-ripening applies to some of our own fruits. For example, peaches from the store never taste like those ripened on the tree. If they did, I am sure the consumption of peaches would be materially increased. Porter R. Taylor, Director of the Fruit and Vegetable Department of the American Farm Bureau Federation, speaking on the subject of better peaches, said: "Much fruit is picked immature so that it can be shipped long distances without regard to its fitness to be eaten. Once growers have done their best to provide the market with peaches of quality they are entitled to receive the best efforts of both retail and wholesale distributors to move the product into consumption at a price that will be fair to consumers as well as to distributors."

Writing on this same subject in the *American Fruit Grower*, Harvey B. Hartline, a peach grower,

emphasizes the need to find some way to get riper peaches to the market without loss, and states that the proper box or package is a partial answer to the problem, and that it should be attractive in order to attract the consumer.

COOK OR PROCESS VEGETABLES FAST

WHEN WE ATE our first mess of early sweet corn this year, we commented on the fact that it did not seem to be very sweet. However, strange to say, after the first mess the same variety of early corn seemed to be a lot sweeter and better. What made the difference? The answer is that there was an hour or more delay between picking the first corn we had and cooking it. After that, we picked, husked and cooked our corn just before eating it. Even an hour's time between harvesting and cooking corn makes a difference.

Every year I am impressed all over again with the difference in the quality of vegetables cooked or put into the freezer immediately after they are harvested and those where there is a delay between harvesting and processing. One often hears a farmer say: "I can buy vegetables and small fruits cheaper than I can raise them." What he can't buy is quality. A good garden, including berries, plus a freezer, makes a big difference in the quality of the food we eat.

NORTHEAST A GREAT POULTRY COUNTRY

DR. A. B. GENUNG, Editor of the Monthly Economic Letter of the Northeast Farm Foundation, shows how poultry production in the Northeast has surged ahead in the fifty years since 1900. Poultry numbers increased in the United States as a whole from an index of 100 in 1900 to 214 in 1950. Poultry in the Midwest increased from 100 in 1900 to only 180 in 1950, but here in the Northeast the increase was from 100 to 260. The Northeast poultry business kept jumping ahead in the depression years from 1930 to 1940 and has kept on increasing since.

Dr. Genung points out that there are at least four reasons why the poultry industry flourishes in the Northeast states:

1. Better Markets.
2. Better bred stock.
3. Good poultry climate.
4. More "know-how."

EASTMAN'S CHESTNUT

CATS are funny critters. People talk about their having nine lives, but I'll bet in the last few years we have lost 25 cats on our farm because they didn't know enough to keep out of the highway.

On the other hand, I remember one time when we had an old cat at home that we thought a lot of. He took sick, and my brother thought the kindest thing to do was to shoot him. So he popped away at him and left him for dead, but when he came back a few minutes later to bury him, the cat was gone. A day or two later the cat came back, apparently none the worse for wear!

Which reminds me of the old chestnut about the airplane pilot who took a sick cat up in his plane, thinking that the best way to put him out of misery was to drop him over the side. Some time after he left, a neighbor, happening to call in, found his wife in tears.

"What's the matter?" asked the neighbor.

"John took the cat up in the plane this morning to drop him over the side."

"Well, that's nothing to worry about," said the neighbor.

"But it is, it is!" sobbed the wife. "John isn't home yet, but the cat is!"

Cal Coolidge said:

"Eat it up; wear it out; make it do!"

With rising costs and another war on our hands, that advice is better today than it ever was.

AA's Farmers' Dollar Guide

MILK: Leaders of associations of milk producers are worrying about the possibility that milk prices might be frozen as a war measure before the new Class I formula has a chance to bring prices more in line with costs. This danger is increased by the retail price war in New York City which has kept consumer prices below reasonable figures.

Under the new formula, the Class I price for 3.5 milk in New York for August is \$4.92. (Under this formula, the price does not go up and down in brackets representing even cents per quart.) If allowed to continue in effect, the formula should bring further Class I increases in coming months. Dr. Harry Young, economist for the Metropolitan Milk Producers' Bargaining Agency, estimates that the uniform price to producers shipping to the New York market will be about as follows: August, \$3.85; September, \$4.11; October, \$4.35; November, \$4.52; December, \$4.55.

WAR: At every meeting of two or more people the war is being discussed. This is as it should be. From here the following statements appear to be logical conclusions:

1. Appeasement did not stop World War II. We can hope that definite action now may prevent World War III.

2. With World War III a possibility, it is essential that government spending at home be cut to the bone. It should have been done long ago.

3. New socialistic schemes to better mankind through government spending should be abandoned.

4. If, as events indicate, some men in Washington see the threat of war as an opportunity to hasten and increase unnecessary government controls, all freedom-loving citizens should resist.

5. Every man, both on the battle front and on the home front, has the right to expect that, in the present crisis, our government servants make decisions without thought of political advantage.

PROOF: A conclusive argument against the Brannan Plan is furnished by the current egg situation. Consumers are paying about 25% less for eggs than they did a year ago. On the basis of Mr. Brannan's argument, consumption should be up considerably. Actually it is up less than 2%.

The USDA finds it practically impossible to dispose of food bought under price support programs. The House Agricultural Committee has given an O.K. to a proposal to pay packing and transportation costs on such food to be given cost to be \$44,000,000. Meanwhile government stocks of butter, dried milk, dried eggs and cheese are increasing.

INCOME: For July, cash farm income turned up after nearly two years of steady decreases. However, for the first seven months of 1950, national farm income was 7% below the same period in 1949.

POINTS OF VIEW: Most problems can be looked at from two or more sides. For example, take the growing of roughage for cows. You can shudder at the cash cost of lime, fertilizer and seed; or you can think of how much less cow feed you are going to have to buy in bags.

Also, when you look at the quality of your own pastures and meadows, you can compare them with the poorest grown by your neighbors and feel cocky, or with the best in your neighborhood or in the Northeast. If you take the latter viewpoint and it discourages you, why not find out why other dairymen grow better roughage and take steps to follow their example?

Again, when considering the purchase of a piece of farm equipment, a good viewpoint and it discourages you. Why not find out why other dairymen grow better roughage and take steps to follow their example? might save.

Perhaps these comments on points of view could have been said quicker with the old proverb, "Let your head save your heels."

GOOD MEN: When you hear or read about theoretical advantages of socialized medicine, old age pensions or similar socialistic government activities, ask yourself which of the three—democracy, dictatorship or socialism—has in the past produced the best and happiest men and women.—Hugh L. Cosline

August Farm Bulletin

This Month:

1. A tractor tire with a tread that penetrates sod.
2. Easy way to prevent broken trip ropes.
3. Caring for cows during hot weather.
4. For milkhouse use—get Special Gulf Spray!

1. A tractor tire with a tread that penetrates sod.

That tractor of yours represents a fair-sized investment. That's why it's just good "horse sense" to have good tires on it.

If your tractor slips and slides, it might pay you to look into the special high-cleated tread of the Gulf Rear Tractor Tire. Farmers are amazed at the way this high-cleated tread grips the soil—even bites right through sod. That means better traction—full power at the draw-bar.

The tread is open and flexible—springs dirt free. Tire shoulders are built extra high and rugged. And the open tread running down the middle gives you a cushioned ride, even on hard-packed soil.

See these famous Gulf Rear Tractor Tires at your Gulf dealer's.

2. Easy way to prevent broken trip ropes.

It's the easiest thing in the world to unhitch an implement and forget to unfasten the trip rope. Here's something almost as easy, that will allow the rope to unfasten itself.

Weld a spring clamp to your tractor seat post to hold the trip rope, and fasten a small ring to the rope. Then if a driver forgets to unfasten it, no damage is done.

3. Caring for cows during hot weather.

A cow can't do her best when she's annoyed by biting, buzzing, blood-sucking insect pests in the pasture.

If you've never used Gulf Livestock Spray, this is the ideal time to start. Take a few minutes just before milking time (night and morning) to spray your herd.

You'll find it does two things. First, it acts fast to kill flies and many other insects caught in its mist. Keeps cows quiet. No switching or fussing at flies when you're trying to milk.

Second, your cows can graze quietly for hours, freed from much insect annoyance by the lingering repellent action of Gulf Livestock Spray.

Used as directed, Gulf Livestock Spray will not impart taste or odor to milk. Nor burn or blister healthy cattle. Its insecticidal action is derived solely from pyrethrins (the natural insecticide), pip-eronyl-activated and contained in a non-staining, non-gumming, highly refined base oil. Usual price of Gulf Livestock Spray, \$1.69 a gallon. Your money back if not satisfied.

4. For milkhouse use—get Special Gulf Spray!

Special Gulf Spray is a fast-acting space-type spray, laboratory-formulated for use in milk plants and other places where food-stuffs are handled. It

quickly knocks out of the air, and kills, insects caught in its mist. Used as directed, Special Gulf Spray will not impart taste or odor to the milk. Usual prices: 1 gal., \$2.95; 5 gals., \$12.95.

The Song of the Lazy Farmer

THE folks who say that I'm no good, and do not work near like I should, may be quite right for most the year but have no point when August's here. I will admit that not a thing excuses laziness in spring; the brisk and tangy air of fall should never slow me down at all; and prob'ly I goldbrick somewhat when winter blizzards start to cut. But when late summer days begin to sap my strength and blood runs thin, I am not kidding when I say I'm worn out early in the day, and I make no apology for letting up this month, by gee.

In August, it just don't make sense to get myself upset and tense by trying to pretend that I have pep as great as any guy. The truth is I am tuckered out and cannot hardly get about; if I tried any other cure, except to rest, I'd fold up sure. And so I ask Mirandy, please, to set my rocker 'neath the trees, and once I've staggered out to it, I never do a thing

but sit. It is a favor to my wife, 'cause if I don't preserve my life, she'd lose the fun of raising hob when I lay down upon the job.

GULF

Gulf Oil Corporation
Gulf Refining Company

It's Here! NEW DEARBORN ECONOMY PLOW

with
**"RAZOR BLADE"
SHARES**

**CUT PLOWING COSTS TO THE BONE WITH SHARES YOU NEVER SHARPEN —
SO LOW PRICED YOU THROW USED ONES AWAY LIKE RAZOR BLADES**

BETTER PLOWING—LOWER COST!

1. Low-priced, easy-attaching "Razor Blade" shares. Come 6 to a box
2. Replaceable moldboard shin. Multiplies moldboard life
3. Extra heavy beams of finest steel
4. Heavy cross shaft mounted above beams for extra clearance
5. Handy adjustment for width of cut
6. Coulters adjustable — up, down or sideways—in front or back positions
7. Newly designed coulters bracket; holds adjustment securely
8. Extra long-lasting coulters hub bearings

(Coulters and jointers sold separately)

Here's the new plow sensation—a plow with new "Razor Blade" shares you never sharpen. Just throw the used ones away! In most soils, each share will plow at least as much land as one of the conventional type before becoming worn—and do it as well or better!

Lower cost plowing—shares cost only a fraction of the price of conventional shares! Better plowing—there's no need to use a share after it's too dull to do good work! No more time wasted and money spent on repointing or re-sharpening. Shares come six in a box—a new, sharp share always handy.

Repeated tests show savings, in shares alone, of up to \$40—and even more—per 100 acres plowed—depending upon the type and condition of the soil. And this saving is only part of your new plowing economy with the Dearborn Economy Plow.

Ask your Ford Tractor dealer for a Demonstration...

Begin now to get top quality plowing at a new low cost. See your Ford Tractor dealer and ask for a demonstration. Buy on PROOF that here is a better plow and better plowing—for less money. Remember, too, that your Ford Tractor dealer offers genuine parts, dependable service and a sincere desire to serve you well.

**MEANS LESS WORK...
MORE INCOME PER ACRE**

Growing Good Crops of Winter Wheat and Barley

By George Serviss

THE average yield per acre of winter wheat in recent years in New York State has been about 25 bushels; in New Jersey 23, and in Pennsylvania 21. This means, of course, that many farmers growing wheat on really good land, and fertilizing it well, harvested around 40 bushels to the acre.

Recently we have heard considerable talk about a 50-bushel-to-the-acre goal for the state of Indiana. I mentioned this to a Cornell agronomist and he told me that he could see no reason why New York farmers some day should not be able to produce 75 bushels to the acre on good land. We are not promoting this as a goal at present since we will need to work out different fertilizer practices and will also most likely need new varieties, but with the rapid strides being made today, we feel that such a goal for the future is realistic.

There has been a tendency in recent years to grow wheat on land not very well suited to it. Some of this land is too far north for wheat consistently to come through the winter in good shape, but most of it is too poorly drained. On land that is not well drained, heaving often results in the tearing off of many of the roots, the consequence of which is weakened plants. Then, too, there is the actual ponding of water in the low spots in the field in the spring. In spite of this, wheat has often turned out to be a better crop than oats on much of this land when it was sown on the early side.

Winter Barley

Last year at about this same time I said that from Northern Pennsylvania north, winter barley was somewhat hazardous. This proved to be true. While I have seen some excellent fields this year, I have also seen some that I doubted would be worth harvesting.

Winter barley is a more delicate and finicky plant than winter wheat. It will not tolerate wet feet at all, nor is it as resistant to low temperatures. It is also quite susceptible to mildew. Its lime requirement is as high as red clover, and I have seen many sick yellow fields where the soil acidity was too high. From northern Pennsylvania north it should be sown only on the very best soils, and even then one must be prepared to see it occasionally suffer severely from winter injury. But with wheat acreage restricted, it is probably the best substitute fall-sown crop for good land not north of the New York wheat belt proper. Through most of New Jersey and the southern part of Pennsylvania, winter barley seems to be a dependable crop.

Fertilizing Wheat and Barley

Irrespective of whether wheat acreage is allocated or not, it is good business to farm for high yields. One of the best ways for the average grower to increase yields is by more liberal fertilization, especially by the use of some extra nitrogen. Certainly, 350 pounds per acre of standard strength analyses such as 6-12-6, 5-10-10 and 4-12-8 or equivalent quantities of double strength is not too much. This appears to be more than the average grower is using for wheat. More than this might result in some injury to germination in dry years unless the fertilizer is drilled separately from the seed.

Research indicates that between 15 and 20 pounds of nitrogen per acre in a mixed fertilizer can be profitably applied at planting time, and that an additional top dressing with a straight nitrogen material early in the spring will usually be profitable unless the crop is to be top dressed with manure. To illustrate, 350 pounds of 5-10-10

(Continued from Page 16)

Soft Winter Wheat for Pastry Flour

THERE was a time when New York State was the leading wheat state in the nation.

While production now is small in relation to many western states, it is still a very important crop to a large number of farmers in the western and central part of the state. Wheat fits in the rotation very well and is generally considered a moderately profitable crop. There has been a big increase in production during the past ten years; and this year, while total U. S. production is estimated at about 8% below the ten-year average, the New York State crop will be nearly 50% above the average.

While considerable wheat is used for feed, large amounts are also sold to flour mills and for the manufacture of cereals, and this market furnishes a very important outlet. This outlet will be particularly important this year because the prospects for exporting soft wheat are very poor. Crop yields in European countries are reported as excellent, and with the development of war clouds in Asia there seems to be a disposition to expect European countries to do more to help themselves.

Superior varieties like Yorkwin and 595, which yield well and have excellent milling qualities, have been developed at Cornell. The production of new varieties of any crop is an exceedingly complicated procedure, usually requiring

cross-pollination of many varieties and the testing of the resulting plants not only for yield but for such characteristics as winter hardiness and resistance to disease.

One of the men who has been mainly responsible for the development of wheat varieties at Cornell is H. H. Love, who until recently has been in charge of the wheat breeding program since it started forty years ago. Others are the late W. T. Craig, F. F. Bussell and W. D. Swope. The characteristics for which these men were looking included, first of all, high yield; but along with this characteristic they were looking for a soft white wheat of excellent quality, a wheat that would not winter-kill and one that would have some disease resistance. Yorkwin was first released to farmers in 1935; and Cornell 595, which is similar to it but has a stiffer straw and a high degree of resistance to smut, was introduced in 1942.

Of course, New York State wheat is a soft wheat. It is used for pastry and cake flours by bakers, and in home baking for pastries, cookies, pie crust, cakes and other types of baked goods leavened with baking powder. The College of Home Economics at Cornell has been testing pastry and cake flours, milled from New York State wheat, and in an early issue we plan to give a report on its work, including some of the recipes it has developed.

FIRST IN SALES!

Ford Model F-5 shown, available with 95-h.p. Six or 100-h.p. V-8 is one of over 175 Ford Truck models varying from 95-h.p. Pickups to 145-h.p. Big Jobs.

FORD F-5

outsells every other truck in the 1 1/2 ton field!

The first choice of smart truck owners who use 1 1/2 ton trucks is the Ford F-5. National registration figures prove this heavy duty truck has outsold every other make in its class—bar none—in the postwar period. Since the war it has outsold the next leading make by a ratio of 5 to 3. Cash in on the experience of men who know trucks. Switch to Ford and feel the difference—in your pocketbook.

**FOR EVEN BIGGER LOADS,
GREATER POWER—THE FORD F-6**

• Choose Ford F-6, rated up to 16,000 lbs. G.V.W. on 8.25-20 duals. You get a choice of V-8 or Six in three great engines, including the new 110-h.p. Six.

FIRST IN VALUE!

**TEN WAYS BETTER
than the 4 other leading makes in the 1 1/2 ton field!**

Ford is first in sales because it is first in all-around value. In addition to low first cost, the F-5 offers farmers these 10 advantages over the next four leading makes in the 1 1/2 ton field.

(1) Up to 1,720 lbs. more payload capacity. (2) Up to 1,500 lbs. higher G.V.W. rating. (3) Up to 310 lbs. less chassis dead weight. (4) Widest (3 1/2-inch) rear brake shoe lining. (5) Highest compression ratio. (6) Only Ford offers a choice of V-8 or 6-cylinder engines. (7) Oil Filter at no extra cost. (8) One quart oil bath air cleaner at no extra cost. (9) Biggest clutch lining area. (10) The "Million Dollar" Cab for extra driver comfort, roominess, safety.

In the 1 1/2 ton field and in over 175 other models from 95-h.p. Pickups to 145-h.p. Big Jobs, Ford is America's No. 1 Truck Value. Do what thrifty and experienced farmers are doing all over the country. Switch to Ford Trucks.

Ford Trucking Costs Less Because—

CHOOSING an irrigation system is just like choosing a wife — what will suit one individual will not suit another."

That was the reply I got from W. H. Stout, president of Stout Irrigation, Inc., when I asked him what kind of irrigation systems should be used on Northeast farms. Since then a dozen or more engineers and officials, from as many companies, have told me just about the same thing in different words. There is no "universal" irrigation system. A hundred things have a bearing on the type of irrigation equipment that would be best for your farm.

There are a lot of questions about the farm and operations that must be answered even before a competent engineer can make definite recommendations. These were very well summarized for me by A. T. Race, Jr., president of the Race and Race Company which makes Racebuilt irrigation equipment at Winter Haven, Florida. He says an engineer requires the following information to do the right kind of a job:

1. The maximum available water during the dry season and the source, such as: lake, pond, well, ditch, creek or river.
2. Elevation from the water level to the field to be irrigated.
3. Distance from water source to irrigated fields.
4. The kind or type of crop, or crops, and their usual dollar value.
5. A layout showing outside measurements of the field to be irrigated, and the number of acres in the area.
6. The kind of soil, such as: light loam, sandy loam, etc.
7. The number of inches of water desired for application at one time to the crop.
8. The type of power desired for the system, such as: electric, diesel, gasoline, or possibly power from a unit already on the farm.

Trained engineers can take this information and make a complete recommendation covering the size and amount of pipe, size of sprinklers, size of pump, and engine horsepower required for operation.

Research Underway

The "unknowns" in the field of irrigation are not in the equipment. Engineers know almost exactly what performance they will get from all the different kinds of equipment, how much friction loss there is in various sized pipes, and exactly how much water the different types of irrigation equipment will put on a given area in a specified time. The unknowns lie in the field—in the actual application of irrigation. Right now, at research centers and agricultural colleges across the country, men are at work trying to find out just how much water to apply to various crops in different soils; whether it's better to have numerous light applications of water or fewer applications of larger quantities. Test plots will tell us how much closer we can space crops and how much fertilizer can be used profitably with irrigation.

The amazing results obtained by irrigating truck crops, potatoes, etc., are pretty well known. In a 1944 test at the Myron Hulse farm, Cranbury, N. J., potato plots got a total of 6 inches of supplemental water applied on June 5 and July 5, 13, 22 and 29. The increase in yield was 88.2 bushels per acre of U. S. No. 1 potatoes. This was an increase of more than 52%. Henry Talma of Riverhead, Long Island, has been irrigating potatoes and cauliflower for 14 years and is confident that a man with irrigation can expect increased yields of 50% in both crops. At New Brunswick, N. J., in drouth year 1949, nine irrigations of a total of 12 inches of water boosted yield 215 bushels to the acre over the same land

The perforated pipe system shown above requires the lowest pressure of the three systems of irrigation common in the Northeast.

Farm Irrigation for the Northeast

Water When and Where You Need It

By JIM HALL

Huge nozzles such as this one demonstrated at recent New Jersey Field Day require pressures of 85 to 120 pounds, but one will cover up to 3½ acres.

Medium pressure systems usually have 15 to 20 sprinklers at 40-foot intervals along pipe. One shown here also has a wheel every 40 feet to permit moving pipe without dismantling.

Here is the very heart of any irrigation system: First, an ample supply of water. It takes 27,000 gallons of water to put one inch on one acre. Second, a pump engineered for your system to provide ample power for your first requirements and any expansion of the system that you may want to make in future years. Illustrated is a Marlow pump capable of delivering 675 gallons a minute at 45 pounds pressure.

not irrigated. On truck farms, irrigation has assured producers three crops a year.

It's not so easy to check results in pastures. Limited research has been done at several colleges, but they are cautious about making recommendations. All seem to agree that it increases yields more than enough to meet the annual cost of applying water, but as yet they haven't enough figures to prove that increased yields are enough to pay off also the capital investment. However, Cornell University recently estimated that the average dairyman in New York could increase the carrying capacity and feed production of his pastures anywhere from 20% to 40% by irrigating. In New England, improved irrigated pastures are supporting four cows to the acre and thereby releasing many acres of former pastureland for growing crops of silage and grain.

One of the reasons why the Joslin Hill Farms of Leominster, Mass., sells irrigation systems is that they are sold on the value of irrigation on their farm. Charles W. Harris of Joslin Farms, who is especially enthusiastic about the Ames perforated pipe system, said that in 1949 they cut for silage some oats used as a nurse crop for alfalfa, irrigated the field with 3 inches of water, and then cut 30-inch alfalfa in just 5 weeks. Anyone farming in New England during last year's drouth knows that 30-inch alfalfa was a rare sight!

"An Inch in Time . . ."

Last year's drouth both helped and hindered the progress of irrigation in the Northeast. The lack of water—so bad in some states that the government declared them disaster areas—gave dairymen a jolt that they could feel right down to their pocketbooks. While some watched pastures burn up, others placed rush orders for pumps, pipe and sprinklers to save crops and keep up animal production. When they spoke of water and crops, they could rephrase the old saw and say, "An inch in time saved mine," while the rest were rushing around trying to buy forage.

Almost any kind of a system that will squirt some water on land will pay off during a drouth season, but "hurried" buying is not recommended by the reliable firms making and selling irrigation equipment. It's the men who bought hurriedly and under unfavorable conditions who find themselves with pumps or pipe ill-fitted for doing an economical job in normal seasons or who find, too late, that there are other systems or sizes available that would be more efficient for their particular farm operation. A well-engineered system, designed for the farm it's to be used on will profit the owner in normal years because there are periods in every summer when there isn't sufficient rainfall for best growing. (On Long Island, for instance, it has been 22 years since they've had rain at least once every ten days during the important growing months of June and July.)

Costs

Last Fall the University of Massachusetts issued a report based on studies of 14 farms with irrigation systems. They found that total investment ranged from \$1,500 to more than \$4,000. Per acre irrigated, this investment ranged from \$21 to \$160. They reported that with areas of 50 or more acres, initial cost can be kept to about \$50 an acre. The study revealed that physical characteristics of farms (i.e., water supply, distance and elevation to crop areas, and number of acres irrigated) have more influence on costs than anything else. One farm with 100 acres under irrigation had a central water source so that only 1,500 feet of pipe was required. Investment was \$2,082 and the annual cost per acre,

The Styleline De Luxe 4-Door Sedan

**So easy to operate . . .
so economical to own!**

You get a thrill of pleasure every time you see the sleek good looks of your Chevrolet! It's a thrill you'll enjoy for years, too, for Chevrolet has the kind of styling that lasts. Fourteen smart Styleline and Fleetline body types are offered, in a wide variety of sparkling color combinations.

You see where you're going and you like the way you go in Chevrolet! The wide curved windshield and generous window area give you vision that's tops for sightseeing . . . tops for safety. You're free to enjoy the luxury of "five-foot seats" . . . that rich Fisher Body interior.

Examine all of Chevrolet's big-car features. They look expensive. Then examine Chevrolet's prices—and what a pleasant surprise to learn it's the lowest priced line of all! That's why Chevrolet is America's No. 1 favorite . . . why you'll be better off in every way when you make Chevrolet your choice.

Grades and rutted roads a problem in your area? Chevrolet offers you two practical, thrifty solutions—the new 105-h.p. Valve-in-Head engine with Powerglide automatic transmission,* or the standard Valve-in-Head engine with Synchro-Mesh transmission. They're both equal to any road.

Chevrolet's roomy trunk takes care of your bundles on vacation or shopping trips . . . conveniently pops open at the twist of a key! Center-Point steering with Unitized Knee-Action ride, airplane-type shock absorbers and wider tread tires assure you a smoother and safer ride on all roads.

WITH **POWERglide**
AUTOMATIC TRANSMISSION*

Get ready to enjoy the simplest, smoothest driving in the low-price field when you step into a Chevrolet with Powerglide Automatic Transmission.*

For Powerglide takes most of the work of driving completely out of your hands. All you do is set the lever in "DRIVE" position, press on the accelerator—and go! There's no clutch pedal . . . no gearshifting to bother you. There's just a smooth flow of power from the big 105-h.p. Valve-in-Head Engine that carries you at any speed, over any road, without lag, drag or roughness.

Yours to enjoy, too, are all the other big-car advantages that Chevrolet offers . . . all the traditional features for comfort, safety and economy that Chevrolet alone in its price class brings you. So, see your Chevrolet dealer today. See for yourself why the smart and spirited Chevrolet is indeed the ideal farm car!

*Combination of Powerglide Automatic Transmission and 105-h.p. engine optional on De Luxe models at extra cost.

STOUT

gives you

**WHEEL-MOVE
IRRIGATION**

WHEEL Move Adaptable to pasture, grain, hay and row crops in fields 5 acres or larger. One man can move $\frac{1}{8}$ mile section in ninety seconds. Drains automatically. Available in 3", 4", 5" or 6" sizes.

What "Wheel Move" Does:

1. Hub coupler joins the forty-foot sections of aluminum pipe and then functions as an axle. Move one section and it all moves.
2. Quick action latch on the hub coupler keeps the pipe sections joined together. No wrenches needed. Easily disconnected.
3. Positive seal gaskets in the hub coupler provide a leak proof pressure seal as soon as normal water

pressure is applied.

4. Automatic drain valves open when water pressure is turned off, draining a complete line in approximately five minutes.

5. Converter couplers available so your present system can be easily and economically converted to a WHEEL MOVE irrigation by joining two twenty-foot sections of your present pipe to make a forty-foot section.

ALSO HAND MOVE AND TRACTOR
MOVE SYSTEMS AVAILABLE

**Farm Irrigation for
the Northeast**

(Continued from Page 8)

for four inches of water, was only \$11.39, including depreciation, interest, taxes, repairs, fuel, oil and labor. On another farm with 25 acres irrigated from a distant water source so that it required 2,800 feet of pipe, the initial cost was \$4,052 and the total annual cost per acre was \$33.80. An 18-acre piece with adjacent water supply requiring only 1,100 feet of pipe cost only \$1,598, but on an annual, per acre cost, the figure was \$22.06. These per acre costs are well under the value of a 50% greater potato yield or two extra tons of alfalfa per acre.

All three of these farms used a single giant nozzle. These "giants" or "Volume Guns," as one manufacture calls them, cover up to $3\frac{1}{2}$ acres as they slowly swing around and operate at 85 to 120 pounds pressure to distribute the water. To supply one of

Some medium pressure, multi-sprinkler systems are equipped with skids so that hundreds of feet of pipe may be towed to new locations by tractor or truck. Illustrated is an Ames "Tow-A-Line."

them, pumps have to be able to deliver around 550 gallons of water a minute. All this leads to high power costs with gasoline and oil costs totaling about \$4.50 to apply four inches of water per acre. Users of the giant nozzles recognize the higher cost for pumps and pipes built to handle high pressure, but feel that it is offset by its lower labor requirements. The big nozzles don't have to be moved as often, which is important in areas where labor is scarce, high paid, and doesn't like to get its feet wet too often.

In the Northeast, flood, furrow and ditching types of irrigation are seldom used due to the prohibitive cost of leveling our fields. That leaves just two principal methods of distributing water other than by giant nozzles. One uses medium pressure and water is sprinkled through 15 to 20 small nozzles placed at 40-foot intervals; and the other operates at low pressure, using perforated pipe instead of sprinklers or nozzles. Operating costs amount to about \$7.50, \$6.25 and \$5. per acre for the giant, small nozzle and perforated

(Continued from Opposite Page)
systems, respectively, for 4 inches of water per acre.

Most of the pipe used in irrigation is aluminum because it is so light and flexible and has such excellent non-corrosive qualities. Aluminum makes irrigation systems truly portable — a 20-foot length of 4-inch pipe weighs only 14½ pounds.

Most irrigation equipment manufacturers also agree on the sizes of pipe needed to keep friction losses at a minimum, but from that point on each manufacturer has his own ideas about such things as couplers, sprinklers and power assemblies. Some sell "packaged" units like the "Volume Gun" system of the Rainbow Mfg. Co. of Chattanooga, Tenn. Their "100-acre" system consists of a Volume Gun with 1,000 feet of 6-inch pipe and a gas powered irrigation pump. Others, like Shur-Rane of San Jose, Calif., make systems using everything from 2- to 8-inch diameter pipe with their own patented couplers and use any of a variety of sprinklers made by such sprinkler specialists as Rainbird of Glendora, Calif., Skinner of Troy, Ohio, and Buckner of Fresno, Calif. The Stout and Ames Companies both offer systems that can be towed by tractor from one location to another by uncoupling only one joint at the supply line. Stout also has a system threaded through hubs of steel wheels every 40 feet that enables one man to roll several hundred feet of pipe to a new location in a few minutes.

Pumps

The real heart of any irrigation system is the pump that sucks water from pond, well, or stream and then forces it through hundreds of feet of pipe under enough pressure to give equal distribution the full length of the system. Many kinds of pumps are available with the centrifugal pump being the most commonly used in sprinkler irrigation. Pump companies, such as Marlow at Ridgewood, N. J., Goulds at Seneca Falls, N. Y., and Gorman-Rupp at Mansfield, Ohio, specialize in portable models and can provide equipment for any installation whether it requires 50 gallons or 3,000 gallons a minute. Diesel and gas powered engines for the pumps are made by such well known firms as General Motors, Chrysler, Ford, Wisconsin, Briggs and

Stratton, and Le Roi. Some pumps use tractor power take-off.

Men experienced in results obtained by supplementing natural rainfall, think that nearly all farmers along a river or creek could profitably use some irrigation and predict that someday more than 80% of the vegetable growers and more than 30% of dairy farmers in the Northeast will own irrigation systems.

The only limiting factor seems to be water. I'd like to emphasize that it takes 27,000 gallons of water to put an inch over an acre! Your county agent will help you find a state engineer to check the flow in your creek or pond, and irrigation company engineers can figure out whether it will be cheaper for you to drill for extra water or invest in more pipe to bring it to the field from a greater distance. You'll find this engineering service free, and it might save your investment.

In New York and most other states the rights for use of water for irrigation have not been established in the courts, so I suggest that before making a big irrigation investment based on using water from a creek, farmers should be sure there'll be enough water even if neighbors on the same creek also decide to use it for irrigation purposes.

(For readers who want more details on irrigation, we have prepared a mimeographed list of the leading irrigation equipment companies supplying the Northeast, together with their addresses and a brief description of their products. For a copy write Jim Hall, American Agriculturist, Ithaca, N. Y.)

Marlow SPRINKLER IRRIGATION PUMPS

. . . engineered for the modern farmer

These efficient and reliable Marlow centrifugal pumps embody the latest features for modern sprinkler irrigation. They are engineered especially for today's new pressure and capacity requirements and are thrifty and virtually maintenance free in operation.

Marlows are available in a wide range of models for any sprinkler irrigation job. Sizes 2" to 6 inches, including two models designed specifically for the new 2- and 3-acre sprinklers. Capacities 50 to 1500 GPM; pressures 30 to 200 PSI. Powered by gasoline and Diesel engines that are equipped with the latest safety features. Choice of skid mounting, or steel wheels or rubber tires. Also models for electric and belt drive.

If sprinkler irrigation is the question, Marlow is the answer. Write for name of the Marlow dealer nearest you.

The Question Box

We have an aluminum roof and want to install lightning rods. We have been told that copper should not be used. Is there any basis for this idea?

Copper lightning rods are not recommended for use on an aluminum roof because of the electrolytic action which will take place between the two metals. Such electrolytic action will cause damage to the aluminum roof. — D. W. Bates, Dept. of Agr. Engineering, Cornell University.

Is it practical to raise asparagus plants from seed?

This can be done but most gardeners prefer to buy and set out plants because it saves them a year of time. The principal difficulty of raising plants from seed is that they germinate very slowly, usually taking from 4 to 6 weeks, therefore, the plants may be smothered in weeds. Also, they need to be thinned while they are still small to give room and to avoid intertwining of the root systems which makes it difficult to separate plants when they are transplanted.

We used to enjoy buttermilk when we skimmed it by hand, but since we have been using a separator the buttermilk doesn't seem to be nearly as good.

I am not surprised at the difference you have found between buttermilk made from cream skimmed by hand and from cream made by the centrifugal separator. Please do not blame the

separator, however. You have not said so, but I suspect you are separating warm, raw milk by the machine; previous to that you were separating cold milk. In other words, you cooled your raw milk, permitted the cream to rise, and then skimmed the surface material. The difference in quality is largely caused by this difference in temperature treatment.

Again you did not say so, but I assume that your buttermilk has a bad flavor. This bad flavor is caused by the activity of an enzyme called lipase. This enzyme may be destroyed by heating your milk immediately after milking to 130°-140° F. before separation. I believe this treatment will improve the quality of your buttermilk. It may not, however, give you as good a product as you have previously obtained by hand skimming. — R. F. Holland, Dept. of Dairy Industry, Cornell.

Why is it that we seem to be unable to grow carrots with long, smooth roots like we buy in the store?

This is partly due to variety. Usually a carrot variety which does not grow to extreme length will give better results in the garden. Where carrots are not thinned they are likely to be misshapen. Also, a number of factors causes the branching of roots such as the presence of undecayed manure, any injury to the root or any impediments such as a stone.

Growing Good Crops of Winter Wheat and Barley

(Continued from Page 6)

supplies 17½ pounds of nitrogen, and 60 pounds of ammonium nitrate furnishes 20 pounds. Phosphoric acid and potash, though, are definitely needed at planting time except possibly where wheat or barley follow a very heavily fertilized crop.

Sowing Date

The Hessian Fly seems to be on the increase in wheat areas of the Northeast after having been a negligible factor for several years. It caused serious damage in some fields this past year. At this time it appears that it is likely to pay to observe the Hessian Fly free planting date in the areas in which there is any concentration of wheat at least. This date differs from area to area and will, no doubt, be announced by County Agricultural Agents.

Varieties

The variety situation seems quite well stabilized at present. In the western New York white wheat area the choice should be between Yorkwin and Cornell 595. In Pennsylvania and New Jersey, Thorne, a red variety, is the logical selection. When it comes to winter barley, Wong is outstanding.

Use Treated Seed

We have seen more smut on all the small grains this year than we have ever seen before. On many of the fields the seed was definitely treated with the usual organic mercury compound. This, though, is not very effective against loose smut, which was the kind most prevalent this year. It does give excellent control of covered smut.

The spores of covered smut are on the outside of the seed only. Loose smut spores are scattered by the wind, and the disease may also be present within the kernel without being detected. The best treatment for loose smut is what is known as the "hot water" treatment. This is cumbersome and difficult, since you must have perfect temperature control. If the temperature goes a

couple of degrees too high, there will be too much injury to germination; if it is a couple of degrees too low, it won't kill the smut. Unfortunately, the method is impractical for the farmer and also treating any substantial volume, but it is practical for foundation seed that is to be multiplied for commercial seed. Fields containing any appreciable amount of loose smut should not be used for seed.

It's Handy

Welding a piece of steel or the lower end of a chisel on the top of the hoe will enable you to cut the larger roots and weeds which the hoe will not be able to cut. Where larger weeds are found, this piece of metal can be put under the base of the weed to pull out the entire weed rather than just cutting it in two.—Adam Szczepanowski, 716 W. 4th St., Michigan City, Ind.

Making A Funnel

If you do not have a funnel and you need one in a hurry, take a long-necked bottle and cut the bottom off. To cut the bottom off, use the corner of an emery wheel; turn the bottle two or three times around about one-half inch from the bottom. When the bottom drops off, you will have a good funnel.

—Edward Juda, Ware, Mass.

When you can feed KAFF-A

The safe replacement for milk!

Sell your cow's milk! Don't waste it, on your calves. That's just like feeding them dollars! Low cost Kaff-A is an absolutely safe replacement for milk! When you feed Kaff-A, the milk your cows produce goes to the dairy—puts dollars in your bank account. Just 1 lb. of Kaff-A can replace up to 10 lbs. of milk in calf feeding. That means every 50 lb. box fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! That means a handsome extra profit!

With Kaff-A no milk is needed after the 10th day. Kaff-A is tested, tried, proved

a safe replacement for milk. A million healthy heifers have already been raised on it! Its dried buttermilk base is known for its nutrition. In addition, Kaff-A contains other dairy by-products, some cereal products, and plenty of Vitamin A and D Feeding Oil!

Don't risk your calf's health on inferior imitations of Kaff-A. A few pennies saved now may cost you many a dollar if your calf becomes a stunted cow. Feed Kaff-A and be sure that your calves get the nutrition that helps develop good milkers . . . good breeders!

Aberdeen—Angus First Production Sale
at the Farm, Wednesday, September 13th

Catalog on request

Great Eastern Circuit Aberdeen Angus Sales

Two hundred females and 15 bulls—all outstanding Aberdeen Angus individuals—will be sold at the four important sales on the Great Eastern Circuit, Saturday, Monday, Tuesday and Wednesday, September 9, 11, 12 and 13.

The Sales Circuit starts Saturday, September 9, at Shadow Isle Farm, R. F. D. 1, Red Bank, N. J. Dr. and Mrs. Armand Hammer, the owners of Shadow Isle Farm, have an excellent line-up for this sale consisting of 68 head—8 bulls and 60 females.

Continuing, the Sales Circuit moves from Red Bank, N. J., up to Dutchess County, Monday, September 11, to Fuerst Stock Farm, Pine Plains, N. Y. The Dutchess County Sale will open with a cattle parade at 10:00 A. M. Monday conducted by Mr. Kenneth Litton, manager of Highland Farms, Round Hills, Va. Twenty-two consignors have made selections from their best cattle and 54 heifers will be sold. Bill Landauer says that last year at the Dutchess County Aberdeen Angus Breeders Sale a unique sales plan was started. Anyone who buys cattle at the Dutchess County Sale can consign the get of purchased stock to future Dutchess County Sales. There are eleven consignors who are taking advantage of this plan this year.

The following day, Tuesday, September 12, Rally Farms, Millbrook, N. Y., F. H. Bontecou, owner and Obed Potter, manager, are offering 50 heifers including 12 heifers bred either Eileenmere 1026 or Ellerslie Prince 25th.

The final sale on the Circuit, Wednesday, September 13, will be the First Production Sale of Cochran Farm, North Salem, N. Y.

Bill Landauer of "Rufflands," Red

Hook, N. Y., of the Dutchess County Aberdeen Angus Breeders, who has coordinated the sales of the Great Eastern Circuit, expects a record-breaking attendance at these sales, all of which will start at 1:00 P. M. on the date of sale. Bill tells us that he will be glad to arrange for transportation and hotel accommodations for visitors attending any of the sales. He assures us that the quality of all animals offered in the Great Eastern Circuit Sales is such that purchasers will not have to worry about starting over again next year.

NEW YORK STATE FAIR CATTLE SHOW

Professor George Trimberger of Cornell has been named superintendent of the Cattle Show at the Syracuse State Fair. Premiums for the Show total \$22,200 and entries are expected to exceed last year's record of over 1,500.

Judging will begin Monday, September 14, at the colosseum where spectators can watch the different classes from comfortable seats. The judging of beef cattle will start at 11 a.m., Wednesday, and judging for both dairy and beef cows will be completed by 5 p.m. Thursday.

— A. A. —

MORE GRASS SILAGE CONTESTS

In addition to those fairs listed in the July 1 *American Agriculturist*, the following will also have competitive grass silage exhibits this year: Hillside Agricultural Society, Cummington, Mass., August 26 and 27; Washington County Fair, Greenwich, N. Y., August 22-26. Both will offer cash prizes for first, second and third places.

Dairymen Celebrate 10th Anniversary of N.Y.A.B.C.

By ROBERT EASTMAN

MORE than 2,000 farm folks took part in a day-long pause in the operations of the world's largest dairy cattle artificial breeding organization in Ithaca, Thursday, August 3rd to celebrate the tenth anniversary of New York Artificial Breeders' Cooperative, Inc. Delegates attended the annual meeting representing 68 affiliated breeding associations from New York State and Western Vermont, which during the fiscal year ending May 31 provided breeding service to 156,012 cows in the herds of 32,423 member-owners.

Comment on the program of displays, exhibits, speakers and annual meeting business indicated that the show matched the importance of the ten year celebration to the dairy world. Said Lawrence Beckerink, dairyman of Clymer, New York, "I came 230 miles to see this show and it was worth it."

Ready To Go

Pulling no punches in either his subject matter or his anecdotes, principal speaker Dr. V. A. Rice, Dean of the Massachusetts State College of Agriculture and a nationally known authority on dairy cattle breeding, congratulated the cooperative on its progress in the past ten years, but told his audience that the organization was "just at the age of puberty," and still has a long ways to go to provide maximum service.

Tackling his subject "Where Do We Go From Here in Breeding Better Dairy Cattle" Dr. Rice told his audience that dairymen must place increasing emphasis on the "family" characteristics of cows to be bred. "Artificial breeding," Dr. Rice said, "gives everybody that's got the sense to use it a chance to use the better bulls." He added, however, that the offspring of a given cow is more likely to reflect the general characteristics of the cow family than of the cow herself. Therefore, he said, it is a dairyman's responsibility to maintain comprehensive herd records.

Dr. Rice also warned that sires and dams actually transmit "potentialities," rather than "characteristics" to their offspring, and full development of potentialities is the responsibility of the dairyman.

Selecting Breeders

Factors in herd improvement outlined by Dr. Rice were: Physiology of Reproduction; Inheritance; and Selection and Systems of Breeding. He noted that the last named factor is the only one over which we actually have any control since the others are natural processes. While he did not condemn cross-breeding, Dr. Rice declared that a given amount of effort would produce better results for a dairyman who confined his program to a single breed of dairy cattle.

The morning period of the all-day session was devoted to the judging and placing of 46 selected producing dairy cows which were the result of breeding to NYABC sires. Placing the animals according to their type and production was Professor K. L. Turk, head of the Animal Husbandry Department at Cornell University, assisted by Professors Raymond Albrechtsen, and Robert Spalding of the same department.

Judging Winners

The audience also took part in judging 12 of the animals, and Preston Roberts of Jefferson County took first place in the contest.

Owners of winning animals in the judging competition held prior to the

ATWOOD'S 92 Washington St.
 Binghamton, N. Y.

Miss Maxine Torrey of Stafford, Genesee County, was chosen Empire State Potato Queen at the 17th annual potato field day at Chafee, N. Y., Aug. 3. She is shown here with H. J. Evans, (left) President of the Empire State Potato Club, and Maurice Phelps on whose farm the field day was held.

14,000 See What's New at Potato Field Day

WE'VE HAD larger crowds on at least a couple of occasions but never have I seen such genuine interest in demonstrations and equipment as was shown here today," said H. J. (Red) Evans, president of the Empire State Potato Club at the close of the Club's 17th Annual Field Day at Chafee, Thursday, August 3.

Maurice Phelps, well-known Erie County potato grower, was host to the crowd but demonstrations were so extensive that much of the parking and a giant plowing demonstration were held on the adjoining 325-acre grain and turkey farm of the brothers Tom and John Lloyd-Jones.

Cooperating in the field day were experts from the College of Agriculture at Cornell who demonstrated on College plots such things as yield tests of 24 new varieties, potato diseases, potato digger and planter adjustments, and changes that have taken place in seed spacing and fertilization. Several branches of the College had educational exhibits at the field day and experts on hand to answer disease and other problems brought to them by hundreds of growers.

Highlighting the entertainment was the crowning of Miss Maxine Torrey of Stafford, Genesee County, as the 1950 Empire State Potato Queen. With Don Huckle of Buffalo radio station WGR

acting as master of ceremonies, the crowd chose Miss Torrey and the crown was placed on her head by last year's potato queen, Mrs. Richard Amidon of Lafayette, N. Y. The new queen is the daughter of Mr. and Mrs. Elbert G. H. Torrey who grows 200 acres of tubers on their 1,200-acre farm. Other county queens in competition for the state crown were: Betsy Stafford, Warsaw, Wyoming County; Gertrude Butzer, Collins, Erie County; Mary Adsitt, Lafayette, Onondaga County; Wilma Gibson, Wayland, Steuben County; Janet Merwin, Fillmore, Allegany County; and Catherine Dackowsky, Cassville, Oneida County.

Other royalty present for the coronation were the New York State Vegetable Queen, Joyce Dowleaire of Webster, and the Pennsylvania State Potato Queen, Donna Mae Gooderham of Patton in Cambria County. The new New York State Potato Queen will compete at the State Fair in Syracuse for the coveted State Queen title.

While there was great interest shown in the demonstrations, it was second to that shown in the huge display of all kinds of farm equipment. Along a quarter-mile 'street' jammed with the products of about 50 dealers and manufacturers was a constant stream of farmers from before 9 o'clock in the

(Continued on Opposite Page)

One of the main reasons for the big crowds at Empire State Potato Club field days is the extensive trade show put on by equipment dealers and manufacturers. Shown here looking over a new 2-row Iron Age digger are, from left: Elton Benkelman and Edward Mackensen, both potato growers of Springville. At right is the company representative, Bob Witter of Arcade, ready to answer questions.

With
AMERICAN AGRICULTURIST
 Advertisers

For any dairyman with less than 10 cows, the DE LAVAL SEPARATOR COMPANY, Dept. 123, 165 Broadway, New York 6, N. Y., suggests the new De Laval Speedette Milker.

A new idea in cereals is Post's "Sugar Crisp," made of puffed wheat, toasted and coated with sugar and honey. It is designed not only for use as a cereal to which only milk or cream needs to be added, but also as a between meal snack and a confection.

SAM DANIELS MFG. CO., Hardwick, Vt., has just put on the market an improved Chunk Furnace with large fire door, for burning local wood and odd sized chunks. It is claimed by the manufacturer to be very efficient and to give ample heat for an average size home, camp, lodge, schoolroom or logging camp. Because of the large door this furnace is easy to fire and easy to clean. Full information may be had by writing to the manufacturer.

THE A. B. FARQUHAR COMPANY of York, Pa., says that their orchard mist sprayer will apply concentrate spray in an air stream traveling from 95 to 125 miles per hour and at a rate of 12,000 to 18,000 cubic feet per minute. This makes it possible to break up concentrate sprays into a fine mist which licks pests and diseases in the modern way.

The Disston Saw, Tool and File Manual is chock full of valuable information on the choosing of tools and their care. If you would like to have a copy, drop a postcard to **HENRY DISSTON & SONS, INC.**, Tacony, Philadelphia 35, Pa.

THE ANDERSON MILKER COMPANY of Jamestown, N. Y., has a new vacuum milk strainer attachment. There is a rubber tube running from the strainer to the vacuum line of the milker which pulls the milk through filter disks as fast as it can be poured into a strainer.

Any **American Agriculturist** subscriber can get a free sample of **Kowtows**, the single service paper towel for washing udders. Just fill out the coupon on page 11 of the July 15 issue and send it to **BROWN & COMPANY**, Dept. K-67, 500-5th Avenue, New York 18, N. Y.

The National Fertilizer Association has recently completed the third printing of a pamphlet in color called "Hunger Signs in Crops." A copy will be sent to any **American Agriculturist** subscriber on request to the **NATIONAL FERTILIZER ASSOCIATION**, 616 Investment Building, Washington 5, D. C.

A complete water system in one unit made by **JACUZZI BROTHERS** of Richmond, California. Although the unit is only 27 inches high and 16 inches through, it will pump 250 gallons an hour from a depth up to 22 feet.

Litter + Chickens + Time = Built-Up Litter

By L. E. WEAVER

A YEAR ago at the annual meeting of the Poultry Science Association, a man from the Experimental Station at Wooster, Ohio, told of the astonishing benefits of re-using old built-up litter in brooder houses and laying houses. Think of all the time and hard work spent when you clean out all the old litter, then scrub and hose down the pen with water, and finally spray it with disinfectant. You don't avoid all that outlay of time and effort when you re-use the old litter, but you do avoid most of it.

You must get out the big lumps and the packed-down portion, leaving only a dry, almost powdery mulch of suitable depth for dust baths. The time and effort you will have to spend now in getting the laying pens ready for your new crop of pullets will depend on how successful you were in managing your built-up litter last winter.

Blessing in Disguise

But the health-promoting properties of re-used litter may be an even greater blessing than its labor saving. I know it sounds preposterous to say that old litter can promote better health. Haven't we been telling you for years that old dirty litter is probably reeking with infection, filth and death for your pullets or chicks? Of course we have, and we were not too far wrong; just wait to the end of this story. However, Professor Kennard had plenty of proofs that he knew what he was talking about. Baby chicks that were started and grown on old litter that was dry and fine did not die off at anything like the rate they had died in previous broods started in cleaned and sterilized quarters. He showed that honest-to-goodness built-up litter is the form of good sanitation, and furthermore that it can contribute to good nutrition—both of which are health promoting.

According to Kennard, old built-up litter contains a lot of the Animal Protein Factor (APF) which is one of the main reasons why meat scrap and fish meal are such valuable poultry feeds. Apparently there are favorable bacteria in built-up litter which produce APF. So you might feed a ration that was low in APF and your chicks or pullets would never miss it. They would do practically as well.

Built-up vs. Dirty Litter

Now for another side of the picture. At the same meeting a year ago, a man from Massachusetts warned of the danger you face when you re-use "dirty" litter. I hope you notice the difference in terms. The Ohio man talked about "old built-up" litter and the Massachusetts man about "dirty" litter. There is a difference, and results, too, were different. This practice of putting new pullets on old built-up litter, where it is still in good condition, has been followed by a lot of people in the State of Massachusetts in recent years.

Perhaps Professor Jeffrey wanted to see just how far it is safe to go. He used litter that was really dirty. It had been used before, and it was right next to a room where market poultry was slaughtered. Caretakers could and did walk from one room to the other when the floor was littered with feathers and blood. As you would expect, this rearing on "dirty" litter was a failure. I wrote about all this once before but wanted to review it here as an introduction to our real topic.

Real built-up litter is something

quite different from a mere mixture of fresh straw and poultry droppings. It is similar to compost from a compost pile. It is a lot of organic matter undergoing a fairly rapid change to humus in the presence of moisture and nitrogen from poultry droppings, as a result of the activity of favorable bacteria. Time is one of the essentials in establishing an effective absorbent, sanitary built-up litter. Time is needed for the original litter material to be broken up by the scratching of the pullets, for bacteria to increase to effective numbers, and for the composting action to get started. With plenty of time, plenty of any common litter material, and plenty more added from time to time, you will eventually get a deep, practically self-drying litter.

May Be Started Any Time

Here is what Professor Kennard says in a recent publication: "Built-up litter can be started at any time. It is important that the start be made with a generous amount (4" to 6") of litter and that additions be made as needed when it starts to paste over the surface. None should be removed until necessary to keep it within a convenient depth of 8" to 12".

If you must start with new litter, it is none too soon to make that start now. If you really have old built-up litter that can safely be re-used, an early start is not so urgent. Old built-up litter can be re-used safely if no contagious diseases have been present in the old flock during the past year. A mortality rate of not more than 12 to 15 per cent of the original number of pullets would be normal and would indicate freedom from serious disease.

I should add that the owner of one flock where round worms had become a problem attributed this to built-up litter. It could be true. I think that where round worms have been present to a serious extent, the old litter should not be re-used. Giving the pullets a worm treatment would give only temporary benefit.

— A. A. —

POTATO FIELD DAY

(Continued from Opposite Page)

morning until well after 4 o'clock in the afternoon. New tractors, plows, mechanical vine killers, mowing machines and rakes attracted almost as much interest as the new diggers, planters, graders, dusters, sprayers and harvesters.

Most spectacular of the equipment demonstrations were those of the irrigation dealers. From a pond at the foot of the dealers' "street" they squirted water through almost every type of irrigation system in use in the Northeast. Another crowd-appealing demonstration was the plowing show on the Lloyd-Jones farm. A whistle blew and 24 different tractors, pulling as many different kind of plows, started to work on a 10-acre field. It was heavy going after an all-night rain in a high stubble field from which the wheat had just been combined, but an hour later the job was done. During this show, farmers had a chance to see and compare the kind of job done by rotary tillers, heavy disc-plows, spring-tooth plows and every kind of conventional mold-board plow from the single-bottom 14-inch to the giant, Diesel-drawn 4-bottom variety.

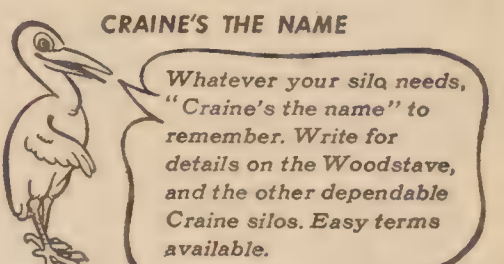

For the convenience of growers, the Club stages the field day in a different part of the state each year. The 1951 show will be in Central New York next summer, probably on an Oneida County farm.

CRAINE WOODSTAVE . . . a heavy duty beauty!

Here's the wood stave silo that dairymen everywhere call "the very best." Famous Crasco door front—3-ply doors swing freely on outside bail hinges. Built-in ladder is handy, safe . . . adds to silo stability. Simple, strong double anchorage system.

It's built for long, rugged service . . . profitable feeding.

Craine, Inc., 820 Pine Street, Norwich, N. Y.

In remodeling or repairing your home be sure to use reliable equipment and good materials. Patronize American Agriculturist advertisers and you will be satisfied.

By J. F. "Doc" ROBERTS

THE TRUEST tribute we pay our friends is to miss them when they are away. Ed Babcock, we miss you. Fred Schilling, we miss you.

Again this is tough, not only to see our friends passing, but to see all of us passing through another pre-war stage. This one bids fair to become the toughest period of our lives, whether it proves to come now or holds off for a while.

Our livestock markets are on a war basis. This does not mean that livestock prices have gone straight up. In fact, they are lower on every specie than thirty days ago. War markets fluctuate with the wind while consumer prices remain almost constant, due probably to increased production, and with sporadic government buying.

War market prices for livestock are controlled more by what the government does than by straight consumer demand. This price control depends upon when, where and how much the government buys, as well as upon the ceilings, price controls and price freezes they place upon the consumer. Hog prices have gone up and down sharply this week. The government has bought a good deal of lard recently, but fresh pork demand has fallen off. So it goes and will continue to go with war and threats of war.

I think we can anticipate controls, ceilings and price freezes all over again, perhaps not before elections this fall but probably soon after. There is no excuse for hoarding, which in the long run always proves expensive even

though we all know that the day these "controls" are put on nearly everything we want will disappear from regular market channels almost over night. Is it possible that we have to go through all this damage to morale, good will, honesty and incentive all over again; or is it just a bad dream? I only wish it were.

The influence that long association with the specific type of animal that we produce brings was again vividly exemplified the other evening. I attended a state sheep meeting banquet. The entertainment included some talking movies of Australian sheep raising, etc. About half way through, the talking stopped, but there was not a sound from those sheep men and women. In just a few minutes the picture also went completely out, and still not a sound in that dark room full of people. My point is this—just imagine or picture for yourself the chatter if that had been a chicken meeting, the noise and guffaws if a horse meeting, or absolute bedlam if a dairy meeting.

Now the question—is the sheep man that way because a sheep is that way, or is the sheep that way because of the man—or the chicken, or the horse, or the cow? This is not all facetiousness either, but really something for the young man who is going into livestock to figure out for himself before he picks the specie for his life work.

Referring to farm machinery, again some are agreeing that new metals, new plastics, concentrated research by farm machinery people and engineers (with the assistance of farm organizations and farmers themselves) could improve our equipment and eventually even make it possible to buy interchangeable parts, standard threads, etc., for all types and makes of farm machines, thus avoiding delays and breakdowns. Another comment has been that I did not grow up in the machine age but that our young men have, and that explains my troubles under conditions where the youngsters do all right. I must admit that I have hitched on more whiffletrees than I have power take-offs.

— A. A. —

DAIRYMEN CELEBRATE NYABC ANNIVERSARY

(Continued from Page 15)

business meeting were: Stanley Jursick, Tompkins County in the three-year-old Holstein class; James Sears, Onondaga County, in both four and five-year-old Holstein classes. Winning Guernsey (all ages) is owned by James

Wilson, Tioga County.

In his report Manager Maurice W. Johnson of Ithaca expressed the organization's pride in the conception rate now at the highest point—72%—in the ten year history of the organization. "I predict," Johnson said, "that in years to come, more and more dairymen will use this artificial breeding program in their herds, and will receive much greater satisfaction as the resulting offspring come into production."

In addition to approving the Secretary's report presented by James L. Sears of Baldwinsville, and the Treasurer's report presented by A. W. Thompson of Trumansburg, delegates also approved a budget for the 1950-51 fiscal year, and approved minor changes in the organization's by-laws.

A report of the nominating committee was presented by Myron Albro of Lounsberry, New York, chairman, and the following directors were elected:

Benjamin Foster, Middlebury, Vermont, representing NYABC District 7; Arthur Hoose, Fishkill, N. Y. to serve District 8; John Hollowell, Penn Yan, N. Y., representing the Ayrshire breed; and Edmund Schillawski, Auburn, N. Y., representing the Brown Swiss breed. The new directors will meet with the full 13-man board consisting of eight representatives of districts, and one representative for each of the five dairy breeds served by the Cooperative.

At the directors' session after the annual meeting, all officers of the 13-man board were re-elected. They include: J. Stanley Earl, Unadilla, president; George Pringle, Lounsberry, vice-president; and James L. Sear, Baldwinsville, Secretary-Treasurer.

MINRALTONE HELPS BUILD CHAMPIONS

Here's a group of daughters of Good Acres Advancer, Approved. Good Acres' outstanding herd of Ayrshires is noted for its uniform good health and high production. They're MinRaltone fed.

Good Acres' Outstanding Herd Protected Against

HIDDEN HUNGER*

Good Acres, a 1000 acre farm at Waynesboro, Pa. boasts 250 head of fine Ayrshires. The herd's excellence is widely known—and judging from the photograph above, it will continue to produce standout Ayrshires.

Mr. D. W. Good is owner of Good Acres; Franklin C. Goshorn, Manager, and Charles A. Wagner, Herdsman. According to these men—"We've been feeding MinRaltone at Good Acres for five years, premixing it, and allowing the herd free access to it. We find MinRaltone helps keep our herd in top-notch condition."

What MinRaltone will do for one breed, it will do for all. Follow the lead of successful dairymen—feed MinRaltone to your herd. MinRaltone protects against Hidden Hunger* because it contains 11 essential mineral elements with Vitamin D. Write for free MinRaltone feeding booklet and complete details.

WEDNESDAY, AUGUST 30

150 Registered Holstein Cattle

T. B. Accredited, blood tested, majority calf-hood vaccinated, mastitis tested, all sold subject to examination and to be as represented.

105 Fresh and Close Springers, many with good records; 20 Service Age Bulls, all from high producing dams, majority from 500 lb. to 800 lb. fat record dams; 25 heifer calves, with high producing ancestry.

50 leading breeders of Eastern United States consign choice animals to this, America's oldest established Registered Holstein sale series, where you always buy more value for less money.

Sale starts at 10:00 A. M. promptly

R. AUSTIN BACKUS, MEXICO, NEW YORK.

Sales Manager & Auctioneer

THE OLDEST LIVING "PIONEER"

Betty, owned by Mr. and Mrs. Raymond Albrechtsen of Ray Lou Farm of Ithaca, N. Y., is a grade Holstein with an actual life-time record in eight lactations and 147 days of the ninth of 100,300 lbs. of milk testing 3.3%, and 3,375 lbs. of fat.

Today there are thousands of grade Holsteins sired through artificial insemination that produce as well or better. But Betty's distinction is that she is the oldest living "Artificial" cow in New York State. She was born August 27, 1939, sired by Clover Heights Don Segis Fobes 690781, the first bull to be used in New York State's oldest artificial breeding association, the Pioneer Association.

Betty is reported as "a disappointing two year old but one who continued to improve until last year she made 14,730 lbs. of milk and 473 lbs. of fat."

For Classes and Careers

By MABEL HEBEL

YOU'LL find a wide range of new-looking materials to choose from in making back-to-school, on-to-college or career clothes this fall. Even the established fabrics have a new look. In tartans — always basic to the school season — unfamiliar clan plaids are newest, emphasizing dark, rich colors. Flannel is fashionable, especially in charcoal gray and oxford brown. Tweeds, smooth or textured, come through with flying colors, often teaming bright plum-to-violet tones with black. The "velvet touch" is in vogue, too, giving feminine touches to tweeds and a dash of color to flannels.

For the grown-up look all little girls love, there's three-piece ensemble No. 2210. The pleated jumper and button-up jacket are the perfect choice for velvet and check combinations. A companion blouse comes with this set.

College and career girls want a versatile wardrobe! With double breasted weskit and two blouse versions, No. 2250 is both fun and inexpensive to make, in a broad assortment of fabrics.

Classroom casual No. 2225 is a drop-shoulder style with comfortably full skirt. Favored for the timely featherweight tweeds and worsteds.

The mix-match idea—featured in No. 2024—is another easy way to stretch a wardrobe. Try the cardigan style two-piece in flannel, the jerkin in clan plaid or black and white check.

Autumn's top story is the short coat that goes everywhere, over everything. Topper No. 2242 in two lengths, has all the style points! It's cuffed, it's flared, and it takes well to camel's hair, bold plaids, tweeds, or sturdy, weighty woolens.

No. 2009, the all-important jumper, is basque-styled with big pockets, equally smart in flannel or corduroy. Its tie-collar blouse is for the new striped shirting.

No. 2185 is a dress that serves for many occasions—casual or date, depending on the fabric you choose! With its fitted bodice and front-full skirt, it would be charming in very fine faille or a black and white print.

For a younger casual version make No. 2216. Panel styled with saddle pockets, it is practically perfect for tartan plaid with pique contrast.

Ensemble No. 2949 is ready to triple the interest of any young wardrobe! The flared jumper and bolero can be of sturdy corduroy, or in velveteen for a dressier version; the classic blouse, in crisp cotton.

The shirtwaist dress, neat and easy to wear, is still one of the soundest investments you could make. In No. 2248, long pleats, collar and cuff detail are a new treatment for traditional lines.

Yokes at the shoulder and hipline make No. 2095 especially nice for the dark tone cotton plaids, striped chambray, or printed broadcloth.

PATTERN SIZES AND REQUIREMENTS

No. 2210—2-8; size 4, jacket, 1½ yards 35-inch; jumper, 1½ yards 54-inch; blouse, 1½ yards 35-inch.
No. 2250—10-20; size 16, long sleeve blouse, 2½ yards 35-inch or 2½ yards 39-inch; sleeveless blouse, 1½ yards 35-inch or 39-inch; weskit, 1½ yards 54-inch.
No. 2024 — 12-20; 36-46. Size 18, skirt and jacket, 3¼ yards 54-inch; the jerkin, 1½ yards 54-inch.
No. 2225—9-17; size 13, 3 yards 54-inch.
No. 2242—9-17; size 13, long sleeves, 3 yards 54-inch; shorter length with three-quarter sleeves, 2¼ yards 54-inch.

No. 2009 — 10-20; size 16, jumper, 2½ yards 54-inch; blouse, 2¼ yards 35-inch or 2¼ yards 39-inch.
No. 2185—11-19; size 13, 3½ yards 39-inch.
No. 2216—6-14; size 8, 1½ yards 54-inch, with ¾ yard 35-inch contrasting.
No. 2949 — 2-8; size 4, jacket and jumper, 2½ yards 35-inch or 1½ yards 54-inch; blouse, 1½ yards 35-inch. Applique included.
No. 2095—2-8; size 4, 2 yards 35-inch or 1½ yards 54-inch, with ¾ yard 35-inch contrasting.
No. 2248—10-20; 36-40. Size 16, 3½ yards 54-inch or 4¾ yards 39-inch.

TO ORDER THESE PATTERNS: Write your name, address, pattern number and size clearly. Enclose 10 cents (in coins) for each pattern ordered. Add 20 cents for our new Fall & Winter Fashion Book which has attractive pattern designs for all ages, all sizes, all occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, New York.

Procter & Gamble's great new discovery!

cheer®

So good you get the cleanest possible wash with the least possible work!

Try **cheer**
once...and you'll
cheer
forever!

SO GOOD it washes clothes cleaner in **ONE** wash than any soap will in two!

After years of experimenting, Procter & Gamble laboratories have discovered a *whale* of a washing product—so good that laboratory tests show it gets clothes cleaner in a single wash than any soap will in two!

SO GOOD you can get a bright, clean wash

even
**WITHOUT
RINSING!**

CHEER gives you the cleanest possible wash any "no rinse" suds can offer! Just wash, wring out and hang up to dry! . . . But if you rinse, CHEER's your best bet for a cleaner wash than you'll get with any soap —any other type of washing product.

So good you get a dazzling-white wash with **NO BLEACHING!**
NO BLUING!

Without bleaching, without bluing —CHEER washes white things clean as fresh snow, colored things bright as new paint. Yet CHEER is kind to hands, safe for washable colors.

So good you get a film-free wash *even in* **HARDEST WATER!**

CHEER suds come up thick and fast in water so hard the best soaps known play out. Leaves no sticky scum —but removes the cloudy film left on clothes by soap. **NO WATER SOFTENER NEEDED!**

So good you get a whistle-clean wash *even WHEN HOT WATER RUNS LOW!*

The hotter the water, the better the wash. But when the hot water runs low, CHEER suds stand up and go on fighting dirt. Whatever the temperature, CHEER will give you a cleaner wash than any soap, at the same temperature!

Vegetables At Their Best

By Anna Rogers Willman

IF VEGETABLES aren't too popular at your house, better check up on your cooking technique. Maybe you're not treating them right! They are so important in keeping the body fit and in giving variety and color to meals that it's worth "babying" them a bit.

Vegetables will come to the table at their best if you follow these simple rules in preparing them:

1. Use as soon as possible after gathering or purchasing. If they must be stored, place in covered container in refrigerator or in some other cold place.
2. Use as little water as possible. Only two to four tablespoons of water should be left at the end of cooking. If you use a glass cover, it is easy to see when the pan is about to boil dry. Some persons prefer the mild flavor obtained by cooking the strong flavored vegetables (cabbage and its relations, and onions) in a large amount of water, even though more food value may be lost.
3. Have the water boiling when the vegetable is added. Add the vegetable to the water, not the water to the vegetable.
4. Bring the water back to the boiling point as quickly as possible after the vegetable is added; then reduce the heat.
5. Add the salt to the water, or when the vegetables are partially cooked.
6. Pare thinly; cook in skins when possible, to decrease vitamin and mineral losses in water.
7. Do not add soda. It may destroy some of the vitamins and soften the vegetables so that they become mushy in texture.
8. Cook with the cover on or off the pan. For cabbage, onions and some of the green vegetables, the flavor and color may be better if the cover is left off.
9. Cook for as short a time as possible. The vegetables should be tender, but still firm. Cooking time will vary with the age and size of the vegetable. The cooking time may be shortened by cutting the vegetables into small pieces, but this exposes a larger surface area to the dissolving action of the water, so that the loss of vitamins and minerals may be increased.
10. Serve the vegetable as soon as it is done. Most people prefer vegetables simply cooked and served hot with butter or cream.
11. Save the cooking water to use in gravy, sauces, soups, and vegetable juice cocktails.

Baking a vegetable in its skin preserves most of its food value. Onions, squash and potatoes are especially good cooked this way. Carrots, beets and other vegetables may be placed in a baking dish with salt, butter and a very little water, covered and baked. The oven should be hot when the vegetable is put in, and the baking time should be only long enough for it to become tender but remain firm.

When steaming vegetables, be sure

the entire steamer is hot and the upper compartment filled with steam when the vegetable is put into it. More than one vegetable may be steamed at the same time. Each vegetable may be put into a tinfoil "basket" (a piece of tinfoil with the ends brought up and the top left open), seasoned and placed in the steamer. Care should be taken that the vegetables are of a variety or size to cook in about the same time.

Pressure saucepans are very satisfactory for cooking vegetables which require long cooking by other methods. Particular care should be taken not to overcook the vegetable, and not to use excess water.

If you have trouble keeping your beets or red cabbage a good color, try adding a little acid, such as sour apples or vinegar. This helps to keep the color red, and makes a good flavor combination.

These are called French carrots simply because the recipe came from a French woman:

FRENCH CARROTS

- 3 tablespoons butter
- 1 cup onion rings (may be green onions cut well into the tops)
- 3 cups sliced carrots, or carrot strips
- 1 teaspoon salt
- 1/4 teaspoon pepper
- 2 tablespoons boiling water

Melt the butter in a heavy saucepan or skillet. Add the onion rings and cook

SONG IN HOMESPUN

By Eleanor A. Chaffee

Men go east and men go west
With longing in their eyes,
But I am well content to stay
Under these quiet skies
To count the blessings that I have:
Few, and yet doubly dear,
Since each familiar sight takes on
A glory with you here.

The sun like wine along the floor,
The flowers in crystal glass,
A table laid for early tea,
Your shadow on the grass,
Are all my universe. I watch
The whole world traveling far,
And envy none horizons strange,
For I am where you are.

until light brown, stirring frequently. Add the carrots, seasonings, and water. Cover and cook until the carrots are tender. Serve at once. Serves 6.

In planning your meals, try to include every day:

One or more servings of green, yellow or leafy vegetables. (They contain vitamin A. Thin, dark green leaves always are high in iron and vitamin C, but to get the vitamin C the leaves must be eaten raw or cooked for a very short time.)

One or more servings of other vegetables.

One or more servings of potatoes. Some raw vegetables.

There Are Always Birthdays!

By RUBY PRICE WEEKS

MOST of the young mothers today start celebrating their children's birthdays when they're but one year old. The youngsters of today — when grown — should have very wonderful memories of their birthdays through the years, judging from the number and type we see given around us constantly. But since birthday parties come rather often, it's best to keep them all very simple, especially if there are many children in the family.

During the summer it is much easier for the person in charge and more fun for the youngsters if parties are out of doors, either on the porch or in the yard or in both places.

Many mothers who formerly invited the mothers of the children to the parties find it better no longer to include them but to plan to have them get the little folks home safely after the party.

It is not difficult entertaining small children but a person should have some one to help run the party successfully, both as to games and refreshments. If the youngster's Dad is free that day, he should be the one to help, as it will give him an opportunity to know what sort of playmates his child has. Children never tire of Hide-and-Seek, pinning a tail on a donkey or some other animal, and hunting for something, either peanuts, jelly beans or a thimble. If Dad isn't available for this party, ask a friend who is good with children — perhaps someone who has had nursery school or kindergarten experience. She would be invaluable.

If possible, seat all the children at one large table. On it use a paper cloth and napkins with birthday decorations and an attractive arrangement of flowers. A bright colored toy sprinkling can filled with garden flowers would be cute. Colored paper plates and dishes for ice cream and plastic forks and spoons will add to the gay appearance of the table, besides reducing dishwashing!

For favors have little paper hats at each place and a small paper nut cup

Blowing out the candles and cutting through the cake for the first piece—these are important birthday party privileges!

filled with jelly beans and an animal cracker on top.

Have a grand march to the table, with perhaps a new child in the neighborhood leading it. A piano, radio or victrola may furnish the music for this.

Place the birthday cake in front of the child who is to blow out the candles, and let him or her cut through the cake for the first piece. The little girl in the picture had three tiny pink candles matching the icing on the cake. On the top layer was a kitten playing with a ball of yarn which had started to unroll. Both the kitten and yarn were of chocolate, so every bit of it could be eaten.

It is always interesting to have pictures of these parties each year and fun to look back and compare them. This is easy to do if the pictures are pasted in a book and the date printed under them as soon as finished. A nice gift for a child is a book for this purpose with his or her name on the front in gold lettering.

Mending done out of doors does not seem half so tedious.

Mending Memos

By LOUISE PRICE BELL

MENDING is the chore that a housewife seems to dislike most. It is so easy to let it "pile up," and this makes it harder than ever to get it done. But if you get your sewing box and your supplies in order, you will be a little more willing to tackle the job.

Probably, in most homes, the socks and stockings come first. Ever try cutting off the tops of worn-out socks and silk stockings? For better darning, unravel the thread and wind onto spools. The thread in the tops is strong, and you will eventually have a variety of colors.

If your children wear colored socks, buy embroidery cotton to match when you buy the socks; then you'll be sure of having just what you need when you need it. And if the darned place in the sock or stocking shows above the heel of the shoes, take a tuck at the bottom of the heel to lower the darn. Be sure it isn't bulky. Nothing could be more uncomfortable!

Time Savers

To save time and patience, in your spare (?) time thread a number of fine and coarse needles with fine and coarse black and white thread. Also, fill two sewing machine bobbins with black and white thread. Then when sewing or mending needs to be done in a hurry, the thread is ready.

For other emergency mending, keep a roll of Scotch tape and a small pincushion in your dresser drawer. If your hem rips at a crucial moment when you can't stop to mend it, simply fasten it up temporarily with a piece of Scotch tape, and mend it permanently at your leisure. The Scotch tape doesn't harm the fabric, and it is easily removed. In the little pincushion, keep an assortment of needles threaded in different colors. If your stocking runs or your strap breaks, you have all the equipment ready to meet the emergency.

Mending tape is certainly a boon to the mender. Keep the tape and scissors nearby when you start the ironing. If you find a tear, just cut a piece of the same color tape a little larger than the hole and press on. Everything is then ready to put away. And your turned shirt collars will wear longer and look neater if a strip of the press-on mending tape is applied to the frayed part of the collar before it is replaced in the collar band. If the shirts are worn-out, you can save the collars and cuffs to use in your own dress collars and sleeves. They will give a really professional look, and they wash beautifully.

If there are children in your family, your mending table probably looks mountainous. If Freddie's overalls

wear out at the knees (and they usually do), don't use an ordinary patch. He will love the little bunny or apple patch that you cut out to fill the gap. Sew it on with gay thread and use the buttonhole stitch. And doesn't little Linda seem to outgrow her dresses even before you've put on the finishing touches? When you have to let the hems down, sew contrasting rick-rack along the line that was formerly the bottom of the hem. It looks well, and effectively covers the worn line without anyone knowing that it is being used for anything other than trimming.

Leather Patches

Leather patches are quite difficult to sew on. Simplify everything by making perforations around the edges on the sewing machine with an unthreaded needle. Then use the blanket stitch. Or if you want an edging on heavy, closely woven material like pillow tubing, use your sewing machine to punch the holes and to insure a neat, even line for crocheting. Again use the unthreaded needle and adjust the length of the machine stitch. The holes will be large enough for the crochet hook to slip into and out of easily.

Always remind the men in your family to buy trousers that are longer than necessary, and then have them bring home the pieces that are cut off. When a snap or tear occurs, you will have material to patch them in the least conspicuous way.

Get out that pair of gloves with the hole in the fingertip that you have been trying to ignore. Just slip a thimble into the finger with the hole and start mending—now wasn't that easy? If you're fortunate enough to have a fur coat (even though it is aged and beginning to break easily), loosen the lining at the bottom, take a wet cloth and dampen the flesh side of fur around the rent. When pliable, whip together with needle and thread. If it's very tender, add a piece of adhesive tape across the mend to hold it firmly.

The Easy Way

You can also use the sewing machine to overcast seams. Hold up the presser foot slightly with the right hand, run the machine at a steady, moderate speed, and gently push the seam back and forth in a zig-zag line with the left hand. With just a little practice, you can do the job in a fraction of the time that it takes by hand.

Towels and linens are so expensive these days. But even so, always try to buy two towels or wash cloths of the same size and color. And then when they wear thin, sew the two together around the edges and stitch through the center both ways. This way you will get longer service.

You can make more Grape Jelly faster with **CERTO!**

You get an average of 50% more glasses of Grape Jelly—for with Certo's one-minute boil precious juices don't boil away! Certo is a highly concentrated pectin product, and pectin is the natural "jellying" substance in fruits. With Certo, fruits keep their natural flavor, fragrance, and color... *taste that much better*, look prettier! Over 80 grand recipes with every bottle.

Here's the best way to make GRAPE JELLY

4 cups (2 lbs.) juice
7 cups (3 lbs.) sugar
½ bottle Certo

To prepare juice. Stem about 3 lbs. ripe grapes. Crush thoroughly. Add ½ cup water, bring to a boil, and simmer, covered, 10 mins. Place in jelly cloth and squeeze out juice. Measure 4 cups into large saucepan. For tight-skinned grapes, see recipe

booklet with each Certo bottle.
To make jelly. Add sugar to juice in saucepan and mix well. Place over high heat and bring to a boil, stirring constantly. At once stir in Certo. Then bring to a full rolling boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, pour into glasses. Paraffin at once. Makes about ten 6-ounce glasses.

There's magic in the word

A Product of General Foods

THE YOUTH'S COMPANION

BOSTON, THURSDAY, JUNE 13, 1895

Like thousands of other young people, my brothers and I sort of grew up on the Youth's Companion stories. Best of all of these were those about the Old Squire's farm down in Maine, written by C. A. Stephens.

As our readers know, we have been reprinting stories from the Youth's Companion, including so many of those written by Mr. Stephens that we have used up about all of them. A short time ago Mr. W. C. Witte of Trenton, New Jersey, sent me a letter written to him by Mr. Stephens in answer to a question as to whether or not the Old Squire's stories all were true. I have often wondered about this, so below is the answer in Mr. Stephens' letter.—E. R. E.

"The Laboratory"
Norway Lake, Maine
July 5th/17

Dear Mr. Witte:

Your very kind note reached me at Boston recently; it gave me great pleasure to know you have enjoyed my "Old Farm Stories." I'm still writing them for the Y. Companion, so you'll doubtless find others to follow those you are good enough to remark.

You inquire if my stories are "founded on fact" and I reply that they are nearly always quite so, altho' their dialogues may sometimes be somewhat changed in the writing.

There are two books entitled "When Life Was Young" and "A Great Year of Our Lives," published at The Old Squire's Bookstore at Norway Lake, which contain many incidents which transpired at the old farm in Maine and about which I have woven stories.

Again let me thank you warmly for your friendly letter and believe me, dear Mr. Witte, yours cordially

—C. A. Stephens.

A Blighted Expedition

Adventures of Two Boys who were looking for an Indian Battle-field

By C. A. Stephens

THE SANDY north shore of Lovewell's Pond, in the town of Fryeburg, Maine, is one of the historic battle-fields of New England, for there the white rangers, under Capt. John Lovewell, defeated the Pequawket Indians under their great chief, Paugus. From hearing the story often, Halsted Upham and I, when we were boys about fourteen years old, greatly desired to see the battle-ground; so we laid plans to drive there, a distance of thirty-eight miles, and succeeded in getting leave from our parents.

The two dollars which we engaged to pay a neighbor named Burnham for the use of his horse, "Old Ced," and wagon reduced our united capital to seventy-two cents, which we thought sufficient for the venture, as we could carry a box of cooked food. We meant to pass the two nights away from home under a buffalo-skin in the bottom of the wagon body. As it was July, the season of good grazing, we depended on the horse being able to get his living by his teeth.

I do not expect the world ever to look rosier than it did on the morning we set off, bubbling with happiness. Three whole days, all our own, a horse to drive, and we were going to see where Paugus and Lovewell fought! No boy enjoys a holiday more than an American farmer's boy—he gets so few of them! Halsted and I could safely count on but four a year, and bad weather sometimes spoiled one or more of these.

Five o'clock of a lovely summer morning saw us on our way. The route led first across the Crooked River Plains, thence into the town of Harrison, and by nine o'clock that morning we had reached a branch road diverging to the south, up a long, steep hill. Here a guide-post displayed the words, "Summit Spring."

"We ought to go up to Summit Spring," said Halsted. "I should like to see how it looks. They say there is a big stream of nice cold water coming right out of the top of the hill."

"Let's go," I said; for we had heard a great deal about the cures wrought by its waters.

"But we only hired Old Ced to go to Lovewell's Pond and back," said Halsted, doubtfully. "I don't suppose that would mean to go off our road up the hill."

As the hill looked long and hard, I thought that we had better hitch the horse at the foot of it and walk up. So we left our horse and wagon at a set of bars opening into a field from the cross-road, after we had driven about one hundred yards from the main road.

The hill proved so long and tiresome that we were thirsty enough to enjoy a copious draught from the spring when we reached it. Then, after resting and enjoying the grand view for a few minutes, we went back down the hill at a trot. But on drawing near the place where we had left our wagon, Halsted stopped short.

"Where's Old Ced?" he exclaimed, for the horse and wagon were missing. Evidently the wagon had been back-

ed across the wheel ruts and turned. In consternation we traced the marks of the wheels back to the main road, and found that the horse had been driven toward a village called Harrison Flat, two or three miles distant.

A woman and a boy whom we met told us of a horse and wagon like ours that had gone along the road, driven by a man. So we set off at a run in chase, and soon met several teams, after which we were unable to follow the tracks with anything like certainty.

We asked nearly every one we met about a light red horse with a white hind foot and a brown wagon with yellow stripes, but no one seemed to have seen precisely such a horse and wagon. At the village a storekeeper advised us to procure the services of a sheriff, but we learned he lived ten miles distant.

Halsted still thought that he could distinguish Old Ced's hoofprints along the road, in sandy places; so we followed these tracks out of the village and along a country highway which led southward through the town of Harrison. For four or five miles we hurried on through the hot day, and we became very tired and sweaty.

Our box of food had disappeared with the horse and wagon, but in the afternoon we called at a farmhouse and bought a quart of milk, a dozen doughnuts and a piece of cheese for eighteen cents. Occasionally, from those we questioned, we would hear something which kept us hoping to overtake our horse; but as night came on we grew discouraged.

"I wish we were at home," Halsted said, wearily.

"But what should we tell Mr. Burnham?" said I.

"We ought never to have left the horse there alone in a strange place," Halsted remarked, with bitterness.

"Yes, we can tell him that," I said, angrily, since it had been my proposal to leave the horse at the foot of the hill. Then we came near quarreling, for we both felt very "blue."

Though evening approached, dark and moonless, we agreed to keep on until we should come to another district schoolhouse—we had passed eight that day—and then try to creep inside and pass the night under shelter, away from the mosquitoes. Small country schoolhouses, even if locked, often have a back window which can be raised; nor is it usually deemed a criminal trespass for a boy to enter thus without permission.

We plodded on in the dark for about a mile, to a small, dark building standing beside the highway, and there we saw some indistinct object near the yard fence.

"Why, that's a horse and wagon!" whispered Halsted. "There's somebody here."

Just then we saw a light struck inside the schoolhouse and heard low voices. Figures could be seen moving within stealthily, so we fancied, which led us to peep in at the uncurtained windows. Halsted afterward asserted that he saw three boys, nearly men grown; but I saw only two moving about, with a kerosene lantern, from desk to desk, taking up and examining what looked like books.

We were about drawing back from the window, when we heard one of them say to the others, "I hope there won't anybody go by and see that hoss."

"You don't suppose they're the chaps that stole our horse, do you?" Halsted whispered.

"What!" said I. "Then this horse here is Old Ced."

"Let's we see," whispered Halsted, in growing excitement.

"It's so dark we can't see," I said.

"Well, we can feel, then," said he.

We hastily approached the team; Halsted began passing his hands over the horse; I felt the wagon. It was just such a wagon-body as Mr. Burnham's; and the whip and seat-cushion felt similar.

"I tell you this is Old Ced," Halsted kept whispering to me.

"Can you make out his white foot?" I asked.

"Yes, sir-ee, I'm pretty sure his off hind foot's got a white stocking. He's about the same height and build, too. And the D's on the saddle are like ours, too," Halsted continued, feeling the harness over; "and the splices feel like ours. Now what's best to do?"

"They are bigger than we are," said I. "They will knock our heads off."

"But they sha'n't have our team!" exclaimed Halsted. "We have got to get it away from them."

"Perhaps we can drive off before they can get out to stop us," said I. "Unhitch the halter, and we will back and turn as still as we can."

"It's our rope halter, fast enough," said Halsted, passing it to my hands. I put it in the wagon. We then slowly backed so as to turn the wagon, but the wheel scraped on the chafe iron,

(Continued on Opposite Page)

SLIM AND SPUD

Pincher Gets the Works

CONT.

(Continued from Opposite Page)

and in a moment one of the young fellows inside came to the door.

"Whoa, there!" said he.

Halsted and I jumped into the wagon; he picked up the reins, and I grabbed the whip.

"Who's there?" shouted the fellow in the door. "What are you doing there?"

Halsted shook the reins, and I laid on the whip vigorously. We heard the fellow and his confederates shouting after us, and I think that they gave chase; but we drove off at a great rate, and soon left them behind.

It began to rain about that time; but we drove on for five or six miles in dense darkness, making several turns, and heading on a generally southerly course, that we thought might eventually take us into the town of Fryeburg. Then the rain poured so violently that we took refuge under a row of horse-sheds beside a meeting-house near a small village.

We were very wet, and sat still in the wagon for a time; but we were also much fatigued, and soon became sleepy. Halsted began feeling around for the old buffalo skin and blanket which we had brought for a bed, but I had already curled down in front of the wagon-seat with my head partially resting on the seat-cushion.

A dog, barking close beside the wagon, waked me in broad daylight. Halsted was still soundly asleep, snoring painfully, with one leg hanging out of the wagon. The old horse still stood in the shafts, but to my horror, he was a black horse!

My brain seemed to turn in a queer

way, as I stared at his color. He was black as a crow; no amount of staring made a red horse of him. I bent forward over the dashboard to see if his white foot was there. He had no white foot! Then I looked at the whole wagon. The wagon was a green one, instead of brown, with yellow stripes.

I could hardly believe my eyes, and shook Halsted to reassure myself. He yawned painfully.

"Look at Old Ced!" I exclaimed.

Halsted looked sleepily over the dashboard, and then his eyes opened wide. Then he, too, thought of the white foot and looked over the dashboard.

"Why, this ain't our horse!" he exclaimed, with a most confused expression.

"Nor our wagon!" said I.

"Great Keezar!" he said, slowly. "We've taken a horse and wagon that don't belong to us! I thought last night this horse didn't drive just like Old Ced, but I thought 'twas 'cause he was tired, and when I didn't find the buffalo skin in the wagon-box last night, I thought those scamps had lost it. And I thought of course they had eaten up our victuals."

"We'll be taken for horse-thieves," said I, with a wild notion of leaving the team there under the shed and running away. But we soon saw there was but one proper thing to do.

"We must put back with this team as fast as we can, and try to find out whose it is," said Halsted, and I agreed with him.

We backed the black horse out of the shed, but had scarcely reached the road

when we saw men and boys running toward us from all sides and shouting, "There they are! There they are! Catch 'em! Stop 'em!"

In much alarm we stopped, and soon the excited crowd pulled us to a tavern. Some said, "Tie them!" Some said, "Bring handcuffs!"

They said we had stolen the horse and wagon of a farmer named Welcome, who had already come to the village that morning in quest of his property, but had passed the meeting-house sheds without seeing us there.

The state prison seemed to loom up before us, but at length several of the older men began asking us questions. Recovering from our terror a little, we told them who we were and all our story.

Gradually the excitement calmed down. Some began to laugh, and one man who had been asking us questions, said to Welcome, "I don't believe you had better get warrants for these boys. I guess they meant all right."

Welcome did not prove very vindictive, since he had recovered his horse and wagon uninjured, and he finally became so much mollified as to ask us to ride with him on our way back to Harrison Flat. For Halsted and I now thought chiefly of going home. Lovewell's Pond had quite lost its charm, especially as Mr. Welcome advised us to go home and have our folks employ the sheriff to search for our lost team.

We trudged on foot from Welcome's farm through Harrison Flat, till near Summit Spring, when we met a little girl who looked at us curiously.

"Are you the two boys that lost your

horse and wagon?" said she.

"Yes. Do you know where they are?"

"Snafie Jillson took it while you was gone up the hill," said she, "and drove away over to his uncle's in Waterford. But his uncle's folks brought it back last night and left it here at Mr. Sandford's. They have been trying to find you."

Halsted and I were overjoyed at these tidings, but declared that we would fix Snafie Jillson for the trick.

"But he don't know any better," said the little girl, in an apologetic tone.

"What's the reason he doesn't?" cried Halsted.

"Why he is a—he isn't bright, you know," replied the little girl.

We made haste to Mr. Sandford's farm, and found our team in the barn there. The people sympathized with us, but appeared to look upon Snafie Jillson as a kind of providential affliction which had to be endured with the best grace possible. We did not see him, his home being at some little distance, but we always remembered him feelingly.

As the second of our three days was now nearly spent, we gave up the trip to Lovewell's Pond, and returned home that evening. In consideration of our troubles, Mr. Burnham reduced his bill for horse-hire from two dollars to one. Yet he did not know all our troubles, for Halsted and I suppressed mention of our adventure with the black horse and green wagon.

We might better have given an ungarbled version, however, for a tin-peddler came through the town of Harrison, a few days later, and gave a full account of our exploit to our families.

An American Farmer Looks at Europe

(Continued from Page 1)

American delegation kept hammering home the need to have work done where it could be done the cheapest and to let trade flow more freely between all these small countries.

Finland

When Russia took over a great section of the most productive agricultural land in Finland, it forced 400,000 Finns off their land. Great reclamation projects, in which the government is clearing forest and rock, are under way in an effort to re-establish these people. Taxes are really high.

The European farmer usually starts his day about 7:00 a.m., takes about half an hour for breakfast, then another half hour about 10:00 o'clock for a bite to eat, a good full hour at noon, another pause for refreshments in the middle of the afternoon, and manages to get all through work for the day by 5:00 o'clock. These mid-morning and mid-afternoon refreshments in Scandinavian countries and in Germany always include coffee, but in France and Italy it is wine, and the English, of course, have their tea.

They all seem to have the idea that if Americans could take life a little easier and take time out for festivals, there would be a better balance of trade throughout the world as American farm production would not be so high and we would be able to trade with western Europe for some of their farm produce. As an American I cannot agree with the philosophy of this, but it is the way they all seem to feel.

England

Most of my time in England was spent in Kent County near the south-east coast where the mild climate gives them wonderful productivity. Few barns are required for the cattle or sheep, and at one place I saw a combine milker and cooler mounted on a truck which towed 6 milking stanchions on wheels behind it. It was driven to the pasture and instead of having to clean his barn the farmer just moved the stanchions to a new spot.

They were digging potatoes in Kent County at the rate of about 200 bushels

to the acre. The seed had been sprouted in boxes and planted by hand, and yielded tubers that would be all seconds by our standards. The farmer got a government set price of \$2.80 a bushel.

Most produce prices in England are set by the government two years in advance to permit farmers to make long-term plans. Both the consumer and farmer are heavily subsidized. The prices farmers are getting are higher than they ever got before, but more than one man told me it means nothing, and in some cases taxes more than offset the gain. Speaking of the Brannan Plan, one farmer told me: "For God's sake, don't get tied up with subsidies. We are tied up in the mess and can't let go. Oh, for the old days when we were our own bosses. If my ancestors knew what was going on they would turn over in their graves."

Marshall Plan

In England and the Scandinavian countries the farmers live on their farms much the same as we do. However in Germany, France and Italy most of the farmers live and keep their stock in villages, but their land is up to five miles away. Here we were under the auspices of the Economic Cooperation Administration (Marshall Plan) and were shown what our money is doing. As far as we could see it was being used wisely, to get industry and agriculture back on their feet. I was much impressed by the fine type of men we have over there handling the program for agriculture.

France

French farmers are especially pleased with the wonderful results they are getting with the hybrid corn being developed for them through American assistance. France was harvesting an abundance of crops in July. In fact, they were definitely worried about surpluses. Not much of the dairy products are used in milk form in France, and it is just as well, for I was appalled that in both France and Italy no TB testing is done and there is very little pasteurization of milk.

Because I am interested in poultry, I was upset to see that in neither France nor Italy is any money available for poultry research. You couldn't buy a bag of mixed poultry ration over there if you wanted to. Most orders to French hatcheries are from a half dozen to a maximum of 150 chicks. They are brooded under hens. I saw no modern equipment on any of the farms we visited, but I did see women glean- ing the fields.

Germany

We were in the Western Zone of Germany—the Russians have the Eastern Zone which is called the "bread basket" of Germany—so all we saw were farms divided into small units, so uneconomical to operate. I was on one farm that was originally 280 acres, but after many years of division and subdivision among succeeding generations, it now consists of 500 different plots of land. It is not unusual to see a quarter acre of alfalfa. The area looks like a bunch of backyard gardens all over the countryside. Some E.C.A. funds are being used in an effort to consolidate these small pieces into more efficient units. Some of the present ones are working milch cows which is not as inefficient as you might think because on all these small plots they figure they can use a milch cow to work and they can milk her and finally eat her.

I talked with truck drivers on the overnight haul to Berlin, and to one man who had spent several years in Moscow. From what I hear, Russia is a war nation. Men are either policemen, truck drivers or soldiers. The women seem to do everything else. They re-

pair the streets, mix concrete, do the actual construction work on new buildings and every kind of manual work. They are shabby and poor.

Italy

Arriving in Italy in a modern airplane, it was quite a jolt that the first thing I saw after leaving the airfield was four oxen pulling a 40-year-old McCormick-Deering binder, and then in the very next field to see five women cutting a 10-acre field of wheat with hand sickles.

The north of Italy is definitely farther advanced and more progressive as far as farming is concerned. It was in the northern part that much E.C.A. money was used to drain swamps and alleviate annual fever epidemics. The swamp draining, plus annual countryside spraying of DDT, has in four years practically wiped out the fever, and the Italians are truly thankful.

The south of Italy was the only place I saw on the whole trip where people obviously didn't have enough of their own food.

We found fine farm organizations in all the countries we visited, and everyone seems to think we are winning the battle against Communism, except in Germany where the people seem to be playing both ends to the middle, taking what we have to offer and sitting back to see what Russia has to propose.

People don't turn to Communism when they can get a job, enough to eat and a place to live.

Everywhere we went people seemed to be well dressed and well fed, and while crowded, most of them seemed to have housing facilities, except in Germany where many fine appearing folks were making pathetic attempts to seal up old bombed-out buildings.

I came back to America with the thought that the agriculture in Denmark, Sweden and England had stayed right in the high gear it attained during the war, and that it is coming back remarkably in France, Italy and Germany; but what I saw also convinced me more than ever that we ought to be thankful for our system of government and our pioneering progressiveness—that we should get down on our knees and thank God that we were born in America.

REMEMBERED SUNSHINE

By Mildred Goff

Before the fire I warm my grateful hands
At sunshine stored in weathered, seasoned wood.

The clouds drip rain, the wind howls overhead,
The warmth and comfort of the fire are good.

And thus we store the sunshine of our days
Of happiness, as do the living trees,
Against a future time of need when we
Shall warm our hearts with treasured memories.

KERNELS, SCREENINGS and CHAFF

SUNNYGABLES NOTES

By John B. Babcock

IT'S tough work when you get caught between two good men boosting bales up into the mow, or piling two-bushel bags of wheat. If they decide to "pour it on," you're caught in the middle. It's a good deal worse, though, to be the weak link between two machines. They are tough, unsympathetic and very ruthless.

Soon after my return to Sunnygables from a city job, Jack Conner was caught between two machines. In attempting to pit his strength against a baler tongue and a tractor draw-bar, he strained himself badly.

I filled in for Jack on chores and farm work while he was laid up. It didn't take long for me to find that I was physically soft. I also found that except for old Nancy, I didn't know a single cow in Jack's purebred Brown Swiss herd. I still can't call them all by name without stooping down for an underside view.

BUSINESS END

The only way I could learn the herd fast was to memorize their udders as they went by at eye level over the elevated milking stalls. Because I had to identify them in a hurry in order to grain and milk them right, it seemed to me I should first concentrate on the part that makes the milk check. It's surprising what you can find out about a cow by studying only her udder. Now, as I am learning to call the cows by name according to markings, size and type, I'm remembering my first impression—the one I got when I knew only the udders.

My original ranking of each cow according to her udder still stands. I think if I had gone about it the other way, learning to identify the cow and then the udder, I would have been prejudiced by a pretty head, nice top line, or even color. Those things don't pay off in the milk pail.

If I ever buy cows again, I would like to arrange it so that the first thing I see is the udder. I think I'll make wiser selections, even if later, one or two turn out to have a knocked down hip or a swelled knee.

Winter Feed

A couple of weeks ago, a visitor watched us put long, second cutting hay into the mow with a long hay blower. "Well," he said, "I see that with all your experimenting, you've decided to put forage up the old way—loose, long hay."

I agreed with him that long hay had its advantages. By putting in small amounts while the stems were still a little tough we were saving leaves and there was no dust in the barn to speak of. The mow tended to sweat some, but certainly didn't heat the way chopped hay at the same moisture content would have. If it had been baled that wet, it would have molded. It is the best quality calf hay we could possibly have without artificial, heated drying in the mow.

I disagreed with the visitor, though, that we had settled on field cured long hay as the best way to put up forage. It is just one of the best ways. Farther along in the same mow is some baled

cow hay. The silo at one end of the barn is half filled with chopped green oats and finished with wilted grass. At the other end of the barn is a trench holding 250 tons of unchopped, first cutting grass silage. I am expecting all

—Photos by C. Hadley Smith

Our experimental, 50-foot elevator will reach anything from the top of a silo to the barn peak. It will handle chopped green forage, grain, ear corn, bales or bagged feed. The added reach and flexibility for use on many jobs are exciting. And as an elevating machine, it runs on a tenth of the power needed for a crop blower. Here it was used for grass silage one day, bales the next—both at heights out of reach of the conventional length elevator.

of these feeds to turn out good. And I think each will serve its purpose in a rounded winter forage program.

In the same way that we hope someone will come up with a farm program that will solve all our problems, or a world agreement that will satisfy all humanity, we keep hoping to come onto the one best way to handle forage.

From what I can see, we'll never settle on any one method. We'll improve and economize on our ways of handling and storage. We'll get away, perhaps, from over-investing in expensive handling machinery. But the day we all agree on what is the best way to handle winter feed, will be the same day that representatives of major dairy breeds agree on how the ideal cow should be bred.

Seeding in Oats

Apparently Jack caught a very good alfalfa seeding with his oats this spring. Half the oats were cut green to go in the silo. On the same field, the rest of the crop became too mature for the silo and was left for the combine. Where the oats were taken off earliest, the seeding has greened up nicely and is far ahead of the alfalfa where the grain was left for the combine.

It will be interesting this fall and next spring to see if the earlier start given the first part of the seeding will make any difference. We'll have a good comparison to report on later.

Path to the Barn

In spite of a good stone path to the barn, all of us seem to prefer walking on the soft grass next to the path when we travel between the house and barn for chores. Since I was a little boy, I can remember such paths across the lawn being thick with clover. Also, our heavily trodden strip of grass and clover seems to grow a little better than the rest of the lawn.

I have often laid this better growth to the traffic across the strip. When the dew dried off the other morning, I discovered another possible reason for the good stand where we walk. There were white streaks of superphosphate from the cow stable where we had cleaned our boots by swishing through the dewy grass. The fertilizer and manure we track along the grass path would mean something in a year's time.

It might mean more to the women folks, though, if we failed to wipe our feet on the grass and tracked it into the house.

ED'S PAGE WILL GO ON

IN reporting Ed Babcock's death in our last issue, I promised you that this page would be carried on in the true Babcock spirit.

How fortunate it is and how fitting, therefore, that we have been able to secure John Babcock, Ed's son, to write *Kernels, Screenings and Chaff* for this issue and to continue to supply a part of the material for this page in the future. You have only to read what John has written here to agree that he has the Babcock touch.

John is eminently fitted to help pick up this page where his Dad left off. For years he was associated with his father in the operation of Sunnygables, and has had long experience in writing frequently for *American Agriculturist*. More recently he has been engaged in radio work, but he will now operate Sunnygables with Jack Conner and will also be closely associated with the farms operated by

Ross Yapple and Boots Poelvoorde. We are doubly fortunate because, like his Dad, John is not only a practical farm operator and a keen observer and experimenter, but he too knows how to express his ideas in print so that they are interesting and so that you will want to read them.

T. E. Milliman, whom thousands of you know, is another writer who will be a fairly regular contributor to this page. Tom has had years of experience in farmers' cooperative organizations and operates his farm, Hayfields, at Churchville in western New York. Like Ed Babcock, he has been a pioneer both in cooperative work and on his farm, and those of you who have read his many articles over the years in *American Agriculturist* know how well he can express his ideas and experiences. Look for what Tom has to say here next time.

—E. R. Eastman

Service Bureau

By H. L. COSLINE

CONSIDER THE COST!

I ordered a set of cooking utensils which were to be shipped about June 10. I waited two weeks after that date. When they didn't come, I called the salesman and asked him to cancel the contract because they were overdue. A week later the utensils arrived. I did not accept them because I didn't have the money to pay the C.O.D. charges. Can I get back the \$35.50 down payment I made? My work has fallen off, and I find I won't be able to keep up the payments.

The Service Bureau gets many letters similar to this one. There is nothing we can do to help the subscriber. She signed a binding contract, and the company from which she bought the cooking utensils can demand payment of the entire amount. Shipment was promised "about June 10," so we do not see how the contract could be broken on the basis that shipment was three weeks late.

Before you sign a contract for any merchandise, be sure you are going to be able to make the payments. If there is any chance you won't be able to, don't sign!

— A. A. —

DEPRECIATION

I have a windstorm damage policy on my barn. After a storm, it cost me \$559.75 to put on a new roof; and now the company only want to pay half of this. Aren't they supposed to replace a roof destroyed by wind?

There is often misunderstanding in connection with such insurance. We checked with the insurance company, and were told that depreciation must be considered in making a settlement of a claim of this type. In other words, the owner of the barn cannot expect the company to replace a roof which has been in use for approximately half its estimated life. The barn owner will be allowed the estimated value of the roof at the time it was damaged—not the cost of a new one.

This seems to be standard procedure with all companies, and we consider it logical and fair.

JAIL TERM FOR CHICKEN THIEVES

Mr. and Mrs. Ambrose De Moise of South Kortright, N. Y., noticed one evening that their dogs were unusually excited. They could find no reason for their actions, but the next day they found tall grass had been

trampled down, leaving a trail to the road. They checked and found about 60 or 70 pullets missing. The State Police were notified immediately. They made a thorough investigation, and a general alarm was sent out. A few days later two men were arrested near Binghamton. They admitted that they had stolen chickens

near South Kortright, and it developed that the poultry they took belonged to Mr. and Mrs. De Moise. These young fellows, August Krus (19 years) and Frederick Krus (17 years) were sentenced to and served 60 days in the Delhi jail. Delaware County Sheriff Albert Page reported that these boys were taken from Delhi at the end of their sentences to face charges elsewhere. A reward check in the amount of \$25 has been sent to Mr. De Moise. Both he and Mrs. De Moise have our congratulations. The State Police, Sheriff Page and all other officials involved in this case deserve a lot of praise. Nothing does more to discourage such activities than arrests and convictions. Some day poultry and cattle thieves may learn to stay away from farms where American Agriculturist Service Bureau signs are posted.

Ever Lose Control?

Mr. JESSE BACON had never lost control until the day he was driving to town, on the highway near Claremont, New Hampshire. His pick-up truck suddenly hit a slippery spot in the road and went out of control.

Esther Bacon, his wife and two daughters Patricia, age 16 and Gloria, age 1 year were taken to the hospital in an ambulance. Luckily the baby escaped unharmed.

Second Tragedy

Mrs. Bacon knows better than most people about the protection of the North American, because both Mr. Bacon and her first husband were killed in a travel accident. Both carried North American policies.

When Mrs. Bacon received the check for \$1000.00 from our agent, Mr. Brush, she said, "I think the North American Accident Insurance Company is a wonderful company—everyone should have a policy."

104th NEW YORK

STATE FAIR

at Syracuse beginning Saturday, September 2, then day and night through Saturday, September 9.

AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

BIGGEST SHOW

on Earth

One Million Dollars in Prizes !

One Hundred Thousand Competitors !

Eight Million Spectators !

ADDED TOGETHER, the state, county and town fairs of the Northeast offer the biggest achievement contest in the world. At more than 300 fairs—from the great New York State Fair and the Eastern States Exposition at Springfield, Mass., to the smallest community fair—farmers, rural housewives, boys and girls will compete with neighbors to see who can grow the best crops, who can raise the finest livestock, make the best cake, and sew the finest seam.

The prize winners will share more than a million dollars, but actually this isn't what attracts all the entries. There is no "jack pot" in these contests; individual prizes average less than five dollars. There is something else that makes competition so keen. It's the magic blue ribbon that represents success of personal effort to produce something just a little better than someone else.

Fairs are a combination of attractions to farm families. A day at the fair offers a chance to visit with neighbors and old friends not seen during the busy weeks of summer; it offers relaxation in the grandstand and along the midway; and to the kids it is that one day when they can load up on hot dogs, pop and peanuts, and then for an extra quarter have them all stirred up into a dizzy mixture on one of the newfangled rides.

It gives Dad a chance to

see the newest machinery, and Mother a peek at the latest household helps, but perhaps the greatest value to the farmer is the opportunity to see what new varieties of products are walking off with the blue ribbons and what cow families are winning the championships.

Yes, it's a million dollar show going on in our own Northeast again this summer—one at which eight million of us, from city and country, will spend more than nine million dollars, but it will be worth it because, added together, our Northeast fairs are indeed "The Greatest Show on Earth."—A. J. H.

YOU JUST CAN'T BEAT G.L.F. HYBRIDS

It's Time to Order 1951 Seed Corn

RIGHT about this time of year, when corn has completed its growth and reached the dough stage, is the one time during the season when a good comparison can be made. Does your 1950 crop meet your expectations—will the ensilage be just chuck full of grain—is it standing up well so that harvesting will be easy?

While all these things can be observed and are fresh in mind, it is a good plan to make a selection of seed for the 1951 crop.

Early Order System Means More Efficient Service

When farmers tell G.L.F. what kind and approximately how much hybrid seed corn they want next spring it takes a lot of guess work out

of buying seed. This information in the fall of the year, plus the fact that the seed is moved through the already established G.L.F. service agencies, makes it possible for farmers to save thousands of dollars on their G.L.F. Hybrid Seed Corn.

Select a Corn to Fit Your Farm

The G.L.F. Hybrid Seed Corn chart showing all the varieties adapted to the growing conditions in your area is now on display at your G.L.F. service agency. Your Agent-Buyer or store manager is taking orders all during September. Now, during corn harvesting season, is the time to place your order for 1951.

Cooperative G.L.F. Exchange, Inc.,
Ithaca, New York

Use G.L.F. Hybrids . . .

There's No Better Corn at Any Price

First choice of farmers -because it's first in traction

Only SUPER-SURE-GRIPS give you all three!

1 **Wedge-Grip Action.** Note how Goodyear SUPER-SURE-GRIP lugs are set closer together at the shoulder than at the center—don't flare out as in most tires. *Result:* soil is *wedged* between SUPER-SURE-GRIP lugs, giving a stronger, firmer grip.

2 **Straight-Bar Lugs.** Because Goodyear's husky lugs are set straight as a ruler, they give you more gripping surface than lugs that toe in. *Result:* SUPER-SURE-GRIPS give you *full-lug* pull for their full length and depth — the greatest pull on earth!

3 **Self-Cleaning O-P-E-N C-E-N-T-E-R.** Only Goodyear gives you straight, even-balanced, equal-size, wedge-grip lugs — with no mud collecting connectors, hooks or knobs. *Result:* SUPER-SURE-GRIPS give deeper bite, more even pull, smoother ride, longer wear!

***That's why SUPER-SURE-GRIPS pull where other tires won't!
They make any tractor work better—yet they cost no more!***

THE EDITORIAL PAGE

BIG EVENT OF THE YEAR

I DON'T think I ever went to the New York State Fair in the years before the war when it was going full swing that it didn't make me proud of my State and the tremendous achievements of its people, particularly the farm folks. One cannot walk through the poultry and cattle buildings or through the long aisles of fruit, vegetable crop and flower exhibits without realizing that New York is a No. 1 farm state.

It is good, therefore, that under the management of Director Harold Creal, outstanding farmer and Representative of his district in the Legislature, with the help of Assistant Commissioner of Agriculture Earl Foster, we are going to have a bigger and better New York State Fair this year than ever before. No matter what your tastes are, there will be a great many exhibits and entertainment features which will appeal to you. Special emphasis has been given to the work of boys and girls; there will be an around-the-clock women's program, including one-act plays staged daily in the Women's Building; if you like horses you will see 500 trotters and pacers entered for the harness racing; if you like thrills there will be the auto races; if you are interested in equipment for the farm or the home, there'll be plenty of that to see.

Best of all will be the opportunity to meet and visit with old friends whom perhaps you haven't seen in many years. I don't know what a day or two away from the farm or from business does for you, but I have never got over the thrill that "going to the fair" meant to me in boyhood, when there were few chances for recreation on the old farm. It was a chance to break away from work and the regular routine of life, to see new things and old friends, and then come back with new inspiration to carry on the old job.

You'll miss a bet if you don't plan to attend the New York State Fair this year!

HEAVY TRUCKS, ROADS AND TAXES

ITHACA, NEW YORK, is a city of steep hills where there have been many accidents from trucks getting out of control on the hills. So one night, a week or so ago, the authorities stopped 32 trucks and found eight of them overloaded and others with loads out of balance.

This emphasizes a problem to which the public and the authorities must give attention, not only to the fact that many trucks are overloaded, but also to the unfair situation where big loaded trucks are rapidly wearing out our roads and paying far too little for the privilege.

Of course, trucks are extremely important to all of us, and especially to farmers, and the smaller trucks are paying their way. Thirty years ago our highways were ample for the weights trucks had to carry, but they got bigger and bigger, and the operators found that the bigger the load, the more profits they could make.

Today in New York State it is legal for a truck to carry almost 32 tons on our highways—63,750 pounds.

Highways and bridges strong enough, high enough, and wide enough must be built to accommodate these trucks even though they are fewer in number than the light trucks and farm trucks. These extra strong roadways needed by the heavy trucks cost New York State \$198,000 per mile to construct. This much money would improve more than 26,000 miles of our rural farm roads. Only one out of 160 vehicles in New York is a heavy truck, but they account for a quarter of the use of our roads as they pound back and forth on our pavements day and night.

Now, I say again that heavy trucks are needed and do a good job, but compare the tax costs with an automobile. It costs a passenger car driver 23c in license fee and gas tax to move 100 tons one mile,

By E. R. Eastman

but it only costs the heavy trucks 5c a mile to move the same weight. In New York State these heavy trucks pay an annual license fee of \$140, which is the third lowest in the nation. In Colorado they pay a license fee of \$2,055. At the same time a light-weight farm truck pays \$27 a year license fee in New York, which is the third highest in the nation. In Georgia a light truck fee is only \$2.50. The average in the nation is only \$15.

There is still another angle to this situation. As you know, the branch lines of railroads are going out of business almost as fast as the Public Service Commission will permit. When they do go out, the localities are faced with a much heavier tax rate. So, in addition to the loss of transportation facilities when railroad service ceases, the community also suffers a heavy tax loss. Railroads have to compete with the trucks.

Farmers need the railroads as well as the trucks. The railroads pay all sorts of taxes and meet all kinds of difficult regulations. Farmers are certainly not for any more regulation of anyone or any business, but the heavy trucks are destroying our roads and it is fair that they should pay their share of this destruction with a greatly increased license fee, and fair to other transportation facilities to put them on the same cost basis.

COMPETITION FROM WESTERN MILK

FOR SOME TIME there has been a definite drive on by dairymen and members of Congress from the Central West to bring about a uniform Federal health code for milk. Western dairymen look with envious eyes upon our higher prices for fluid milk, not realizing that one of the chief causes for the higher prices is our higher cost of milk production, caused chiefly by high grain prices, most of which grain is bought from the Central West.

When these high grain prices are mentioned, Midwest dairymen point out that they will try to enter our Eastern markets with fluid milk if we continue to press for cheaper grain.

As a matter of fact, it is becoming increasingly difficult for dairymen in any milk shed to build a fence around it. Because of faster transportation and refrigeration it is easier now to ship milk long distances.

However, if dairymen in other areas are required to meet the stiff, costly requirements that Northeastern dairymen have to meet, then it is difficult for us to argue effectively against a national health code. We do have some advantages, possibly the chief of which is that we are nearest these great fluid milk markets. Moreover, so far as grain is concerned, I have thought for a long time that a partial answer to the problem lies in Eastern dairymen growing more of their own feed, and we have already started to do that.

AT IT AGAIN

IT IS positively awful that we are plunged into another war so soon after the last one ended—if it ever really did end. One GI said to me recently, "Why, Mr. Eastman, I feel as if I had only just got back!"

There is something the matter with our civilization when, in spite of the fact that almost all the millions of people on earth intensely desire peace, it is possible for a few criminal or inefficient leaders to keep the world almost continually at war.

The draft, which is being stepped up, brings home to us the sad fact that we are in war again. Farmers and their sons will have to get it in mind that it is going to be much more difficult than in the last war for farm boys to get exemptions. The

draft boards believe that because of better use of science and equipment, less help is needed on farms to produce the necessary food, even for war. Therefore, exemptions will be rigidly screened, and some of the Selective Service Boards believe that farm boys have no more right to be exempt than any others.

If you are of draft age, the best you can do is to keep well informed and be ready with plenty of proof if you feel that you can be of more use to your country in food production than you can in the military forces.

BIG BUSINESS

AT LUNCH with my friend Monroe Babcock the other day, he told me that he has 15,000 laying birds, in addition to a good-sized hatching business. As Monroe talked so casually about such a huge poultry business, I couldn't help but remember that no longer ago than when I was a boy, a flock of from two hundred to four hundred hens was very exceptional. The average was something like fifty, and these were left largely to shift for themselves in the summer time, lay a few eggs in the spring and summer, and suffer the long winter through with little or no production.

Great pioneer leaders and scientists like Jimmy Rice are largely responsible for turning poultry-keeping from insignificant beginnings of fifty years ago into one of today's greatest farm enterprises. In this section of the Northeast, the poultry business brings in from 15 to 18 per cent of our total farm income, and it's growing all the time.

GOOD STORY

TURN to Page 8 and read the first installment of Mr. Eastman's new novel "NO DRUMS." All of us on the *American Agriculturist* staff who have read this story think it is the best one yet, and that's saying a lot, as all of you who have read Mr. Eastman's other books will agree.—A.J.H.

HEART DISEASES MOW THEM DOWN

HEART DISEASE causes more than one-third of the deaths in the United States, three times the proportion of 1910. One of the chief causes, especially farming, is over-exertion and heavy lifting.

No farmer over 50 ever ought to tail a threshing machine or climb into a hot haymow to mow away bales or loose hay, and he ought to be especially careful about heavy lifting. That is one reason why for years I have believed that feed and fertilizer should be sold in fifty-pound or at least not over seventy-five pound bags.

If you have heart trouble, don't walk against a cold wind, don't climb hills, don't over-eat, don't get mad, and above all, don't hurry.

EASTMAN'S CHESTNUT

WHEN Field Editor Jim Hall got home the other night, Emilie said to him:

"Jim, have you read *The Journal* yet?"

"No. Why?"

"Well, there's the strangest story in there. You know I've always kidded you about not having brought home some souvenirs from the war, and now I wonder if maybe you weren't right not to do it."

"What brought this on?" said Jim. "What's the story?"

"Well, up on the Danby Road, according to the newspaper, there's a young GI with a little boy about four or five years old. The father was milking and the boy was playing with a bomb that his father had brought home as a souvenir. The child threw the bomb some way, and it landed right under the cow and went off and blew the cow to smithereens."

"My gosh!" said Jim, "What happened to the farmer?"

"He was left holding the bag!"

AA's Farmers' Dollar Guide

FARMING PROFITS: Most farmers will agree that they are not farming quite as well as they know how. The same would be true for men in every industry. In these uncertain times the man who continually checks on his operations is the one whose costs are likely to be lowest. Here are a few suggestions:

1. Is your farm business large enough to be efficient and to return a good living for the entire family?

No matter how carefully you farm, the results will be unsatisfactory if you are farming on too small a scale.

2. Is your work done on time?

If not, it may be that discontinuing or reorganizing some enterprises, hiring more help, or buying more equipment may pay.

3. Do you grow high-quality products?

When poor apples are a drug on the market, consumers will pay well for the best. You cannot make poor stuff into a good product by grading.

4. Do you control diseases and insects on animals and plants?

A bad outbreak of a poultry disease which might have been prevented can put a big dent in your profits for the entire year.

5. Do you buy top-quality seed?

In these days of stiff competition the best is cheapest. Some varieties yield better than others and are resistant to certain diseases.

6. Do you use enough lime and fertilizer?

Many of us apply plant food more or less by guess. Make a check to see exactly how much you should use per acre and how it compares with your state college recommendation. Both lime and fertilizer are good buys at present prices.

7. Do you sell your produce or do you wait for a buyer to come and make you an offer?

A few cents more in your selling price can, in a tight year, double your net returns.

CROSS PURPOSES: Without looking far you can see many instances where government agencies are working against each other. For example, while government agencies were buying butter to support prices, Congress removed the tax on uncolored oleo, thus tending to decrease butter consumption still further.

While scolding hoarders, the government itself is the biggest hoarder of many food products.

While fighting bigness in industry, the government itself is our biggest industry—grown so big that it is unwieldy, top-heavy and inefficient.

While asking for more taxes, thus requiring individuals and businesses to cut budgets, government agencies are doing little or nothing to reduce government expenses of a non-defense nature.

FEDERAL BUDGET: Facing possible full-scale war, there are many ways in which government budgets can be cut. Here are a few suggestions:

1. Less non-military help to Europe. In the August 16th issue Warren Hawley reported that most European countries do not need further food gifts from us.

2. Public works can be deferred until there is a labor surplus rather than a shortage.

3. Socialistic schemes can be postponed, or better still, forgotten entirely.

4. Government agencies can be consolidated, duplication can be cut out, and many activities restricted in line with the intent of the Hoover Report.

REMINDER: It is generally believed that there will be no price supports on the 1951 potato crop, and definite statements have been made that supports on eggs might be discontinued on January 1. Full-scale war could change the picture, but without it we look for this trend to abandonment of price supports to continue. Supports as set up and administered since World War II cannot be justified. A reasonable case can be made for low level supports that would not encourage unwanted production but which would be insurance against bankruptcy to farmers in case of a depression. —H. L. Cosline.

The Song of the Lazy Farmer

AS I GROW old and lose my fire, I'm sometimes tempted to retire; when summer work is under way and there is lots to do each day, I often think how nice 'twould be if I had naught to worry me. A house in town would be a cinch 'cause chores or time would never pinch; I'd sleep as long as I desired, then take a nap when I got tired. Between winks I'd walk to the square and visit with the boys down there; no guilty conscience would plague me, my mind would be completely free because Mirandy wouldn't care a hoot 'bout what I did or where.

On second thought, perhaps I might not have it figured out quite right; a place in town needs fixin', too, there's lots of little chores to do, so I suspect Mirandy'd seek to make me work 'til I got weak. And she'd succeed, too, wouldn't she, 'cause almost any place I'd be she easily could hunt me out, where'er I was I'd hear her shout. No, I guess I had better stay out here,

where I can sneak away and find a spot across the hill where, chances are, she never will locate me 'til the work's all done, and meanwhile I'll enjoy the sun.

"For real pipe comfort, I smoke crimp cut PRINCE ALBERT,"

"Outworks them all!"

J. D. LEACH, with many years of experience in harvesting silage, farms in the rich Conneaut Lake region of northwestern Pennsylvania.

says J. D. Leach about his **NEW HOLLAND FORAGE HARVESTER**

"I've used other makes of forage harvesters for silo filling," writes this successful farmer from Espyville Station, Pennsylvania. "But believe me, this New Holland machine outworks them all! It's sturdier, more economical and has a good high capacity."

"I bought my New Holland Forage Harvester because I had such good results with my New Holland Baler. Now I can truthfully say that *both* New Holland machines do everything the advertisements say they'll do—and more!"

Only the New Holland Forage Harvester offers you all of these advantages... at no extra cost!

- **Start, stop or reverse** feeding action from tractor—prevents clogging. Deflection angle on discharge pipe controlled from tractor.
- **Discharge pipe** turns to left, right or rear without changing supports or removing pipe.
- **112 sq. in. throat opening** handles up to 6 tons of chopped dry hay... up to 20 tons of corn per hour.
- **Changes** from windrow to row crop in

- a matter of minutes.
- **Gathering chains** are self-cleaning.
- **Continuous** upper apron, crawler-type, gives positive, even feeding; prevents jamming.
- **Four-knife flywheel**—slicing, not scissor, action.
- **Eleven cutting** lengths, 1/4" to 4".
- **Blades** can be removed for sharpening without disturbing adjustment.
- **Shaker cylinder** removes small stones.

Windrow Pickup Attachment—Windrow attachment for grass, semi-cured or dry hay. Special alloy fingers lift hay gently to apron. Capacity 15 tons of green hay or 8 tons of semi-cured hay per hour.

Model 610 Power Take-Off Forage Harvester—New model forage harvester can be operated with full efficiency from tractor with power take-off of 31 h.p. or more. Cost is \$617 less. Illustrated below with row crop attachment.

Model 680 Forage Blower—New tilt-table blower has low 22" operating position. Moves up to 30 tons of chopped green hay per hour... 40 tons of silage. Wheels retract.

Apple Harvesting Problems

By E. Stuart Hubbard

President, New York State Horticultural Society

AS THE HARVEST SEASON approaches, we face many problems. Thinning has been a major operation since varieties like Melba, Milton, Wealthy, Golden and Red Delicious, Baldwin and Rome, even where sprayed with hormone after bloom, have set full and there is a scattering of off-grade apples to eliminate. Even some Cortlands can profitably be relieved of terminal, small, clustered and blemished fruits.

Ample rains have resulted in fine size for the late season with promise of such heavy loads by picking time that propping will be necessary on some trees. The next cultural detail is the use of hormone spray on McIntosh and possibly other varieties to prevent untimely dropping. This practice, like the use of the same material to cause shedding of surplus fruits early, is still in the trial stage.

Like all interferences with Nature's balances and controls, these materials cannot be used thoughtlessly and wishfully. Nature adjusts the functions of the tree to suit the conditions of moisture, heat, load, vigor, etc. McIntosh that have been damaged by worm, maggot, heat or lack of seeds normally drop before the sound, healthy apples are colored and matured. This natural thinning often is very helpful in permitting tree energy to go into the sound fruit and to increase its size and quality.

There has developed a practice by many growers of applying one and even two of these sprays before picking McIntosh. This has sometimes caused all defective, premature apples to cling and to be picked and stored with the sound, later-keeping fruits. Last year, losses due to ripening in storage of the good fruit by gases thrown off by the ripe fruits were enormous. We

have made a practice of spot picking the earliest maturing trees before applying the hormone spray or dust, thus permitting the premature apples to drop or to be picked at that time. This has resulted in larger size, better color, better flavor and later keeping quality in the main crop, with little or no loss in volume of good fruit. Evidence is accumulating that McIntosh sprayed with repeated applications of hormone, especially of double and triple strength, ripen more rapidly than those receiving less or no such sprays.

Selective Picking

Next to thinning, spot or selective picking has proved most profitable for us. By this is meant starting a few days early and removing the largest most mature apples from the outside of the tree and from early maturing trees. By this method, picking can be started earlier and continued later than when the whole crop is picked at once. Another advantage is that a pack of apples of more uniform size, color and maturity is secured, while the smaller, greener apples are given time to grow, color and mature. The cost of picking twice need be but little more per bushel, and an increase in the volume and value of the fruit much more than compensates for any added cost and trouble. It may even pay, as with Greenings and Spys, to make three pickings.

"Because we have always done things this way" is no longer a valid reason for continuing to do so. The size, color, quality and flavor demanded now are much more exacting than before, while prices for undesired fruit are ruinous. Unless we supply our public with the apples they desire, we can confidently expect to be forced out of the apple business.

Sprays Ditch Weeds on Oswego Muck

UNTIL 8 years ago John E. Zagame lived in New York City and worked on boats in the city's giant harbor. Now, as a successful muckland farmer he sees truckloads of his produce

age where he keeps his onion crop for more favorable winter prices.

In the picture (left) John is adding water to a weed-killing chemical to go after weeds in his ditches. The lightweight Allis-Chalmers tractor has a built-in high pressure rig with two 35-gallon tanks, a 6-row boom, and a hose attachment for reaching the ditches. He says it's the handiest rig he ever had for going after weeds in the muck.

—A.J.H.

CONTROLLING MICE IN ORCHARDS

IN THE July issue of *Farm Research* published by the New York Agricultural Experiment Station at Geneva, Robert Eadie gave the results of some tests in machine baiting to control orchard mice. The bait used was coarsely cracked corn which had been poisoned with zinc phosphide. A green dye was added because it was found that this had some repellent effect on birds.

The poison grain was distributed with a hand-operated garden seeder at the rate of 10 to 20 grains per foot. With this method a man can bait an orchard at the rate of 15 minutes per acre, usually distributing bait on both sides of each tree row and using 3 or 4 pounds of bait per acre.

The bait is dropped deep in the grass where mice can find it, but where birds are unlikely to do so. This can be done best before the grass mats down in the late fall. Some rather careful tests have shown that the hazard to wild life is small.

heading back to the city to help feed his old neighbors.

He has had enough experience growing 32 acres of vegetables on the Oswego County muck near Southwest Oswego, New York, to know that he might have to sow his onions one, two or even three times if the winds aren't just right in the spring but he enjoys the thrill of growing things by his own efforts. This year he had 20 acres of onions, 7 of carrots and 5 of lettuce. The carrots and lettuce are mostly sold right at the farm, but he has a big stor-

Time to Slash Your Costs at PURINA'S BIG COST-CUTTING FAIR

SAVE
ALMOST HALF
ON THIS FAMOUS
PURINA FEEDER
REGULAR \$2.60 PRICE
NOW ONLY
\$1.35
WITH EACH 500 LBS.
OF PURINA
LAYING CHOWS

PURINA

for GROWING
and LAYING
BIRDS

As you swing into fall laying season, it's time to think about stepping up egg profits... by cutting down costs. Your Purina Dealer is ready to help. He has a three-way Cost-Cutting Fair that's aimed at putting more money in your pocket every month this fall.

Start off with the big feeder deal. You can get as many of these famous all-metal hoppers as you need. Every time you buy a hundred pounds of any Purina Chow for laying hens, get a coupon worth 25¢ on a feeder. Whenever you get 5 coupons, turn them in on a feeder for \$1.35—almost one half price! Offer lasts only until Oct. 31, and is good in Continental U. S.

SAVE up to 5¢
a dozen on
feed cost

Careful records kept by 1500 folks who follow the Purina Plan show that they can produce each dozen eggs on 5 to 5½ pounds of feed. Most farmers on other rations take at least 6 to 6½ pounds to do the same job. So, many Purina feeders are saving as much as 5¢ a dozen on their eggs. Try Purina and see.

Feed Purina
High-Efficiency Laying Chows

SAVE the cost
of feeding
CULLS

Most Purina Dealers are culling hens for folks in their neighborhoods. They cull out the "quitters" that eat feed but don't lay. They help take out pullets that will not make good producers. Ask your dealer. It's part of his Cost-Cutting Service.

Ask Your Purina Dealer
to Cull Your Flock

"PRIDE OF ANCESTRY?
OR?"

All my life I've been a hunter. I was born before the days of safety pins so I don't know how my "didies" were pinned on, but I do know that I graduated from that garment right into long trousers, with sporting instinct, developing quickly into a hunter with a gun on my shoulder.

Once on an early hunt I crawled on my tummy in a cornfield and saw a meadow lark on top of a stalk. Just as I had a bead on him, he flew away, taunting me with his song, "Laziness will kill you." Try to whistle his call with these words to the music. After that admonition, how could I ever be lazy?

A book filled with stories about quail hunting, "My Health Is Better In November," by Havilah Babcock, was given me for summer reading. An old-time hunter from the deep South had this to say about bird dogs: "A good dog needs no pedigree, and if a dog ain't any good, a pedigree don't help him none. A bird dog's business is to hunt birds, ain't it? If he does that well, it don't make no difference about his ancestors. You take a mule now. He ain't got no pride o' ancestry nor hope o' posterity, but if he plows cotton all right, you don't hold it agin him because his father was a jackass, do you? When you find what you want in a dog, what's the use of pryin' into family matters, sir?"

The same old fellow, talking about a man buying a \$40.00 registered dog, said: "He done bought himself thutty dollars wuth o' papers and ten dollars wuth o' dawg."

Sometimes I confess that I seem to have a lack of enthusiasm about a man's ancestors. I feel like my hunting friend who was offered a dog: "Do you want to see his pedigree papers?" "No sir," he replied, "but I'd take it right kindly if you'd let me see your dog work the field a little first."

What do I mean by sharing these stories? Just this: that pride of ancestry may be worth \$10.00, but \$30.00 worth of ability is what makes a man in these days of great need—days when we need men of ability and character and vision.

Daringly,

WM. H. DANFORTH
Chairman of the Board
RALSTON PURINA COMPANY
St. Louis, Missouri

MARK WILSON pulled his head out of the cow's flank, stopped milking, leaned back on his stool, and gave himself up to daydreams, meantime absently rubbing the nail of his forefinger over his upper lip. He was thinking about the party he was going to that night. It was about time, he thought, that he had a little fun. Seemed as if there'd been nothing lately but work and worry. He was darn sick of the heavy work in the woods all winter, and the way he felt now he never wanted to see a cow again!

All this talk about war got a fellow down, too. What did he have to do with the slaves and States' rights? He wanted to get married, but how could he marry and then rush right off to war?

And now he had another worry. What had got into Ann lately? She was never twice the same. She didn't use to be like that. They had always got along fine without bickering as they did now all of the time. He had been sure then that Ann loved him, but now he wasn't so sure. Sometimes she was just like she used to be; then the very next time he saw her, she would be cold and distant. Maybe that was the way with females. Maybe Ann thought that was the way to keep up his interest, but it darn well wasn't. He liked his friends where he could find them and depend on them!

Mark started milking again, this time with one hand. With the other he continued to stroke his lip meditatively. Then as a thought gripped him, he stopped milking again. Come to think of it, Ann hadn't begun to be difficult until that Henry Bain started to notice her. "That's it!" he exclaimed. "That's just it!"

"What in heaven are you talking about?" demanded his father, who had come from the other end of the stable with a pail of milk. Embarrassed, Mark made no answer, and George Wilson paused to say, sternly:

"You're doing a lot of mooning around here lately. I wish you'd get your mind on your work!"

Down the line of cows where they were milking, Mark could hear his two younger brothers snickering.

"I'll kill those brats!" he muttered, angrily.

The milking done and the cows fed, George Wilson and his three sons went in to supper. On pegs by the kitchen door they hung their caps and coats, covered with cow hair and smelling not unpleasantly of the stable. Then the boys stood by while their father crossed the kitchen to wash at the big sink. After pouring some cold water from a pail into the wash basin, he handed the empty pail to Mark so that he might fill it at the pump in the yard. Then, warming the cold water in the basin with a big dipperful of hot water from the reservoir on the back of the kitchen stove, George Wilson lowered his whiskered face close to the basin and, dipping both hands into the water, thoroughly scrubbed his neck and face, making blowing noises through his hands as he scrubbed them vigorously up and down over his mouth and nostrils.

Although Mark had seen his father

go through this ritual a hundred times, it never ceased to fascinate him. After briskly drying his face on the big roller towel, George Wilson strode across the kitchen and sat down at the head of the long table. At its other end sat his wife Nancy, perched on the edge of her chair, her small figure almost obscured by the tall teapot at her right hand. In between father and mother, ranged like stairs on both sides of the table, were the family—Mark and his two brothers and three sisters. Mark was twenty; Charles, sixteen, and Tom, twelve. Ellen was ten; Elizabeth, eight, and Hattie, four.

It was April, and although the long

swered her mildly:

"I was at the post office when the stage came in from Owego today. They say the rebels have fired on Ft. Sumter. That means war!"

Making no comment but apparently to relieve her agitation, his wife jumped up from the table and began clearing off the dishes, assisted by the two older girls. George Wilson again let his glance wander worriedly over his family and then, as if all of his fifty years weighed heavily upon him, he too got up from his chair, walked slowly across the kitchen to the mantel behind the stove and began to fill his pipe from the box of tobacco he always kept there. Watching him, Mark thought:

"Even if the house was on fire, Pa would fill his pipe and get it going before he tried to put out the fire."

Then Mark went up to the bedroom under the eaves that he shared with two of his brothers and began to get ready for his party, thinking dejectedly that even his best Sunday-go-to-meeting suit wasn't much of an improvement over his old every day clothes, except perhaps it didn't reek quite so much of the cow stable. Mark didn't know when he had had a new suit, and this one had shrunk so that his long arms and legs stuck out of it, making him look like a veritable Ichabod Crane. He was

AUTHOR'S NOTE

YEARS AGO when my son George was a small boy, I got it into my head that I would like to try to tell in fiction form the story of the struggle that dairy farmers have had to get a living price for their milk. So I started to write a novel called "The Trouble Maker." But no one knows until they have tried what an infinite amount of research, study and hard work it requires to write a book, and as this was my first book I frequently got discouraged and temporarily quit working at it. Then I would go at it again because George had been reading some of the first chapters and he kept asking for more. Boys—particularly sons—never kid anybody, especially their dads, about anything, so I thought if George liked the story, maybe others would, and I kept at it until it was finished and published in serial form in *American Agriculturist*.

The response to that serial, and later when it was published in book form, was also very encouraging, so it wasn't long before I was burning the midnight oil on another book. On this page is the first instalment of my latest novel, the *sixth* serial that I have written for *American Agriculturist* and for you. I have continued to do this extra job of writing because of the hundreds of letters indicating that many of you like these stories.

The story "No Drums" has taken less research than some of the others I have written because, to a very large extent, it is written right out of the lives and personal experiences of my own immediate ancestors on both sides of the family, all of whom were farm folks. I hope you like it.—E. R. Eastman.

winter evenings were past, the darkness in the kitchen was only partly conquered by a coal oil lamp at each end of the table and the bracket lamp near the sink. Tired and hungry after their long, hard day, the first order of business with everyone was to eat. The fare was plain — boiled potatoes, salt pork, milk gravy, homemade bread, butter from the dairy, and blackberries picked by the children the summer before and canned.

The first pangs of his hunger satisfied, George Wilson raised his head, glanced worriedly at his family and then addressed his wife:

"Well, Nancy, we're in for it."

She knew perfectly well what he meant, but she snapped back:

"In for what? Why don't you say what you mean, Mr. Wilson?"

The children looked at her in surprise, for they were not used to hearing her snap at their father. But apparently he took no notice, for he an-

taking his time to change his clothes, trying to get up his courage to ask his father for the loan of the horse and buggy. So he paused to look at himself in the cracked looking glass in the old bureau. He saw a tall boy, thin and hard from work and weather; red hair, inclined to curl, matched a red face covered with freckles. His generous mouth, usually parted in a grin, and his intensely blue eyes now reflected his dissatisfaction and disgust with his clothes, his appearance, and everything in general.

But finally, realizing that if he was going to the party at all he would have to get along, he went downstairs into the sitting room where his father sat smoking his pipe and reading. So absorbed was George Wilson that Mark had to speak twice before his father looked up and said:

"What is it?"

"I was wondering—" said Mark, hesitantly, "if I could have old Molly and

the buggy to take Ann over to the party at John Hover's tonight?"

Impatiently his father pushed his steel-framed spectacles up over his brow and scowled:

"Tisn't over a mile to Hover's. What in the world do you want with a horse?"

"It's muddy, Pa," explained Mark, "and I hate to ask a girl to walk in the mud."

"Won't hurt her a bit! Young folks are getting too soft. I didn't have a horse and buggy and I lived a good deal farther from your mother than you are from Ann. Besides," he continued, "the team's tired. You know they are. They've been working all day. They need their rest."

He pulled his spectacles down again and raised the paper. Mark left the room, banging the door behind him, and marched off down the road to Ann's house, anger and frustration evident in every step that he took. But the feeling of spring in the air, a bright full moon and the fact that he was going to see his girl soon restored his spirits. By the time he got to his destination, he didn't even mention his lack of conveyance, but took her hand and they started for Hover's along the side of the muddy road.

Ann talked gaily about Spring's coming and the many different birds she had seen that day. She bubbled with good spirits and enthusiasm, and Mark was content to listen and to watch her animated face as she skipped along beside him. As he always did when she was in this mood, he thought how lucky he was to have her. Covering her brown hair was a gay little bonnet, from under which soft curls escaped to frame her face. Slender, strong and willowy, with merry brown eyes, a wide mouth with upturned corners, and a freckled nose which could only be described as pug, she was an extremely attractive girl, especially to Mark, who loved her. Her disposition was merry but mercurial. She was easily provoked to quarrel at one moment, but was immediately sorry for any hurt that she caused to others.

Noticing Mark's silence after a while, Ann said:

"Why are you so quiet, Mark? Mad about something?"

Instead of answering her question directly, Mark said:

"Ann, you know all about this war talk. What would you think about my going to war?"

"Wouldn't like it," she answered promptly.

"Well, I wouldn't, either," he admitted, "but things seem to be getting pretty hot. Down in the village the other night I heard some of the older men talking about it and they seemed to think that a lot of us will have to go pretty soon."

"Those old fellows ought to have to go themselves. It seems to me from what history I've studied, that's always the way. The old men get us into war, and you young fellows have to fight it—you and the women who have to stay home and keep things going while you're gone."

"Aw, now, Ann, that's not quite fair. What're you going to do when the other side forces you into war? There comes a time, I guess, when you have to fight."

"I don't believe that time's come yet," retorted Ann, tossing her head. "I don't even know what it's all about 'cept what two or three old cranks around the neighborhood like Bill Leonard say. He's always talking about freeing the slaves. I'll bet if he owned some he wouldn't free 'em."

"I'll bet so, too," agreed Mark, laughing. "But just the same we can't have those Southerners breaking up the Union."

"Maybe they wouldn't if we'd mind our own business and leave their property alone."

"Well, whatever has caused the

(Continued on Page 22)

New Partner

"MY SON, this land I leave to you to hold and cherish; manage it well so that your sons, and your sons' sons, may be proud to own it in their turn."

Those might well be words for all men who love the land they live on. For deep in their hearts they want to keep their land in *their* family—want to leave every acre to oncoming generations in better condition than when they received it.

Country people of today have become more dependent on the city; for many everyday commodities, for their fun and recreation, for much of what is *thought* to be a better standard of living. The city's seemingly "greener pastures" lure many a country-bred youngster.

There is, however, one great inducement for a young man to stay with the land. It comes from parents who are willing to share with their children the management of the land; to share the *rewards* as well as the *responsibilities*.

Then father and son become *real partners*—in their business, in their way of life, in their aspirations. The ties of family hold firm. Side by side their roots run deep into this rich American land. Each "partner" is rewarded fairly for what he puts into the family enterprise. Each gets a fair return for the labor, capital and ability which he contributes . . . And he of the younger generation sees ahead a clear, straight road, and a secure future.

Our interest at Swift & Company in this and other matters of importance to farm and ranch youth, is natural. Our business life is closely linked with the land . . . and with the young folks who will take over the management of land and livestock in the years to come.

"A NATION'S MEAT"

Interesting—Informative—Entertaining
Just re-photographed in beautiful natural color

Swift's newest film tells the story of meat from the western range to the kitchen range. Now available to ranch and farm organizations, F. F. A. and 4-H Clubs, and other groups. 16mm. sound film—runs 27 minutes. All you pay is transportation costs one way. Write Swift & Co., Agricultural Research Dept., Chicago 9, Ill.

Martha Logan's Recipe for

FRANK AND CORN CASSEROLE

(Yield: 4 or 5 servings)

1 pound franks 1/4 pound aged cheddar cheese
1 can No. 2 cream style corn cut in strips 1/4 x 5 inches

Place corn in buttered baking dish. Slit franks lengthwise almost through. Place strips of cheese in slit in frank. Press franks into corn so that they are level with surface of corn. Bake in a moderate oven (350° F.) for 30 minutes.

Hello Again!

Well, summer is drawing to a close. The harvest and heavy livestock marketing seasons are approaching. And here we are again visiting with

you folks who produce the nation's food.

As usual, during the summer I traveled around a good deal and talked with many ranchers and farmers. I always enjoy that. For, after all, you folks who produce livestock and we who process and distribute the meat have practically the same interests. We are both members of the Meat Team.

I am always pleased when I receive letters reflecting this team spirit. Recently I received one from a man in Iowa who puts this feeling into mighty clear words. I think you, too, will enjoy reading it.

Dear Mr. Simpson:

For many months we have read with interest and looked forward to your very fine agricultural ads. We have spent our entire life raising livestock and trying to help stock men produce meat more economically, and you people are to be commended on the very fine job you are doing in pointing out the over-all problems of the stock men. Further than that, there are millions of people in this country whose daily lives revolve around meat and meat products, who never stop to think of all the things that take place from the time raw feed material is grown until the finished meat product is set on the dining table.

Swift & Company has played a very important part in the progress of American agriculture and the diet of the American people and we know that you will continue to make worth-while contributions. We are looking forward to meeting you some time personally because we always like to rub shoulders with people that dedicate their lives to the things that are worth while.

That letter warmed my heart. It's the kind of expression that makes us all proud to be part of this great livestock-meat industry that serves our country so well.

F.M. Simpson.

To Market . . .

Green grow the pastures, the cornstalks grow tall;
Sleek hogs and fat cattle come to market each fall.

Brown eggs for Boston, white eggs for New York,
Dressed poultry and butter, choice beef, lamb and pork.

Whatever you market, Swift's always your friend,
Competing to purchase the products you send.

Soda Bill Sez:

More thoughtful whittlers and fewer thoughtless chisellers would be a big help to America.

A man in too big a hurry is liable to pass up more than he ever catches up with.

Feeding Cattle for Profit

by Paul Gerlaugh

Ohio Agricultural Experiment
Station, Wooster, Ohio

Paul Gerlaugh

In October the market price difference between choice and common slaughter steers is twice as wide as in May. This is due to fluctuating cattle supply, not changing meat demand. The feeder who buys medium or common steers in the fall to feed for the spring market makes no mistake. The man who produces common feeder steers *does* make a mistake . . . Last fall choice feeders cost us \$43.00 per head more than common steers (when both weighed about 650 pounds). Quality pays the *producer* well. Lack of quality in feeder cattle, due to lower cost per cwt., invariably rewards the *feeder* who purchases in the fall, when pastures are emptied, and gives his cattle a five- or six-month feeding period. Choice feeder cattle should be given a choice finish and timed for the summer or fall market. They sell well then.

In an eight-year test, home-grown steers, all of one breed (800 to 900 pounds), dressed 60.3% and yielded carcasses grading 76% choice. Similarly cared for steers of another breed dressed 59.6% and yielded 59% choice carcasses. However, the lower dressing and grading steers saved 115 pounds of corn and cob meal in making a hundred pounds of feed lot gain. At present prices the saving in feed costs was greater than the reward for higher dressing percentage and carcass grade.

Market topping ability of feed lot cattle is not a safe guide to profitable beef cattle operations. "Pretty is as pretty does" is a much safer beef cattle philosophy to follow in seeking profitable operations.

The barn and hen house on the farm of Otto Neidlinger of Bainbridge, Chenango County, New York. Mr. Neidlinger and his three boys, Fred, Douglas, and Otto, Jr., have 90 head of Holsteins, 60 of which are milkers. They also have 1,500 laying hens and 1,500 young stock.

They have been growing birdsfoot trefoil. They have two acres of pasture which was put out in 1940 and is still producing. There is also 12 acres of birdsfoot in the silo and there is another silo to be filled with corn.

"It goes in here and comes out here," could be the title of these two shots of a field chopper busy harvesting grass for silage on the Don Herrington farm at Cato, N. Y. The farm is run by Don's son, Bud, shown here trying out rented equipment used to fill his silo this year.

William Chafey, son of Mr. and Mrs. William Chafey, Mt. Holly, N. J., winner of the New Jersey Future Farmers of America Garden State Farmer award. He will represent New Jersey in the American Star Farmer contest this fall.

When the New York 4-H Club Congress was held at Cornell late in June, William J. Maloy, R.D. 2, So. Hammond, N. Y. (below at left), and Margaret R. Bull, R. D. 1, Homer, N. Y. (right) were presented with American Agriculturist Achievement Award gold medals. Both have been successful with 4-H Club projects, but more than that was necessary to win a 4-A award. In addition, both had shown a high degree of willingness to pass on to younger boys and girls in the neighborhood the benefits of membership in a 4-H Club.

Cooks to Compete

AT NEW YORK STATE FAIR

GOOD cooks will get their innings at this year's New York State Fair, starting September 2. Each week day during the Fair, there'll be lively food competitions in the auditorium of the Women's Building. Cash awards with two first prizes in every classification will be given, and a silver loving cup, given by the Fair, will be presented by Commissioner C. C. DuMond at 5 p.m. for the best entry each day.

The idea of a "New York State Foods for New York State Families" contest grew out of a conference of five of the big producer groups in the State and two Fair officials — Mrs. Martha Eddy, Director of the Women's Department, and State Fair Director Harold Creal. The five producer groups include the American Dairy Association, the Empire State Potato Club, the NYS Vegetable Growers, the NYS Poultry Council, and the State Horticultural Society.

On the first day of the Fair, the contest will be open to those who are 18 years old or younger. Cookies and quick breads made with milk, and suitable as refreshments with a milk drink, will be featured. On that day, also, there'll be another contest, "Name Your New York State Cheeses," with \$1 each going to the 10 contestants having the most nearly perfect scores.

Labor Day will find home canners entering their exhibits of canned and pickled vegetables, as well as fresh vegetable trays. Even centerpieces arranged from fresh vegetables will be in line for prizes.

Cake Makers' Day

On Tuesday, cakes using eggs, the more the better, will be on display, and rumor has it that cake makers have been practicing up on angel food and chiffon cakes for their Fair entries!

Apple pie, cherry pie and peach pie will be in the limelight on Wednesday; also canned apples, cherries and peaches, and jams, jellies, butters and preserves. On Thursday, New York State potatoes will have their turn with entries of potato bread, potato rolls, and fried cakes and coffee cakes using potatoes in the recipe.

Friday will be a repetition of the first day's contest, except that it will be open to all age-groups and there will be classes for unusual milk dishes. The cheese-naming quiz will also be re-

peated on Friday, which has been officially dubbed Dairy Day.

Besides the foods contests, there'll be demonstrations of how to bake the new triple-rich bread which the State serves in its institutions, and the recipe for which came from Cornell University. A bakery, set up by the State, will show how it's done on a large scale, and Fair visitors will have a chance to sample the bread. As soon as a loaf comes from the oven, it will be sliced, spread with Dairymen's League butter, and passed out to bystanders. There'll also be a demonstration of the home baking of this bread by one of the County Home Bureaus.

And all of these "mouth watering" exhibits of food are not the end of the story. Each week day at the Fair, at 10 a.m. and 2:30 p.m., outstanding 4-H girls in the State will roll up their sleeves and show visitors how to bake topnotch pies — cream, lemon and cherry!

Baby Sitters Provided

So that no one will have to remain away from the Fair for lack of a baby sitter at home, a nursery service has been arranged by the American Red Cross in the Women's Building, from 9 a.m. to 5 p.m., for children from 6 months to 6 years. Older children, from 6 years of age on can be left with the recreation leaders in the playground area at the back of the Women's Building, from 9 a.m. to 6 p.m. Parents must supply the food which they want their children to have.

Other Attractions

Incidentally, Dad and the older boys, as well as Mother and the girls, will be interested in the goings-on at the Women's Building. For one thing, there's to be a miniature railroad exhibit on the main floor of the building, operating with both diesel and steam type locomotives on a double track main line. And of course the Little Theatre performances in the auditorium, with players from all over the State, will attract the whole family. Participating groups include The Footlighters of Kingston, N. Y.; United Theatre Players, Brooklyn; Liverpool Theatre Guild; Theatre Workshop, Utica; the Little Theatres of Watertown, Ilion, and Elmira; and the Little Falls Summer Theatre.

—Cornell University Photo.

SURE TO DRAW A CROWD at this year's New York State Fair are the daily demonstrations of how to make rush seats, to be given by the Chenango County Home Bureau in the Women's Building. At a Cornell University training school held earlier in the year, Home Bureau agents were instructed in the art by Mrs. Ruth Comstock, home economics extension specialist (center in picture). Left is Mrs. Helen Tunison, Tioga County agent, and right, Miss Patricia Hanes, assistant agent in Wyoming County. The making of rush seats is just one of eight interesting Home Bureau exhibits to be featured at the State Fair this year. The others include the making of rag rugs, sewing helps, care of house plants, and the home baking of the new triple-rich bread.

Here's the Range That COOKS, BAKES, HEATS With Oil Or Electricity

MEALMASTER OIL-ELECTRIC COMBINATION

Now you can have all year 'round kitchen comfort with a Mealmaster Combination Range. Cook, bake and heat with oil during the winter months, use electricity for fuel during the summer months. For free illustrated folder, write Knox Stove Work, Inc., 2011 Ailor Avenue, Knoxville, Tennessee.

Completely insulated two-fuel oven has two inches of FIBERGLAS insulation on all sides. Thermostatic oven control with either fuel. Bakes perfectly in any rack position.

OIL-ELECTRIC COMBINATION

Uses either oil or electricity for fuel. Completely insulated, extra large oven with automatic control for any baking temperature. Copper coil for heating water also available on this model.

COAL-ELECTRIC COMBINATION

Same features as above with coal instead of oil.

Cooking top for each fuel cleans easily. Chromolox electric units offer you a choice of seven different heats. Heavy cast iron oil cooking top gives you plenty of cooking space.

Forced Warm Air for Room Heat. A turn of the selector dial to room heat starts a fan which delivers warm air into the room from the grill in the base . . . at floor level where you need the heat.

Growing wheat?

Increase your yield and
lower your costs with

Blenn!

This year especially, the bigger the yield you get from every acre at low cost, the more money you'll make from your wheat crop.

Just as a combine is designed to save labor and money at harvest time, BLENN is designed to help produce bigger wheat crops at lower cost. So this year especially, you should use BLENN—Swift's specialized crop maker—along with good seed.

Here's the reason: BLENN is especially made to supplement the plant food nutrients in your particular soil. Together, your soil's natural nutrients plus BLENN supply all of the many plant food elements your wheat crop needs for finest growth and biggest high-quality yields at lowest cost.

Using BLENN pays off!

BLENN is a low-cost investment that pays big dividends in far higher yields from every acre you plant. BLENN more than pays for itself—it brings in extra cash besides.

BLENN is 4 ways more uniform

BLENN grows more bushels per acre because it is a *specialized* plant food that is so uniformly blended that every plant gets a perfectly balanced ration of needed growth-making elements. Swift's *exclusive* manufacturing process makes BLENN more uniform in four important ways: (1) uniform blending, mixing, curing; (2) uniform freedom from caking, lumping, bridging; (3) uniform distribution through your machines; (4) uniform feeding of your crop.

BLENN feeds your crop from the very beginning right through to harvest. It produces a uniform wheat crop with long heads, well filled with high-grading grain.

This year, increase your yield per acre at low cost with BLENN. See your Authorized Swift Agent today and order this crop-boosting, income-boosting plant food early.

Swift's New Process

Program Excellent—Attendance Light at N.Y.S. Vegetable Field Day

THE program at the New York Vegetable Growers Field Day at Ithaca on August 12 was excellent, but the attendance was disappointing. Where several thousand had been planned for, only about a thousand appeared.

If future field days are as well organized and as packed with information, we predict that attendance will be better. Certainly those who did attend will go back home and tell their neighbors that they missed an excellent opportunity to see and hear the latest in vegetable growing.

As usual, demonstrations drew the spotlight. Early in the day various types of soil tilling equipment were shown on a field which was dry, lumpy, and weed infested. It was an excellent opportunity to see how various types of equipment operated under adverse conditions. Several new machines were shown, two of which are still in the homemade, experimental stage. One of them was designed to pick sweet corn; the other was a small wheelbarrow sprayer which used a concentrated spray so an acre could be covered with 10 gallons. Also shown was a spinach harvester which gave a demonstration on beans, inasmuch as no spinach was available.

The State Department of Agriculture and Markets had an excellent exhibit showing several types of violations of regulations on the marking of packages. Among violations shown were over-facing, packing in old containers without destroying the previous markings, and mislabeling as to grade.

At the brief speaking program immediately following lunch, Dean Myers pointed out that field days are one means of getting the results of college and experiment station research to growers quickly. Dean Myers believes that farmers are in excellent shape to meet any foreseeable demand for food. He feels that the South Korean situation may be the first of a series of aggressions by Communist satellites.

Walter Pretzer, president of the Vegetable Growers Association of America, gave the following five rules for assuring profits from vegetable production:

1. Have patience to acquire knowledge about vegetable business through observation, study and practice.

2. Be cooperative by sharing your personal "know how" with other growers.

3. Give a balanced amount of time to promotion of the business at local, state and national levels.

4. Bring adequate returns to labor by letting workers share in the profits of the enterprise.

PAUL WORK (center) describing the important characteristics of snap bean varieties grown in a test plot at the Vegetable Field Day.

5. Be enthusiastic in relations with the vegetable industry, the family, the church, and the community.

Throughout the day a helicopter gave dusting demonstrations; there were irrigation demonstrations, and buses were available to take vegetable growers to field plots and laboratories of the College and Experiment Station.

There was a time when a thousand would have been considered an excellent attendance at such an affair, but that time has passed. Every person who took part in the planning and execution of the Field Day deserves much credit. We hope that as good a Field Day will be put on in 1951 and at least 5,000 people will be present.

"Now what do I say to shift gears?"

When Dairy Cattle Bloat

By **STANLEY N. GAUNT**

Massachusetts Extension Dairyman

HAVE heard a lot of talk about bloat but never had any trouble until last week." This typical statement was made to me last September. Yes, bloat isn't an everyday occurrence but some day you may lose your best cow from it. What can you do? Why does bloat occur? What conditions bring it about, and what can you do to prevent and control the acute form of bloat that occurs when dairy cattle are grazing pastures?

Bloat has occurred on the following green legumes: alfalfa, ladino clover, sweet clover, burr clover, red and white clover, trefoil, and peas. It is an excessive accumulation of gases and distention of the rumen or paunch. Research workers agree that the reason for the excessive accumulation of gases under certain feeding conditions is that the animals cannot belch. The gases found in bloated animals are found in the rumen of normal animals under normal feeding conditions, but then are either belched or given off through the excretory organs.

How Common Is Bloat?

I have been unable to find any figures on the number of cases of bloat here in New England. However, a survey in Minnesota reveals that of 11,205 cows pastured on alfalfa and sweet clover in about equal numbers from May to October, 182 cases of bloat were reported and of these 50 were fatal. Alfalfa caused 28 deaths, sweet clover 20, and 6 cases of bloat (non-fatal) were reported on non-legume pasture. Only 25 animals under 2 years of age bloated.

At the time of this survey ladino clover was not as prevalent as it is today, but I am sure in New England that ladino is right at the top in the list of legumes causing bloat, particularly since more ladino is pastured here than alfalfa. Red and white clover would probably follow after alfalfa on the list. Few cases have been reported on birdsfoot trefoil pasture, perhaps because it is relatively new and because there are few pure stands.

Stands of legumes which consist of 50% or more of grasses rarely cause bloat, although the stage of growth, the amount of rainfall, and herd management are all factors. Immature legumes that have grown rapidly are

more apt to cause bloat, and a season of heavy rainfall causes rapid growth of plants and more appetizing feed, and switching cows from fields of little pasture to good stands of legumes increases the chance of bloat.

Why Can't Bloated Animals Belch?

A theory held by many until recently was that bloat in ruminants (animals that chew their cud) is due to excessive gas production. It has now been shown that no more gas is formed on a bloat-provoking diet such as green alfalfa than on a non bloat-provoking diet such as alfalfa hay and grain. Animals have the ability to eliminate far more gas through belching than is produced in the rumen.

It appears from the evidence at hand that there are several causes of bloat:

1. DENSE FEED THEORY — It is known that an obstruction in the esophagus such as a small potato or apple will cause the animal to bloat. This observation, in addition to experimental work, has led to the theory that when ruminants eat legumes the anterior (front) portion of the rumen fills up with a heavy mass of the food and shuts off the opening of the esophagus to the stomach preventing the animal from belching.

2. TOXIC GAS THEORY — Legume plants, which most often cause bloat, contain relatively high percentages of protein which produce an excess of toxic gases in the rumen. These gases, single or combined, partly paralyze the rumen and so prevent belching. When the animal cannot belch, the pressure is increased and toxic gases are absorbed into the blood which may be deadly.

3. FROTH AND FOAM—A third theory is that plants on which animals are known to bloat most frequently contain saponins that cause froth and foam in the rumen and that the froth and foam have entrapped the gases.

4. ROUGHAGE NEEDED—The "lack of coarse roughage" theory is backed by more experimental evidence than other theories. It is based on the fact that an animal rarely bloats on dried fibrous hays such as alfalfa. Carefully controlled experimental work has demonstrated that tickling the anterior

(Continued on Page 19)

WHY FEED YOUR CALF DOLLARS?

When you can feed **KAFF-A**

The safe replacement for milk!

Sell your cow's milk! Don't waste it on your calves. That's just like feeding them dollars! Low cost Kaff-A is an absolutely safe replacement for milk! When you feed Kaff-A, the milk your cows produce goes to the dairy—puts dollars in your bank account. Just 1 lb. of Kaff-A can replace up to 10 lbs. of milk in calf feeding. That means every 50 lb. box fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! A handsome extra profit!

With Kaff-A no milk is needed after the 10th day. Kaff-A is tested, tried,

proved a safe replacement for milk. A million healthy heifers have already been raised on it! Its dried buttermilk base is known for its nutrition. In addition, Kaff-A contains other dairy by-products, some cereal products, and plenty of Vitamin A and D Feeding Oil!

Don't risk your calf's health on inferior imitations of Kaff-A. A few pennies saved now may cost you many a dollar if your calf becomes a stunted cow. Feed Kaff-A and be sure that your calves get the nutrition that helps develop good milkers... good breeders!

The 1950 N. Y. State Fair Will Be Worth Seeing

OPENING day for the New York State Fair is Saturday, September 2. Everyone connected with the Fair sincerely hopes that no one will remain home as a result of the traffic congestion which occurred in 1949 on the opening day which, incidentally, was Labor Day. Whatever the attendance may be, plans have been made to handle the traffic easily and quickly. The number of entrances has been increased by adding a new series of gates at the western end of the grounds, and there will be salesmen to sell you tickets without the necessity of your leaving your car. A new parking space has been added to handle an additional 5,000 cars.

New Roads and Buses

Incidentally, if you have not attended the Fair for some years you will be pleased to find that the old dusty roads have been replaced with hard pavement. Also, it is no longer necessary to walk the length of the grounds, only to find that the next event you want to see is blocks away. You will find this year that buses circle the Fairgrounds. For a nickel you can get on at any of the many stops and get off in the vicinity of the building or event next on your list.

It will be impossible to more than mention here some of the high spots you will see at the fair. With Harold Creal, a practical farmer, at the helm, and with the help of Earl Foster and others who did such a good job last year, you may rest assured that the importance of farming will be recognized at the Fair, and that the entire exposition will be handled efficiently.

High Spots

Here are some of the high spots:

Cattle Show. Entries are expected to exceed last year's alltime high of 1,500; judging in the coliseum will begin on Monday, September 4, and will end on Thursday afternoon, September 7. All livestock, however, will be exhibited from Saturday to Saturday of Fair Week. Premiums total \$22,200.

Horse Pulling. The horse pulling contest always attracts a good crowd. It will be held at 11 A. M., Wednesday and Thursday inside the race track.

Boys' and Girls' Department. This is a complete "Fair within a Fair," with rural and urban youth competing for \$15,207 in premium money. You'll see everything from crocheting to tractor

operation contests, from livestock judging competitions to exhibits of jams, dresses, and home grounds improvement projects. Exhibits represent the best in each of the 54 counties entering displays.

Home Bureau Exhibits. Eight counties will participate in this interesting and highly educational program in the Harriet May Mills Memorial Building. Constant demonstrations in exhibit booths will include bread-making, rug weaving, care of house plants, and the making of rush seats. Daily demonstrations may be viewed free of charge.

Little Theater. Returning after absence of 28 years, the Little Theater will present one-act plays produced by community groups over the state; players will be selected from among 45 community theater organizations. Plays will be presented in Harriet May Mills Memorial Building Monday through Friday, at 6:30 p.m. and on opening day, Saturday, September 2, at an earlier hour. Admission is free.

"New York State Foods" contest. See page 11.

Harness Racing. The nation's finest trotters will compete for \$85,000, one of the richest purses ever offered, for five days of the Fair. This will be the first harness racing at State Fair since pre-war years.

Better Homes Exposition. A multi-million dollar display of material needed to build, renovate or furnish a home will be shown. One of the most popular features of the State Fair last year; a complete exhibit of everything pertaining to the home—from cellar to rooftop. Show covers 40,000 square feet of space.

100-mile Championship Auto Race. National auto racing stars will return to the famous State Fairgrounds' track for classic running of the 100-mile big car championship race. AAA-sanctioned, race is usually determining factor in national championship standing because of high point rating. Vying for repeat victory will be Johnny Parsons, 1949 State Fair winner, who also won the 1950 Memorial Day race at Indianapolis. To make track dust-free, workers are removing two inches of track's top covering and replacing it with clay.

Indian Village. Early America lives again in this colorful, fascinating exhibit for young and old. Live Indians in all their colorful dress will perform

(Continued on Page 21)

With **AMERICAN AGRICULTURIST** Advertisers

A new illustrated sprayer catalog is now available from the **MASSEY-HARRIS COMPANY** of Racine, Wisconsin. The catalog illustrates two models that are adaptable for grain or crop spraying. If you would like to have a copy of the catalog, just drop a postcard to the above address.

The Lederle Laboratories Division of the **AMERICAN CYANAMID COMPANY**, Pearl River, New York, is now marketing an improved aureomycin ointment for mastitis. The new ointment contains twice the amount of crystalline aureomycin that the former ointment did. Lederle veterinary scientists have proved conclusively that the new ointment greatly increases the effectiveness of the product without causing any undesirable effects on the udder.

When you visit the New York State Fair, be sure to stop at the Thermopane exhibit of the **LIBBEY-OWENS-FORD GLASS COMPANY**. At the exhibit you will see the **Solarometer** which shows the direction the sun's rays come from at any hour of any day.

CRABINE, INC., silo manufacturers of Norwich, New York, are concerned over the danger of the possibility of suffocation in silos. As most of you know, carbon dioxide is formed from newly ensiled corn. This is heavier than air and a person who goes into a silo can be suffocated. The company has an 8x10 card calling attention to the danger, telling how to avoid it, and how to give first-aid to a victim that is overcome. They will be glad to send you a card on request so that you can post it on your silo.

The New Idea Division of **AVCO MANUFACTURING CORPORATION**, Coldwater, Ohio, has been testing out a farm elevator for some time. The result is their new No. 175 elevator with 3 important features: (1) Its ability to handle anything; (2) Its easy maneuverability; (3) Its lifetime construction.

It is always interesting to speculate relative to the ownership of big business. For example, at the middle of the year **DUPONT COMPANY** was owned by 118,732 stockholders, an increase of over 19,000 as compared to the year previous.

The "Scythette" is manufactured at **Watkins Glen** right in central New York. It is a power scythe which cuts weeds or clips hedges. It is powered by a light aluminum built gas engine which weighs only 24 pounds, so it can be easily carried. For a descriptive folder, write to **THE POWER SCYTHE COMPANY**, Watkins Glen, N. Y.

This spray tank can be hooked to the tractor as it is used to cultivate corn, thus making it possible to apply DDT for corn borers, while the corn is being cultivated. The sprayer is made by the **ENGINE PARTS MANUFACTURING COMPANY** of Cleveland, Ohio.

How to Mix Concrete for Farm Buildings

By SEWARD FOOTE

THE BEST concrete costs just a little more than the poorest; it's "penny wise and pound foolish" to cheapen the construction of the most important part of the structure. In many cases, mixing procedures are at fault; better, stronger concrete can often be made by following a few simple rules which may also result in a cheaper as well as stronger mix.

The strength and durability of concrete depend to a large extent upon the quality of the sand and gravel, PLUS the quality of the cement-water paste that binds these aggregates together. The sand and gravel (or crushed stone) should feel sharp and gritty. They should be free of dirt, clay, or humus material. The water used in making concrete should be clean enough to drink. When using damp sand in the mix, combine the water with the cement in the ratio of 6 gallons per sack of cement. If the sand is wet from a recent storm or washing, reduce the amount of water to not more than 5 gallons per sack.

Avoid Excess Water

The importance of maintaining the correct water-cement ratio can be demonstrated by recalling that any water-mixed paste will be weakened by an excess amount of water. Wall paper will not stick with too much water in the paste; the strong casein glues used in furniture manufacture will not hold if too much water is present. In the same manner, too much water in a concrete mixture may result in a weak concrete; not only from the weak paste, but a concrete mix that is too fluid allows the excess water to carry the cement with it when it runs out of the forms and also causes the light sand to separate from the heavier stone when it is wheeled to the forms, thus resulting in a stratification of the aggregates, making a streaked, weak wall.

If you use screened stones for concrete, combine this material with the sand in the ratio of 3 shovels of stone to 2½ shovels of sand. Some variation may be necessary here, the objective being to get enough sand into the mix to fill all the spaces between the stones with enough excess sand to finish well on the surface.

Concrete Is Permanent

This mixture of sand and stone can then be combined with our mixture of

cement and water, and when properly mixed, placed, finished, and cured will result in a permanent concrete job that will endure for generations. Machine mixing of concrete is better, faster, and easier than hand mixing. Many farms own a small mixer, and in nearly every community they are available on a nominal rental basis. Most of these small farm mixers will hold a third-sack-batch. That means 2 gallons of water to a third of a sack of cement for our cement-water paste. Let's mix a batch.

Get all materials as close to the job as possible. Start the mixer and put in 2 gallons of water. Then before adding the third of a sack of cement, put in 2¼ shovels of sand and 3 shovels of stone. (If we are using bank-run sand and gravel, we can put in about 5 shovels of the material.) The sand and stone will furnish enough abrasive action to beat up all the lumps of cement and mix it thoroughly with the water. This will result in a good mixing of our cement-water paste and we will not add any more cement or water; simply continue to add a little sand and stone in the ratio of 2¼ parts of sand to 3 parts of stone until the mixture is plastic. Mixing should continue for about 3 minutes to be sure that every grain of sand is covered with the cement-water paste, thus making, in effect, a mortar that will bind every stone to another, resulting in a dense, strong, water-tight concrete.

Good Forms Important

Put the concrete in well-constructed forms and finish as soon as the water sheen has disappeared from the surface. (Usually 1 to 2 hours). A wood float is all that is necessary for most parts of the dairy stable. Added roughness can be secured by drawing a stable broom across the surface. For mangers or other sanitary surfaces, the wood float may be followed by a steel trowel for a perfectly smooth surface.

Curing the fresh concrete is important. The chemical changes which occur in the interior of the concrete require the presence of moisture and take 5 to 28 days for completion. The fresh concrete should be covered with some clean material such as straw, bags, or sand, and kept constantly wet for the first 5 days. After this initial curing period the concrete may be put into limited service, but will not be completely hard for another 23 days.

Machine mixing of concrete is faster, better, and easier. If you do not own a batch mixer, you can usually rent one.

3 Big Features you'll like

about the

MASSEY-HARRIS SPREADER

- 1 SHREDS EVENLY
- 2 SPREADS UNIFORMLY
- 3 LOADS EASILY

Feature for feature, you'll like the Massey-Harris Spreader. It's fast, dependable, sturdy spreader... easier to load... easier to handle.

Low-slung body cuts work out of loading... makes a speedier job of it. Every trip to the field really counts... the flared sides of the big, sturdy box let you pile it on!

Out in the field, the Massey-Harris Spreader can't be beat for fast, efficient unloading. Staggered teeth on the beaters do a thorough job of shredding. Durable, auger type distributor spreads the manure in a wide, even blanket — as heavy or light as you want. Cylinder ends are protected

against wrapping and binding. Gears are covered.

Massey-Harris Spreaders are made to last. Years of service are built into the acid-resistant wood box. Husky frame stands the jar and jolts of fast, heavy hauling over rough, frozen ground. Screw-type jack hitch makes hookups faster... safer... easier.

Stop in and see your Massey-Harris dealer. Let him give you all the facts about Massey-Harris Spreaders. He'll be glad to tell you about the complete line of modern Massey-Harris Farm Equipment. For free folder on manure spreader, send coupon below.

STARTED PULLETS

We are doing the largest volume of business in Started Pullets in our 30 years in Poultry. We have them 4-6-8-12-16 weeks old up to ready-to-lay.

That means they were last May-June-July or August baby chicks. So you see, you can still get early hatch birds. You have not lost a day. They are priced so low, they will cost you less than if you had raised them yourself. We have dandies in all the popular breeds ready for immediate delivery.

STARTED CAPONS

You will never go wrong with capons. They are the economical family size bird, so much in demand today. Their meat is delicious and tender. They consistently bring highest premium prices. Once you try them, you'll always buy them. We have them 4-6-8 weeks of age in the popular breeds ready for immediate delivery.

This is the Season When "Blue Comb" Hits Pullets

By L. E. Weaver

FROM THE poultry disease laboratory at Cornell, Dr. P. P. Levine has warned that a few cases of Blue Comb have been received in the laboratory. Since this is the time of year when this disease makes its annual appearance, Dr. Levine says that careful management of poultry flocks should be urged, especially when pullets are coming into egg production and when they are to be moved to the laying house.

Avoid sudden changes in feed, or if feed must be changed, do it gradually. Plenty of water should always be waiting for the pullets.

If the disease is suspected, start treatment at once, but get a diagnosis as soon as possible. Dr. Levine says that in many instances "we have encountered severe outbreaks of intestinal coccidiosis which produced the outward symptoms of Blue Comb disease."

Two treatments are suggested. The preferred one is to dissolve one tablespoon of muriate of potash in each gallon of drinking water. Use this medicated water for four days, then leave the muriate of potash out of the water but mix it dry in the mash at the rate of 1½ pounds in 100 pounds of mash. Feed this mash for ten days and don't feed any scratch grain during that period.

The alternative treatment is ½ cup of stock molasses in each gallon of drinking water. When appetites begin to return, omit the molasses in the water but feed a crumbly wet molasses mash made by mixing 4 pounds of molasses with 6 pounds of feed.

Muriate of potash is cheap and does not deteriorate. It is commonly used as a fertilizer and can be obtained at fertilizer stores. You ought to keep a supply on hand all the time.

Here is Dr. Levine's description of the Blue Comb disease. It hits suddenly, causes birds to go off feed, and egg production is affected quickly. At the outset, the combs may be a fiery red, but later they become quite dark, almost purple in color, and then begin to shrivel up. There may be some deaths at the beginning, but usually mortality occurs after the condition has been in progress a few days.

A New Angle

Poultrymen from time to time have noticed that certain strains or even certain families of chickens are more likely than others to take Blue Comb under the same exposure. That this is true was confirmed at Cornell last year. Blue Comb broke out on range among pullets that were pedigreed and wing-banded. So, when the trouble was over, it was possible to check up on the parentage of all the pullets that died.

Between July 8 and August 8, a total of 97 pullets died from Blue Comb out of a flock of 2857. Three separate strains and a cross between two of the strains made up the flock. In one of these strains (S), not one death from Blue Comb occurred in 221 pullets. In another strain (K), out of 1312 pullets, there were only 13 deaths. But among 986 pullets of C strain, there were 73 deaths, or 7.4 per cent. In the cross between K and C strains, there was a loss of 3.25 per cent, demonstrating the evil influence of C strain in the cross. Even in strain C there was one sire with 20 daughters and another with more than 40 among whose daughters there were no deaths from Blue Comb. It is evident that the ability to resist Blue Comb runs in families. That means one more job of selection for the progeny-test poultry breeder, and one more thing for the buyer of baby chicks to find out about if he can.

— A. A. —

NEPPCO EXPOSITION

The 1950 exposition of the Northeastern Poultry Producers Council will be called "The Sesquicentennial of Poultry as a Business," and the theme will be "Its spectacular growth to third place in the nation's agricultural enterprises."

The exposition will be held at the Farm Show Building at Harrisburg, Pa., and it will be a three-day affair from October 3 to 5 inclusive. As usual there will be a program of talks which will cover six essential parts of the poultry business—feeding, marketing, disease control, management, credit, and the poultry outlook.

The Poultryman's Question Box

We have been having some trouble with sour crops in our turkeys and would appreciate any suggestions for handling the situation.

There are several adverse factors that might cause sour crops in turkeys. The California Experiment Station proved that a tendency toward sour crops, which result in pendulous crops or vice versa, may be an inherent weakness in the birds. Another factor is environmental. For instance, birds in very hot climates or birds that do not have water kept before them all the time may become very thirsty, and then when water is given they drink large amounts at a time. This sometimes results in pendulous crops which become sour.

Another environmental factor has to

do with the feed. Dried grass or other indigestible material sometimes tends to plug up the opening between the crop and the stomach.

There is no really practical remedy for this sort of thing except to remove the cause. Once the bird has a pendulous crop, about the only thing one can do is to kill the bird and dress it off, or if you have the skill and the time you can split the crop, remove the contents, take a section out of the crop, resew it and it will recover. It's hardly worth while, however, because the crop must be kept covered, which is very difficult to do; otherwise the bird will tear the stitches out, causing it to die, or requiring it to be reseed. It really isn't particularly difficult to operate on the crop, but it just isn't worth while.—E. Y. Smith.

* * *

I am planning to build a disposal pit for dead chickens. Can you give me some ideas as to proper size?

Fifty cubic feet for each 1,000 birds should be ample for a year, but while you are building it, better make it at least twice that big so that you can use it for at least two or three years.

BABCOCK'S HEALTHY CHICKS

**MAKE GREAT LAYERS**

Our White Leghorns are making high records in 1950 laying tests. In 1948-49 official egg laying tests, our Leghorns won as follows: 1. High White Leghorn Pen All Tests. 2. High Pen all breeds in profit class at California. 3. High Leghorn Pen at Pennsylvania, Western New York and Georgia. 4. High Four Pens all breeds at Pennsylvania. 5. Poultry Tribune Trophy (273.50 eggs and 287.9 points per bird). We still hold All-Time World Record for one pen.

WE HATCH THE YEAR 'ROUND
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks... own two hatcheries with 530,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

THIS CATCHING CRATE was designed by Donald Marford of Marcellus, N. Y. Dan declares that the crate is much better than the usual type because every bird in it is clearly visible. The crate has a board bottom and a turkey wire top. Each end has a slide so that a series of crates can be put together as a brooder house for catching birds.

A FORUM FOR

Backyard Gardeners

I HAVE had some correspondence with A. W. Forbes of Worcester, Massachusetts, relative to the use of leaves on the garden. Mr. Forbes commented on his method so I asked for details, and his reply is as follows:

"With regard to the use of leaves, my favorite method is one of my own development, and I am not prepared to say how it compares with other methods. In the fall it is necessary to rake the leaves anyway, so there is no labor chargeable to the garden for that work. For the garden I dig trenches about 8" wide by 8" deep, pack in as many leaves as I can and cover with a little soil.

"The next year I plant one row each side of the trench so that there is no plant directly over it, but the nutriment from the leaves becomes available slowly and can be reached by the roots. Earthworms mix the leaves with the soil on each side, so that no further attention is required. Earthworms also pack castings from the surrounding soil among the leaves, so that the trench does not settle nearly as much as would be expected.

"Leaves decompose much more rapidly if something is added, but I am not sure that there is any other advantage in the additions. Sometimes I stir the partly decomposed leaves into the soil nearby, but if left for two years, the earthworms will do this for us. At that time turning up the soil shows no difference between the trench and the soil beside it."

Romaine

We have found this summer that romaine is the best hot weather substitute for lettuce that we have ever tried. It grows well; it makes a good head, and is very crisp and tasty. If further experience confirms the good points we already have observed, this will be our standard salad crop in coming years.

Perennials from Seed

Frequently when discussing gardens, my friends ask whether or not perennials can be easily grown from seed. It can be done, although the majority of gardeners doubtless prefer to buy them.

One of the easiest perennials to grow from seed is Sweet William. I have had good success by sowing seed collected from ripe heads late in summer right in a row in the garden and transplanting them either very late in the fall or early in the spring.

I have also grown lupines from seed

by the same procedure. Apparently not all the seeds produced plants, but I did grow enough to make it interesting and worth while.

One of the difficulties in growing some perennials is that seeds sprout very slowly. For example, it takes about 20 days for delphinium and gailardia seed to germinate. If they are put in a row in the garden, the weeds often choke them before they get started, or a heavy rain may wash them out. A few perennial seeds will germinate in 5 days, but most of them take from 10 to 20 days.

Save Onion Sets

Many home gardeners prefer to raise onions from sets rather than seed in spite of the fact that sets are more expensive per 100 feet of row. However, there is one way to cut down this expense, namely, to save your own sets.

Start by sowing onion seed early in the spring. Thin them out and use the ones thinned for green onions. Then if you are reasonably lucky you will have some nice onions to harvest and store in the cellar, but you will also have a lot that are too small to eat. Save them and use them for sets the next year. Also, it has been our experience that one of the best ways to get really early onions is to set out large onions grown from seed the previous year. In a very short time you can peel off most of the outside leaving 4 or 5 onions which resemble those grown from seed later in the season.

There is one difficulty you may encounter in saving your own onion sets, namely, that a considerable number of them may form seed. Set onions go to seed more where the sets are stored in a relatively warm cellar. Also some varieties go to seed more than others. One of the good varieties in this respect is Ebenezer. We remove the seed heads as they appear and find that they do not interfere much with using onions green. When they are harvested in the fall for winter use you can usually remove the section which contains the seed when they are peeled and use the balance on the table.

Why is it that rhubarb seed stalks seem to be more numerous some years than others?

There are a number of factors that affect this such as poor soil, dry weather, or hot, long days. Seed stalks should be removed because they weaken the plant.

A climbing rose like this on the picket fence of the Backyard Gardener requires little time, except for pruning after the blossom period is finished, and provides a wealth of flowers.

"My SD-3 has given me unbelievably fine performance from my forage harvester"

Says: ALBERT SAUTTER

R. F. D. # 1 Edison, Ohio

"My other new 3 plow tractor just could not do the job because of constant plugging up of the chopper." In Sautter's own words, it was the Sheppard Diesel's "live power take-off, wide choice of gears, added power and economy of operation" that sold him on trading in his brand new tractor on an SD-3 Sheppard Diesel.

ACCIDENT PREVENTION CAMPAIGN

Martin Hilfinger, president of Associated Industries of New York State, 47 West Huron Street, Buffalo, N. Y., recently announced the 26th annual Accident Prevention Campaign. The campaign is in the form of a contest which is open to every industry, mercantile establishment, and company, and covers the period from September 10 to December 9.

To be eligible, a participant must employ at least 15 workers. A folder giving complete details of the contest will be sent if you drop a postcard to Mr. Hilfinger at the above address.

By J. F. "Doc" ROBERTS

SINCE the first of the year there have been more cows marketed than last year, but fewer heifers have been sold. This places the future cow market and heifer sales in a very favorable position. Older sheep marketings have been 25 per cent greater so far this year, with lamb sales 2 per cent below last year. There goes the prediction of increasing sheep numbers—in fact, it looks as if the sheep liquidation is still going on! This is in spite of rapidly advancing prices and the demand for wool and for lamb meat.

These two livestock situations place the Northeast farmer in a very favorable position, for nowhere is grass so cheap or so plentiful. Even hogs, beef cattle, and chickens, while greater grain consumers, can by taking advantage of our grasses compete on any market.

Young livestock is at such a premium through the mid-West and West and transportation costs have increased so fast that we are rapidly getting into the position where we must raise our own replacements or produce them for the other fellow to feed and mature. Thus we will not only be improving our livestock situation but will be improving the outlet and prices for our grasses, hay and farm land.

More and better pastures and more and better livestock seem to be the

slogan all over this country. This is justified and sound, for certainly we want no more fields of potatoes, wheat, or corn, and I could also add vegetables, to go into commercial trade channels. Even with 500,000 less people on farms this year we are producing more of such foods, due of course to mechanization and better farm practices.

Livestock just cannot be increased that way; it's not the nature of the beast. With meat up to a dollar a pound and with by-products, such as leather and wool, in greater demand, and with an increasing population, our livestock is sure to be good property for some years to come. With war and its increased demand for animal products—even to a state of depletion, there is no surplus of livestock in sight for any time in the predictable future.

There will be a lot of poor hay this year due to late spring rains when we needed dry, hot weather. To get around this we have put away more hay than ever before—figuring that instead of allowing our animals to waste 5 or 10 per cent of it, we wouldn't force them this year to eat the last 20 per cent.

I have always had fair luck with poor hay by feeding more of it and using what is left for bedding. Animals do enjoy this kind of feeding and it is not all lost.

Now it looks as if we were in for a dry, hot spell. This is tough on pastures but good for lambs, and, if there is enough moisture in the ground, good for corn. This year, wheat was generally good, although most of it was planted late last fall after the dry weather. We are feeding our cows sweet corn nubbins and stalks cut green and we will continue to feed them some extra feed on pasture if it continues dry, to help out the pastures and the cows.

These cows are a rather interesting new experiment with us. Along in April we bought young, thin canner cows by the pound—mostly Holsteins. A few of them we had to milk out occasionally (feeding it to other livestock) but mostly they were giving less than 15 pounds a day, and they will absorb that much without bag trouble and its usual complications. In other words, we tried to dry them up as fast as possible. We turned them out just as soon as grass was available, and put a young bull with them, the idea being to try to get them to gain in weight and improve generally. They have done just that and, everything considered, it has proved to be a successful operation, at least this year. We'll soon sell them back for meat, but until then we do want to keep them gaining even though it is dry and hot.

—A.A.—

WHEN DAIRY CATTLE

BLOAT (Continued from Page 13)

portion of the rumen with a wisp of hay induces belching.

There are numerous other conditions that cause bloat, for one thing the lack of water. Dr. Bourne of Colorado reports a good example of this. He tells of a farmer who had the habit of going on drinking sprees. One day he left a couple of cows with lots of feed but failed to leave any water. He returned in three days to find one cow bloated. Dr. Bourne remarks, "If the farmer had drunk less and the cow more, both would have been better off."

Some animals are more susceptible to bloat than others; perhaps these cows require more stimulus. It is true that the more greedy feeders (including heavy producers) are more susceptible than the less greedy. Bloat occurred as early as 28 minutes and as late as 7 hours, in reported literature, after the cows were turned into pasture.

Prevention

The feeding of hay before pasturing has long been accepted as a recom-

mended practice for preventing bloat but it is not foolproof, as some have reported it was not effective. If cattle are to be grazed on pure stands of ladino clover or alfalfa that is in a lush condition, it may take a considerable amount of hay to provide protection. Under such conditions the hay should be particularly palatable. However, very leafy hay, such as fine stemmed alfalfa, is not nearly as effective. The hay may be fed to cows while they are in the stable or in feed racks outside, but because of the speed with which bloat may develop, the hay should be fed before the cattle go on legume pastures.

Other preventative measures include overnight pasturing on grasses, particularly sudan, rather than continuous grazing on legumes. Apparently sudan has an advantage over most grasses in that it is palatable and its coarse texture may help induce belching. Mixed stands of grasses and legumes very seldom cause bloat. Clover bloat is most likely when clover is four to six inches high, and after stems appear the danger is less. Keeping cattle off legumes until they have reached the early bloom stage helps prevent bloat but this would reduce the amount and the quality of pasture feed that could be secured. Avoiding the pasturing of legumes when they are heavy with dew or rain will help but will not prevent bloat in all cases.

Treatment

Most dairymen aren't equipped or have not had the experience to handle cases of bloat. Further, when you really have a serious case, the best help is needed, so call a veterinarian and ask him to get there quick! In some cases the treatment may consist of administering drugs to stop fermentation or to induce belching. In mild cases, massage of the left flank is an effective help in reducing bloat. The feeding of hay such as sudan grass apparently has a beneficial effect in such cases. A wooden bit is thought to help. Some recommend that bloated animals be led uphill or that they be placed with their front feet elevated.

In more severe cases it may be found necessary to relieve the animal of the excess gas with a stomach tube or a trocar and cannula. If time and a stomach tube are available this should always be the treatment of choice because of the danger of infection by use of the trocar.

A new treatment reported by Dr. A. H. Quinn, a veterinarian of Kansas City, Mo., appears to be promising. He reports the development of a new chemical agent which increases the surface tension in the rumen of the cow, breaking the foam and the froth, thus releasing the gas. One of these new chemicals, called polymerized methyl silicone, has been highly successful.

Much more needs to be known about the subject of bloat. What is the bloat-provoking capacity of different types of legume pasture and the amount of different roughages needed to provide some protection? Research work is being conducted at several experimental stations with the hope of finding the answers.

**Finest Silage
Lowest Cost
MARTIN
METAL
SILOS**

Produce most nutritious grass or corn silage... withstand highest pressures of grass silage. Tight walls, impervious to moisture, retain juices, prevent drying out and spoilage, reduce feed costs. Low first cost and minimum upkeep. Last a lifetime.

"ABSORBINE

kept my horse at work"

says Martin Paul of Pewee Valley, Kentucky

"I thought my horse would be laid up for a week with shoulder gall 'til I tried Absorbine. It helped give relief in a few hours. I'd recommend Absorbine to any farmer like myself."

Yes, there's nothing like Absorbine for

lameness due to shoulder gall, strains, puffs, bruises. Absorbine is not a "cure-all," but a time-proved help in relieving fresh bog spavin, windgall, collar gall, and congestive troubles.

A stand-by for over 50 years, it's used by many leading veterinarians. Will not blister or remove hair. Costs only \$2.50 for a long-lasting bottle at all druggists.

W. F. Young, Inc., Springfield, Mass.

MANY NEVER SUSPECT CAUSE OF BACKACHES

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

SENSATIONAL NEW *Anti-Rust* FARM FUELS

prevent rust and corrosion
that clog fuel lines, pumps,
jets and damage fuel tanks

Condensation causes water to form daily in fuel tanks. This water rusts and corrodes your whole fuel system.

How fuel jet clogged by rust speck causes stalling, sluggish acceleration, sudden breakdown.

RD-119—the miracle anti-rust chemical now blended into all Sinclair fuels—stops rust and corrosion by coating your tank and whole fuel system with an invisible water-proof film.

So get top performance plus anti-rust protection—at no extra cost. Phone or write your local Sinclair representative today.

SINCLAIR

New Anti-Rust

GASOLINES • TRACTOR FUELS • HEATING OIL • KEROSENE

For better insect control use
NEW Sinclair Stock Spray!

POST YOUR FARM

and you will have the law clearly on your side. Our signs are printed on heavy fabric that withstands wind and weather and meet requirements of the Conservation Law.

The Question Box

I have some sweet clover and would like to harvest seed but do not know how to do it.

I am sorry to say that I have had little experience with the combining of sweet clover seed. Before the war we used to harvest a small amount in this area. Most of it was cut with a grain binder when the pods were about three-fourths brown, allowed to cure in the field in shocks for about a week, and then threshed with a conventional threshing machine. I saw one or two men during that time attempt harvest with a combine but shattering losses were quite high. It is possible that the newer combines may do a better job.

Where the combines that I saw operate were put in the field early enough so that shattering was not serious, the screens clogged from the green material that was always present. If your combine has a pick-up attachment, I believe it might be better to mow the sweet clover first with a windrow attachment on the mower, and then pick it up and thresh it with the combine.

Average yield in the seed producing areas is about two and one-half bushels per acre, but yields as high as five bushels are not uncommon. After threshing, the seed should usually be spread out on the floor in a comparatively thin layer until it is sufficiently dry so that no heating will result.

—G. H. Serviss.

Is it true that there are male and female plants in asparagus and that there is a difference in the yield?

Yes, that is true. Ordinarily the male plants yield heaviest primarily because some of the strength of the female plants goes to seed production. However, it does not seem to be feasible to identify and separate the plants at the time of setting them out. By the time they can be identified it is better to leave the female plants rather than to try to remove them.

What happened to the enthusiasm for edible soybeans which we heard so much about 10 years ago?

We can only report our experience which was that they were more difficult to shell than lima beans and not as palatable to the family. We grew them a couple of years and threw away a good part of the harvest, and then we concentrated our efforts on limas which we like much better.

Is there any truth to the idea that flies develop an immunity to DDT?

There is some doubt about this, but it is true that the flies which have the most natural resistance are the ones which live and breed. Therefore, new generations may inherit a resistance. Fortunately there is a new fly spray called "lindane" and if a fly should inherit a resistance to this, research will doubtless develop new ones.

I have some bittersweet but it does not bear fruit. Can you tell me why?
